FERMOY, a town in the east of Cork county, Ireland, chiefly on the right bank of the Blackwater, 19 miles north-east of Cork city. Its origin dates from the 12th c., when it was the seat of a great Cistercian abbey; but its present importance, which commenced in the end of last century, is due to Mr (afterwards Sir John) Anderson, who introduced mail-coaches into Munster. The hills to the south of the town rise in Knockinskeagh 1388 feet. F. is handsomely built and regularly laid out. A large ecclesiastical establishment (Roman Catholic), consisting of a church, a bishop's house, two convents with large schools, and a college with nearly 100 students, has recently been erected on a hill rising from the Blackwater. A bridge of 13 arches, built in 1689, crosses the river. Infantry and cavalry barracks for 3000 men crown the heights on the left bank of the river, and command one of the chief approaches to Cork. F. has a trade in agricultural produce. Pop. (1861) 6202, of whom about 5000 are Catholics.

FERN, MALE, a name given, in consequence of an erroneous notion, long since exploded, to a fern very common in the woods of Britain and of the continent of Europe, the *Aspidium filix mas* of some botanists, and *Lastræa filix mas* and *Nephrodium filix mas* of others. The fronds are bipinnate; the pinnules oblong, obtuse, and serrated; the sori near the central nerve, orbicular, kidney-shaped, and fixed by the sinus; the stipes and rachis chaffy. If

Common Male Fern.

not one of the very finest of our ferns, it is certainly a chief ornament of many of our woods, and a plant of very considerable beauty. The subterranean stem (rhizome) is officinal. It is about a foot long, and of the thickness of a quill, almost inodorous, with a nauseous sweet taste, becoming astringent and bitter. It was anciently used as an anthelmintic, and its use has been revived, especially in cases of tapeworm, in which it is believed to be very efficacious. Its anthelmintic powers are due to a thick, almost black volatile oil which it contains, and which is now itself also used in medicine.

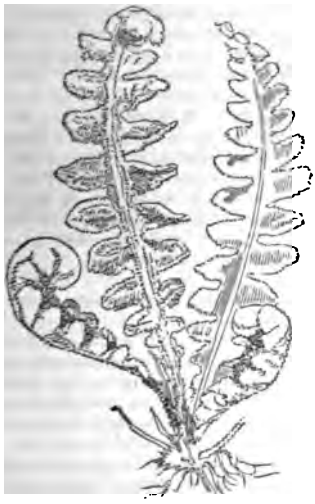
FERN, SWEET (*Comptonia asplenifolia*), a shrub of the natural order *Amentaceæ*, sub-order *Myricæ*, a native of the mountain-woods of North America, forming a small bush with linear pinnatifid, fern-like leaves. Its leaves have a powerful aromatic fragrance when rubbed. It is tonic and astringent, and is much used in the United States as a domestic remedy for diarrhœa.

FERNA'NDO PO, an island on the west coast of Africa, in the Bight of Biafra, is situated about 20 miles from the nearest point on the shore, and is about 44 miles long and 20 miles broad. The appearance of this island from the sea is exceedingly picturesque and beautiful. It is traversed by a mountain-ridge, which, in Clarence Peak, rises to the height of 10,650 feet, and is fertile, well-watered, and in many parts thickly wooded. Besides swarms of monkeys, some of which are of great size, the

contains many goats and sheep in a state of . The climate, always excessively hot, is ed more intolerable, during the rainy season, pestilential wind from the continent. The population, who are of negro race, are said ount to from 10,000 to 12,000 in number, and abit fifteen villages. The English, with the t of Spain, into whose hands F. P. had made an attempt in 1827 to form a settle- on the island, but abandoned it in 1834. In it was again taken possession of by Spain. olony has a population of about 900, most of are liberated Africans.

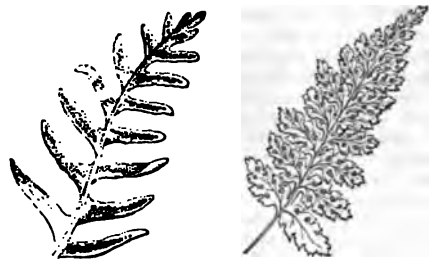
RNAN-NUNEZ, a small town of Spain, province of Cordova, and 10 miles south of wn of that name. It has some linen and n manufactures. Pop. 5500.

RNS (*Filices*), an order of acrogenous or cryp- ous plants, divided by some botanists into l orders; whilst some make *Filices* a sub-class, clude in it *Lycopodiaceæ*, *Marsileaceæ*, and *taceæ*. See these heads. F. are either her- s perennial plants, or more rarely trees, the ock or the stem producing leaf-like *fronds* called leaves), which are sometimes simple, mes pinnated, or otherwise compound, exhibit variety of form, and are generally coiled up *ate*) in bud (see accompanying illustration).



Ceterach Officinarum.

ronds are traversed by veins, generally of m thickness, which are simple or forked, or , sometimes produced from the sides of a or primary vein, sometimes from a primary n one side, sometimes radiating from the f a frond or segment of a frond. The fructi- n takes place either on the lower surface or margin of the fronds, and arises from the The spores are contained in capsules or ases (*theca*, *sporangia*), which are often nded with an elastic ring, and are either or covered with a membrane (*involucre* or *um*), and are generally clustered in round or ted or kidney-shaped masses (*sori*). The n of the frond is sometimes folded so as to the spore-cases, and sometimes, as in the ring Fern (*Osmunda*) (q. v.), the fertile part e frond is so transformed that its leaf-like cter entirely disappears, and it becomes a spike nicle. The spore-cases burst at their circum- ference, or longitudinally, or irregularly. Moving spiral filaments exist in F., but their functions in connection with reproduction are not well known



Ferns:
Shewing the Sori on the back of the Fronds.

The reproduction of F. has been the subject of much investigation and discussion, and supposed discoveries of sexual organs have been announced, but satisfactory evidence of their nature has not been obtained.—The number of known species of F. is about 2500. They are found in all parts of the world, but are fewer towards the poles than within the tropics, and fewer in continental than in maritime countries, abounding exceedingly in mountainous tropical islands, as in Jamaica. Many of them delight in moisture and shade, although some are found in the most exposed situations. Some of them resemble mosses in size and appearance; whilst Tree Ferns (q. v.) resemble palms, and sometimes attain a height of forty feet. A few are climbers. One climbing species (*Lygodium palmatum*) is found in North America as far north as Boston.—F. are divided into *Polypodieæ*, *Hymenophylleæ*, *Gleicheniaceæ*, *Schizæaceæ*, *Osmundeæ*, *Danæaceæ*, and *Ophioglosseæ*, of which sub-orders (or orders) the first, second, fifth, and seventh alone contain British species, and the first contains a great majority of all ferns.—The root-stocks of some F. contain so much starch that they are either used as food, or food is prepared from them, particularly those of the Tara (q. v.) Fern in New Zealand and Van Diemen's Land, and those of *Aspidium* (or *Nephrodium*) *esculentum* in Sikkim and Nepal; also the stems of some of the tree-ferns, as of *Cyathea medullaris* in New Zealand, and *Alsophila spinulosa* in India. The young and tender fronds of some F. are occasionally used as pot-herbs in the Highlands of Scotland, Norway, the Himalaya, &c. The fronds are generally mucilaginous, slightly aromatic and astringent. Those of some species of Maidenhair (q. v.) are used for making *capillaire*; whilst the bitter and astringent root-stocks of some F. are occasionally used in medicine, as those of the Male Fern (see FERN, MALE) and the Peruvian *Polypodium Calaguala*, particularly as anthelmintics. The fronds of a few species are delightfully fragrant.—The cultivation of F. is now in many places successfully conducted on a somewhat extensive scale, both in the open air and in hothouses; and to such an extent has the occupation of fern-collecting reached, that many excellent treatises on this subject alone have been written and elaborately illustrated. Amongst others, we may mention *British Ferns* (8s.), published by Routledge, London, as an excellent handbook; while the magnificent Nature-printed work, published in 2 volumes, royal 8vo, by Bradbury and Evans, supplies all needful information. Wardian cases, filled with them, have also become common, and are most pleasing ornaments of apartments. The principal species will be noticed under their particular heads.

FERO'ZÉ PORE (so called from its founder, Feroze Toghluk, who reigned in Delhi from 1351 to 1388) stands about 3 miles from the left or south-east bank of the Sutlej, in lat. 30° 55′ N., and long. 74° 35′ E. At one time, a large and important town, as its massive fortifications and extensive ruins still indicate, it had sunk into poverty and insignificance, before it actually came, in 1835, into the possession of the English. Since then, the place has regained much of its former consequence, holding out, with its wide streets and its colonnaded bazars, the promise of a grand emporium of commerce. Politically, too, F. P. has become prominent under British supremacy, having been a starting-point, whether for war or for negotiation, in many of our dealings with Afghanistan and the Punjab. In connection with this feature in its history, the city contains a monumental church in honour of the memory of those, both privates and officers, who fell in the various conflicts with the Sikhs. The population is about 10,000.—The *district* of the same name has an estimated area of 200 square miles, and a population of 20,000. It is now for the most part either barren or covered with jungle, but the ruins of towns and villages indicate that it must have been at one time both more fertile and more populous.

FERO'ZÉ SHAH, a village apparently within the district of Feroze Pore, and situated about 10 miles east-south-east of the town of that name, is in lat. 30° 52′ N., and long. 74° 50′ E., lying about 12 miles from the left bank of the Sutlej. It claims notice mainly as the scene of the second in order of the four great battles of the first Sikh war. The conflict in question, which lasted two days, took place in December 1845, ending in the rout of the natives and the capture of their intrenchments. The British army was commanded by Sir Hugh Gough and Sir Henry Hardinge; and, as in the victory of Moodkee, gained only three days before, it sustained heavy loss.

FEROZE SHAH CANAL, a work, including its branches, of 240 miles in length, demands detailed notice as well for its historical interest as for its economical value. It dates back as far as 1356, owing its origin, as well as its name, to Feroze Toghluk, king of Delhi. Viewed as a whole, it leaves the right bank of the Jumna in lat. 30° 19′ N.; and, after sweeping round so as to skirt Sirhind, a territory on the Sutlej, it rejoins its parent stream at Delhi in lat. 28° 39′, thus measuring, in mere difference of latitude, 100 geographical miles. This artificial water-course, intended principally for the purposes of irrigation, seems to be equally creditable to native enterprise and native skill. But, as nothing of the kind appears to be permanent in the East, this noble channel was so much neglected, that, in the beginning of the 17th c., it was cleared out by Vizier Ali Murdan Khan, who, in point of fact, was the first to carry it, through its lower half, back into the Jumna. Finally, the entire line has, during this 19th c., been again repaired and improved by the British government. In the light of the drought and famine of 1860, the importance of such undertakings as the Feroze Shah Canal can scarcely be overrated.

FERRANDI'NA, a town in the south of Italy, in the province of Basilicata, stands on a height on the right bank of the Basento, 35 miles east-south-east of Potenza. Good wine is produced in the neighbourhood. Pop. about 6000.

FERRA'RA, the most northern of the Italian provinces that are washed by the Adriatic. It extends immediately south of the Po, between the main branch of which, and the Po di Primaro, it is for the most part enclosed. As one of the old delegations, it had an area of 1180 square miles, with a population amounting to 244,524; but according to the official *Statistica Administrativa del Regno d'Italia*, published at Turin in 1861, the province had undergone certain modifications, and its population in 1861 stood at 194,161. The area consists, for the most part, of swamp and lake; and many rivers and canals intersect it. Between the Po di Volano and the Po di Primaro, the marshes become very extensive, and receive the name of *Valli di Comaccio*. This province produces great quantities of fish, affords good pastures, and carries on a great trade in corn and hemp. It was at one time a dukedom under the House of Este, but on the failure of a legitimate male heir, Pope Clement VIII. wrested it from this family, and annexed it to the States of the Church in 1598. It became part of the kingdom of Italy in 1860.

FERRA'RA, an ancient city of Italy, capital of the province of the same name, is situated in a low marshy plain in the delta of the Po, and about 4 miles south of the main branch of that river, 28 miles north-north-east of Bologna, and 40 miles north-west of Ravenna. F. was first made a walled city by the exarch of Ravenna about the close of the 6th c., and in the following century (661 A. D.) became the seat of a bishop. In the middle ages, it was the great commercial emporium of Italy, and the seat of a court renowned throughout Europe; but now the city has a peculiarly deserted and melancholy appearance; grass grows on the pavements of its broad and regular streets, and its churches and palaces are either rapidly falling, or have already fallen into decay. It is surrounded with walls, and is strengthened by bastions and a fortress. The old castle, or ducal palace, once the residence of the Dukes of Este, but recently, until 1860, occupied by the papal legates, rises like a huge rock, is strengthened with corner-towers, and surrounded by a ditch. Its ecclesiastical edifices, which are very numerous, and of which the churches of Santa Maria degl' Angeli and of San Benedetto are the most remarkable in point of architecture, are rich in paintings by the great masters of the Ferrara and Bologna schools. Besides their valuable paintings, these churches contain numerous sculptured monuments of famous persons; the church of San Francesco has a curious echo, with sixteen reverberations. The university, founded in 1264, was reorganised in 1402, closed in 1794, and reopened in 1824. It is in high repute as a school of medicine and jurisprudence, and is attended by about 200 or 300 students. It has an excellent library, which, besides a variety of MSS., missal paintings, and old editions of printed works, contains several of the works of Tasso and Ariosto in their own hand. F. is specially remarkable for its art associations. Under the patronage of the Dukes of Este, it produced a school of painters who rank high in the history of art; while in literature the name of F. is immortalised through its connection with those of Tasso, Ariosto, and Guarini. At the period of its greatest prosperity, F. had about 100,000 inhabitants, but at present it has a population of only 30,928.

In 1849, the Austrians took possession of the town, but were compelled to abandon it at the commencement of the Italian campaign in June 1859. In April 1860, F., with the state of which it is capital, was formally annexed to the kingdom of Italy under Victor Emanuel.

FERRA'RI, GAUDENZIO, sprung from a family which followed a career of art as if by inheritance, was born at Valdugia, in the Milanese, in 1484.

r of Andrea Scotto and Perugino, and the ssociate and friend of Raphael, his own may be said to have caught some inspir- n each of these three great masters, while unmistakably reflect genius of a bold, ed originality. The chief characteristics tyle are correct and vigorous delineation, rividness and delicacy of colouring, noble form and attitude, and unsurpassable art assic disposal of drapery. Being one of laborious artists of his day, he has executed ble paintings both in *fresco* and in oil, the art of which are possessed by the Lombard

His most comprehensive work, the t Barallo, in Piedmont, represents the the 'Martyrdom of St Catherine,' to owes his brightest fame, is in the Milanese of paintings. He died in 1549, having ome good scholars, the chief of whom is iolario.

TATES are combinations of ferric acid weak unstable compound of iron and ith bases. See IRON.

EI'RA, ANTONIO, one of the classic poets gal, was born at Lisbon, 1528. He was at Coimbra, where he occupied himself study of the Italian and Latin authors, ecially Horace, whom he almost rivalled eness, but not in elegance of expression. ding for some time the office of a professor ra, he obtained a civil appointment of some e at the court of Lisbon. He carried to the elegiac and epistolary styles, already l with success by Sá de Miranda, and ted into Portuguese literature the epi- m, the epigram, ode, and tragedy. His *Ines* is the second regular tragedy that appeared revival of letters in Europe, the first being *nisba* of Trissino. It is still regarded by uguese as one of the finest monuments literature, for its sublime pathos and the of its style. The works of F. are not , as his official duties left him little leisure. 1569. All his works are distinguished by and depth of thought. His expression rather than sweet, is extremely animated, of that fire which elevates the mind and e heart. His efforts after brevity, how- quently led him to sacrifice harmony to

His *Poemas Lusitanos* were first pub- Lisbon, 1598, and the *Todas as obras* in 1771. Compare Sismondi's work, *La e du Midi* (Paris, 1813), and Bouterwek's *der neuern Poesie und Beredsamkeit* (12 1801—1819).

ET (*Mustela furo*), an animal of the weasel (*Mustelidæ*), so nearly allied to the Polecat at many regard it as a mere domesticated It is of rather smaller size, the head and g about fourteen inches long, the tail five d a half, the muzzle rather longer and more he head rather narrower; and the colour fferent, being yellowish, with more or less n some parts, there being two kinds of hair, r partly white, the shorter yellow. The pink. It is, however, much more suscep- old than the polecat, and requires careful from it in climates where the polecat is ative. It was imported into Europe from d was well known to the Romans, being employed, as it still is, in catching rabbits, purpose it is often sent into their bur- zzled, or 'coped,' by means of a piece of drive them out into nets, or, with a string to it, it is allowed to seize a rabbit in the burrows, and is then drawn out, nolding it fast The usual plan, however, is to let the F. have free range of rabbit-holes unmuzzled. Ferrets are generally kept in boxes, and attention to warmth

Ferret (*Mustela furo*).

and cleanliness is essential to their health. They are capable only of partial domestication, acquiring a kind of familiarity with man, and submitting with perfect quietness to his handling, but apparently never forming any very decided attachment; and they never cease to be dangerous if not carefully watched, especially where infants are within their reach. If allowed any measure of freedom, they are ready to attack poultry, and kill far more than they can devour, merely sucking the blood. They generally breed twice a year, each brood consisting of six or nine. The female sometimes devours the young ones, in which case another brood is speedily produced.

FERRIDCYA'NOGEN is a compound organic radical which has not been isolated, but which forms with potassium a well-known compound used in the arts, called the ferridcyanide of potassium or red prussiate of potash. In the preparation of this salt, a solution of ferrocyanide of potassium is acted on by a stream of chlorine gas until the colour of the liquid passes from yellow to deep red, and thereafter, on evaporation and cooling, fine red crystals are obtained. The chlorine (Cl) acts upon two equivalents of the ferrocyanide of potassium (twice $2K,FeC_6N_3 = 4K,Fe_2C_{12}N_6$), removing one equivalent of potassium (K), forming chloride of potassium (KCl), whilst the remaining constituents combine together, and produce one equivalent of ferridcyanide of potassium ($3K,Fe_2C_{12}N_6$, or 3K, Fe_2Cy_6, or 3K,Fdcy). The latter is known commercially in red crystals, readily soluble in water, and yields a fine deep *Prussian blue* (Turnbull's blue) when mingled with solution of protosulphate of iron (green vitriol), and hence is used largely in dyeing and calico-printing.

FERRIER, JAMES F., LL.D., a metaphysician, was born in Edinburgh, November 1808. After studying at Oxford, where he took the degree of B.A. in 1832, he was admitted to the Scottish bar in 1833. In 1842, he was elected to the chair of History in the university of Edinburgh, and in 1845 to that of Moral Philosophy in the university of St Andrews. Mr F. early attracted notice by some metaphysical essays, which appeared in *Blackwood's Magazine*; and in 1854 he published the *Institutes of Metaphysics*, in which he endeavours to construct a system of idealism in a series of propositions, demonstrated after the manner of Euclid. He has

lately edited the collected works of his father-in-law, the late Professor John Wilson of the University of Edinburgh.

FERRIER, Susan Edmonston, aunt of the former, a successful novelist, was born in Edinburgh in 1782, and died in 1854. Her father, James Ferrier, one of the principal clerks of the Court of Session, and the colleague in that office of Sir Walter Scott, lived on terms of intimacy with the wits and literati of his day in Edinburgh, and Miss F.'s talents and quick powers of observation were early called into play in the midst of the literary society in which her youth was passed. Her first work, *Marriage*, appeared in 1818, and this was followed by *The Inheritance* (1824), and *Destiny* (1831). The merit of these tales, which are characterised by genial wit, a quick sense of the ludicrous, and considerable ability in the delineation of national peculiarities, is sufficiently proved by the fact, that they have stood their ground, notwithstanding the enormous number of works of fiction which have flowed from the press since their publication. Miss F. enjoyed the esteem and friendship of Sir Walter Scott, who, in the days of his strength, repeatedly gave expression to his appreciation of her talents, and who derived consolation from her sympathy in the season of gloom which darkened the close of his life.

FE'RRO, or **HIE'RRO**, the most western of the Canary Isles, was formerly considered the most westerly point of the Old World, and for this reason geographers at one time took it as the point of departure in reckoning longitudes, as is still done by the Germans and others. Hence, in all probability, originated the present hemispherical division of the maps of the world, F. being taken as the boundary-line. The English, however, have adopted the meridian of Greenwich as the first meridian, and in this their example is followed by the Dutch, and in sea-charts generally; area, 82 square miles; pop. 4400. The meridian of F. is 18° 9′ west of that of Greenwich. See Longitude.

FE'RROCYA'NOGEN is a compound organic radical, generally regarded by chemists as existing in ferrocyanide of potassium, or the yellow prussiate of potash, but which has not yet been obtained in a separate state. The principal compound of ferrocyanogen is the ferrocyanide of potassium, which is prepared by heating to redness in a covered iron pot a mixture of 3 parts by weight of nitrogenised matter, such as dried blood, hoofs, parings of hides, scrapings of horn, or the flesh of old or diseased horses and other animals, 3 parts of carbonate of potash, and one part of iron filings. The carbon, nitrogen, and iron combine together, and form ferrocyanogen (FeC_6N_3 = $FeCy_3$, or Cfy), which, at the same time, unites with the potassium, and produces ferrocyanide of potassium, or yellow prussiate of potash 2K.Cfy). The compound which is obtained from the heated iron vessel is impure, but by repeated solutions in hot water, and recrystallisation on cooling, the salt is obtained pure in fine large tabular crystals of a lemon-yellow colour. The ferrocyanide of potassium is largely used in dyeing and Calico-printing (q. v.) in the production of many shades of *Prussian blue*; and when it is treated with sulphuric acid, and subjected to heat applied, hydrocyanic or prussic acid (HC_2N = HCy) distils off from the mixture. The ferrocyanide of potassium is characterised by giving no indication of the presence of iron in its radical on the application of any of the tests for iron. It gives a light-blue precipitate on the addition of a solution of proto-sulphate of iron; a dark blue precipitate with perchloride of iron; a ruddy brown precipitate with sulphate of copper; and a white precipitate with acetate of lead.

FE'RROL, a strongly fortified seaport town of Spain, in Galicia, is most advantageously situated on a narrow arm of the sea, 14 miles north-east of the town of Corunna. It was originally a fishing-town, until selected for its natural advantages as a seaport by Charles III., who erected here what was at one time the finest naval arsenal in the world, and destined it exclusively for the Spanish royal navy. The entrance to the harbour, formed by a narrow inlet from the Bay of Betanzos, admits of the approach of only one ship-of-the-line at a time, and is defended by the castles of San Felipe and Palma. The town is defended by walls and fortifications, is, on the whole, regularly built, and has several squares and pleasing alamedas or public walks. The arsenal, in which fifteen ships-of-the-line could be simultaneously built, covers a great space; and though now in a somewhat ruinous condition, is still the most important in Spain. F. has manufactures of hats, naval stores, hardwares; and exports corn, brandy, vinegar, and fish. Pop. (including the garrison) 16,640.

FE'RROTYPE, a term applied by Mr Robert Hunt, the discoverer, to designate some photographic processes, in which salts of iron play an important part. Like many of the earlier paper processes, the ferrotype is far inferior in sensibility to the more modern collodion process or Archerotype, and is on that account seldom if ever used even for landscapes.

FERRU'GINOUS is a term employed in chemistry to denote the presence of iron in natural waters, minerals, &c. It is synonymous with the term chalybeate. See Chalybeate Waters.

FERRY (from Sax. *faran*, Ger. *fahren*, to move, proceed, allied to the Lat. *fero*, Eng. *bear*), a passage by boat across water. By the law of England, a man may have a right to keep a boat and to ferry passengers for a consideration, just as he may have a right to hold a fair, either by royal grant, or by prescription, from which a royal grant at some previous time will be presumed. No other title, unless conferred by act of parliament, will suffice, for no fair, market, or ferry can be set up without licence from the crown either actual or presumed. The possessor of such a title need not necessarily be the proprietor of the soil on which the market is held, or of the water over which the right of ferry is exercised. In the latter case, he need not be the proprietor of the soil on either side of the river, though he must possess such rights over it as will enable him to embark and disembark his passengers. As fulfilling his part of the bargain with the public, the owner of a ferry is bound to keep a boat fit for the purpose of carrying passengers, whilst on the other hand he has a right of action not only against those who refuse or evade payment of the toll or passage money, but against those who disturb his franchise by setting up a new ferry so near as to diminish his custom—Stephens, i. pp. 663, 664. It has been more than once decided, that the erection of a second ferry in such circumstances is a nuisance to the owner of the old one, who is bound to keep his ferry in readiness for the use of the Queen's subjects, a burden which is not shared by his rival (North and South Shields Ferry Co. *v.* Barker, 2 Exch. 136). The rule in Scotland as to rival ferries is the same: but a grant of ferry from the crown to one heritor does not prevent his neighbours from keeping private boats for the transport of themselves and their families and servants. Where ferries have not been given out by royal gift, either express or presumed

described, they are *inter regalia*, i. e., they
the crown for the public benefit. In
they are under the management of the
of the roads connected with them, or are
by the justices of the peace for the county,
cial acts of parliament. By 8 and 9 Vict.
ain rules are laid down for the regulation
The act is confined to Scotland.
n rowing-boats are generally used for

ineering. An important element in the
is the determination of the right point of
nt for the rope. In the case of a wide
rope or chain requires to be of consider-
th, and must be supported by movable
by small boats.

'ILISA'TION OF PLANTS. See FECUN-

, or FASA, a town of Persia, in the province
80 miles south-east of Shiraz, is situated in
ain defile, is of considerable size, and is said
a population of 18,000. It has manufac-
silken, woollen, and cotton fabrics, and
some trade in a superior kind of tobacco which is grown in the vicinity.

FE'SCENNINE VERSES, a branch of the indigenous poetry of ancient Italy, were a sort of dialogues in rude extempore verses, generally in Saturnine measure, in which the parties rallied and ridiculed one another. It formed a favourite amusement of the country-people on festive occasions, especially at the conclusion of harvest and at weddings. As was to be expected, it often degenerated into licentiousness, that at last required the curb of the law. The Fescennine verses are usually considered to be of Etruscan origin, and to have derived their name from the Etrurian town Fescennium; but there is little probability in this etymology. Verses of this sort were and are popular to this day all over Italy. The name is more likely connected with *fascinum*, fascination, enchantment, or the evil eye, against which the chanting of verses may have originally been intended as a protection.

FESCUE (*Festuca*), a genus of grasses, very nearly allied to Brome-grass (q. v.), and having in some species a loose, in some a contracted panicle; the spikelets many-flowered, with two unequal glumes, which they much exceed in length; each floret having two lanceolate paleæ, the outer palea rounded at the back, and acuminate or awned at the summit; the stigmas growing from the apex of the germen. The species are numerous, and are very

Fescue Grass (*Festuca pratensis*):
a, germen and stigmas; *b*, a spikelet.

widely diffused over the world, both in the northern and southern hemispheres. Among them are many of the most valuable pasture and fodder grasses. None are more valuable than some of the British species. MEADOW F. (*F. pratensis*), a species with spreading panicle and linear spikelets, from two to three feet high, common in moist meadows and pastures of rich soil, in Britain and throughout Europe, in Northern Asia, and in some parts of North America, is perhaps excelled by no meadow or pasture grass whatever. It is suitable both for

alternate husbandry and for permanent pasture.—SPIKED F. (*F. loliacea*)—by many botanists regarded as a variety of Meadow F., although it departs from the habit of the genus in having the branches of the panicle reduced to a single spikelet, and forming a two-rowed raceme or spike—is regarded as an excellent grass for rich moist meadows.—HARD F., (*F. duriuscula*), a grass from one foot and a half to two feet high, with a somewhat contracted panicle, mostly on one side, is one of the best grasses for lawns and sheep-pastures, particularly on dry or sandy soils. Several varieties are known to seedsmen and farmers.—CREEPING F. or RED F. (*F. rubra*) is probably a mere variety of Hard F., being distinguished chiefly by its extensively creeping root, which particularly adapt it to sandy pastures, and to places liable to occasional inundations.—SHEEP'S F. (*F. ovina*) is a smaller grass than any of these, not generally exceeding a foot in height, and often much less, abundant in mountainous pastures, and especially suitable for such situations, in which it often forms a principal part of the food of sheep for many months of the year. It is common in all the mountainous parts of Europe, and in the Himalaya, it is also a native of North America, and species very similar, if not mere varieties, abound in the southern hemisphere. Its habit of growth is much tufted.—TALL F. (*F. elatior*) is a grass of very different appearance, four or five feet high, with spreading much branched panicle, growing chiefly near rivers and in moist low grounds, and yielding a great quantity of coarse herbage, which, however, is relished by cattle.—Of foreign species, which have been introduced into Britain, *F. heterophylla* best deserves notice, a tall species with narrow root-leaves, and broad leaves on the culm; a native of France and other parts of the continent of Europe, and pretty extensively cultivated in some countries, particularly the Netherlands.—All these species are perennial.—Some small annual species occasionally form a considerable part of the pasture in dry sandy soils, but are never sown by the farmer.—A Peruvian species (*F. quadridentata*), called *Pigouil* in its native country, and there used for thatch, is said to be poisonous to cattle.

FESS. The fess in heraldry consists of lines drawn horizontally across the shield, and containing the third part of it, between the honour point and the nombril. It is one of the honourable ordinaries, and is supposed to represent the waist-belt or girdle of honour, which was one of the insignia of knighthood.

PER FESS.—A shield, or charge in a shield, is said to be *party per fess*, when it is horizontally divided through the middle, or, as the French say, simply *coupé*.

FESSWISE is said of a charge placed *in* fess; that is to say, horizontally across the shield.

FE'SSLER, IGNAZ. AURELIUS, a celebrated Hungarian historian, was born in 1756, in the county of Soprony or Oedenburg. During a long life full of adventures, F. served successively the Emperor Joseph II., the King of Prussia, and the Emperor of Russia; and also held the office of Professor of Oriental Languages at different universities. He died at St Petersburg 15th December 1839. Among his works of a lasting value are—*Attila* (Breslau, 1794), *Mathias Corvinus* (2 vols. 1793; 2d edition, 1806, Breslau), and the History of the Hungarians, &c. (*Geschichte der Ungern und deren Landsassen*, 10 vols., Leip. 1812–1825). His autobiography, entitled Recollections of my 70 Years' Pilgrimage (*Rückblicke auf meine 70 jährige Pilgerschaft*, Breslau, 1826; 2d edit. Leip. 1851), is also a very interesting work. Deep learning, coupled with a rare beauty of style, render F.'s works (all written in German) attractive in the highest degree.

FE'STIVAL PLAYS. See MORALITIES, MIRACLE PLAYS, MYSTERIES.

FE'STIVALS, or FEASTS (Lat. *festum*, probably from the same root as *fast* (q. v.); according to some, from Gr. *hestia*, hearth), a term denoting certain periodically recurring days and seasons set aside by a community for rest from the ordinary labour of life, and more or less hallowed by religious solemnities. Originating within the narrow circle of the family, and commemorating momentous events affecting one member or all, these pauses became more frequent, and of wider scope, as the house gradually expanded into a tribe, a people, a state. The real or imaginary founders, legislators, heroes, became objects of veneration and deification, and the salient epochs of their lives the consecrated epochs of the year. National calamities or triumphs were, in the absence of annals, best remembered by corresponding general days of humiliation or exultation. Earliest of all, however, did the marked stages in the onward march of nature: spring and autumn, seed-time and harvest-time—symbols of life and death; the solstices—turning-points of summer and winter; the new moon and the full moon; the termination of cycles of moons and cycles of years, present themselves as opportune halting-places for man himself. No less were the all-important periodical rises of fertilising rivers, and the anniversaries of importations and inventions of new implements for the better cultivation of the soil, or tending of the flocks, befittingly celebrated. The inherent human tendency towards referring all things of graver import, life and death, abundance and want, victory and defeat, to a higher power, could not but infuse a religious feeling into epochs so marked. Fostered and guided by priests and lawgivers, this property of our nature erelong found its expression in common sacrifices, prayers, and ceremonies, consecrated to the various superior and minor deities who presided over and inhabited the elements of the visible and invisible creation, and who, working all the changes within them, acted, each in his sphere, as a partial providence over man. According to the event which called them forth, these festivals were mournful or joyous, jubilant or expiatory. Even when sorrow was to be expressed, the mortification of the body did not always suffice, but plays, songs, dances, and processions full of boisterous mirth, were resorted to—as in the festivals of Isis at Busiris, of Mars at Papremis, in the Adonia of Egypt, Phœnicia, and Greece—because the divine wrath or sorrow was, like that of man, to be changed into satisfaction. Besides the relation between the common tutelary deity and those he protected, the bond also by which the otherwise disconnected members of the body politic were held together was, by means of these festive gatherings, periodically brought in view, and invested with greater strength and importance. Apart, however, from this their historical, astronomical, religious, and political end, festivals served another purpose—that of growing civilisation. It was the glowing spirit of emulation which, stimulating the gifted in mind and body to strive for the festive laurel in contests of genius and skill, in honour of the gods, and in the face of all the people, matured all that was noble and brilliant within the community. Archaic rudeness and rustic extravagance became refined grace and classic harmony. The stirring drama, the glorious anthem, the melodious dance, the elegant game, which accompanied the festive sacrifice of some nations at their highest stage of development, had arisen out of those very mimicries and shouts, rude

rage beyond expression, of generations not fore them. Enthusiastic, wild, metaphysical invested the countless days consecrated to fied stars, plants, animals, and ideas; to the › Ammon, Kneph, Menes, Osiris; to Horus, tha, to Ptah, with a mystery, sensuality, ournfulness always exaggerated, sometimes ous. The Hindu, no longer daring to offer sacrifices, shews his odd and cruel mate- by throwing into the waves, on his festival s, some of his costliest goods, gold, jewels, ts, and instruments; while in the licentious- d debaucheries perpetrated on the festival of he god of procreation, or on the Bacchantics goddess Bhavani, he exceeds even those of yptians on their Neitha feasts at Bubastis, e Greek worship of Venus in her Cyprian

Phœnicians and Assyrians, Babylonians rygians, according to the little we know of ligions and manners, appear to have feasted, i, propitiated, mourned all at different times, the way most befitting their several natures, the case of those gods and festivals which d in common.

ncient Persians alone of all nations had no s, as they had no temples and no common . These 'Puritans of Polytheism,' who ped the sun only, and his representative ı, fire, scorned show and pomp, and large s gatherings. A striking contrast to them ed, in another hemisphere, by the ancient ns, who were found to possess one of the chly developed calendars of festivals, scien- divided into movable and immovable feasts. strange and singular phenomenon among s, we may also mention here that 'of the r Souls,' celebrated among the wild tribes of America. At a certain time, all the graves ptied, and the remains of the bodies buried e last festival are taken out by the relatives, rown together into a large common mound, reat rejoicings and solemnities, to which all ghbouring tribes are invited.

e had received the types of civilisation, , and art from Egypt and the East generally, developed them all in a manner befitting her s clime and the joyous genius of her sons. time of the *Iliad*, two principal festivals he harvest and the vintage seem to have lebrated (ix. 250); but they increased with pidity, that in the days of Pericles they had the number of a thousand; some indeed an epitome only of their memorable feats s, others restricted to one town, or pro- or profession, or sex, or to a few initiated, rring only at intervals of several years; re were still so many kept by the whole that ancient writers bitterly denounce s merry beginnings of a sad end, as the it sure ruin of the commonwealth. Their ings proved true enough; and yet Greece certainly never have reached the highest mong nations, as far as literature, the arts, ilosophy are concerned, had it not been constant contests attached to her many s. She resisted Asia, because her citizens lways alert, always ready. The religious the festival—homage offered to personified consisted mostly in the carrying about of the f the day to the sound of flute, lyre, and and in a sacrifice, followed by a general pon certain portions of the animal offered. ollowed scenic representations symbolising ds of the gods; after which came games and s of all kinds—foot, horse, and chariot races, , boxing, throwing, wrestling, &c. Separate accounts are given of some of the more remarkable Greek festivals. See BACCHUS, ELEUSINIAN MYSTERIES, PANATHENAIA, &c. There were also special times set aside for the 'Holy Games' proper. The most important of these were the Olympian, the Pythian, the Nemean, and the Isthmian. (See these heads.) As all these festivities were provided out of the public purse—from the confiscated estates of the 'tyrants' and political delinquents—the individual did not suffer more than a welcome interruption of his usual business, and under that genial sky the penalty to be paid for occasional indolence was not too heavy.

Rome, founded amid pastoral festivities in honour of some god Pales, adopted and acclimatised, as she went on from conquest to conquest, the foreign deities, exactly as, with her usual prudence and practical sense, she conferred her right of citizenship on her foreign inhabitants, and on whole nations subjected to her rule. Her yoke was thus less galling to the new provinces, while at the same time the populace at home found sufficient distraction in the many ancient and newly imported festivals, with their quaint rites and gorgeous pageantry. Yet the Romans—more parsimonious and abstract by nature than the vivacious Greek neighbours from whom they had accepted the greatest part of their religion—never exceeded in their festivals the number of one hundred, and in these, again, a distinct line was drawn between civil and religious ones. Some of the principal religious festivals were the Sementinæ, on the 25th of January—the rural festival of the seed-time; the Lupercalia, in honour of Pan; the Cerealia; the night festival of the Bona Dea; Matronalia; Minervalia; &c. To the purely civil ones belong the Janualia, the 1st of January and the new-year's day, when the new consuls entered upon their office, and friends used to send presents (*strenæ*) to each other; the Quirinalia, in memory of Romulus, deified under the name of Quirinus; and the Saturnalia, in remembrance of the golden age of Saturn, beginning on the 19th of December. The celebration of these festivals was in all respects imitated from the Greeks, with this difference only, that the games connected with them became, with the pre-eminently bellicose Romans, terribly lifelike images of war. Their sham sea-fights; their pitched battles between horse and foot, between wild beasts and men; their so-called Trojan games, executed by the flower of the nobility; their boxing-matches (with gloves that had lead and iron sewed into them): circus, arena, and amphitheatre gave, especially in later times, the greater satisfaction the greater the number of victims.

It is one thing only that monotheism has in common with polytheism with respect to its festivals—namely, that they are with each the religious expression of human joy or human sorrow. But if the former, with a dim misgiving of some awful and supreme power, invited the multifarious governors of the many provinces of nature to partake, as guests, of bodily and intellectual feasts, *together* with their hosts; monotheism, in binding up all fear and all hope, all gratitude and all awe, which moved the heart of man, in one almighty Creator, Mover, and Maintainer of all things, celebrated its festivals in honour of this omnipresent Spirit with a veneration, a purity, and a lofty elevation, such as the worshippers of star, animal, or image never knew. With the first and strictest monotheists, the Hebrews, whose very existence as a nation was traced to the special and miraculous interference of this highest and only God, the remembrance of that great event, their liberation from Egypt, and the momentous period of preparation in the desert which followed it, mingled with almost all their religious

observances, and especially their festivals, and infused into them all a tone of deep and fervent gratitude; while at the same time it held ever before their eyes the cause of their nationality, and their aim and destiny 'to be a kingdom of priests and a holy people.' The Hebrew festivals, too, are of a historical, agricultural, astronomical, and political nature; but they mostly combine all these characteristics, and are always hallowed by the same religious idea, and the same piety and devotion to one and the same holy name. Connected with their festivals were no plays and no representations of a god's deeds, no games and no cruelty, no mystery and no sensuality, but the sacrifice of the day, and a special occupation with the divine law, were the visible signs of the exalted seasons. The influence of the number seven —an influence met with among most eastern nations —is seen in the recurrence of many of the Jewish solemnities. See SEVEN. The Sabbath, the first and most important of these septenary festivals, is treated of under its own head. Of the service in the temple, and of the way in which this and the other festivals were and are kept after the destruction of the temple, something will be said under HEBREWS and JEWS. The most exalted of new-moon festivals was that of the first day of the seventh month, 'the day of remembrance of the sounding' or 'of trumpets' (Lev. xxiii. 24), to which in later times, when the Seleucidian era was introduced (the Syrian year beginning with the autumnal equinox), the name of Rosh hashana (New Year) was given; notwithstanding that in Exodus (xii. 2) Nisan is spoken of as the first month of the year. After a period of six years of labour, the earth, too, was to celebrate a Sabbath-year; what it produced spontaneously belonged to the poor, the stranger, and to animals. It is remarkable that even Alexander the Great and Cæsar remitted the taxes of Judea in this year of *Shemitta* (abandoning). After a revolution of seven times seven years, the year of Jubilee or Jobel was to be celebrated, in which all the Hebrew slaves were set free, and all land which had been sold in the interval was restored to the former owners, in order that the original equilibrium in the families and tribes should be maintained intact. (These two festivals, however, were, according to the Talmud, not kept before the Babylonian captivity.) The pre-eminently agronomical and historical festivals were the three *Chaggim* (whence the Arab. *Hagg*, a pilgrim to Mecca)—viz., Pesach (Passover), Schabuoth (Feast of Weeks), and Succoth (Feast of Tabernacles), on which three every male was obliged to go up to Jerusalem and offer some of the first fruits, besides the prescribed sacrifices (see PASSOVER, &c.).

The postmosaic and exclusively historical festivals, Purim, the feast of Haman, Chanuca, the feast of the Maccabees, will be noticed in the articles on JEWS, and JEWISH RITES.

Only a cursory glance can be here taken of the Christian festivals, which are treated fully and separately under their various names. They were for the most part grafted, in the course of time, upon the Jewish and Pagan ones, but always with a distinct reference to Christ and other holy personages. The weekly day of rest was transferred from Saturday to Sunday, and called the Day of Joy, or Resurrection, just as the weekly Jewish fasts of Monday and Thursday were changed for Wednesday and Friday. See FASTS. For a long time, both Saturday and Sunday were celebrated, especially in the East. Two separate celebrations took the place of the Jewish Passover: the *Pascha Stauroximon* was the festival of the Death, the *Pascha Anastasimon* of the Resurrection of our Lord (see EASTER); and the festival of Pentecost, or the law-giving at Sinai, became the festival of the outpouring of the Holy Ghost and of the inauguration of the New Covenant.

In the course of the 4th c., two new festivals were introduced: Epiphany (q. v.), which originated in the East; and that of the Nativity or Christmas (q. v.). Circumcision, Corpus Domini, the festivals of the Cross, of Transfiguration, of the Trinity, and many others, are of still later date. The veneration felt for Mary as the 'Mother of God,' found its expression likewise in the consecration of many days to her special service and worship; such as that of her Presentation, Annunciation (Lady's Day), Assumption, Visitation, Immaculate Conception (q. v.), and many minor festivals, over and above the Saturdays, which in some parts were entirely dedicated to her, in order that the Mother might have her weekly day like the Son. Besides these, there were festivals of Angels, of Apostles, Saints, Martyrs (on the supposed anniversary of their death, called their birthday, *dies natalis*), of Souls, Ordinations, &c.

Celebrated at first with all the primitive simplicity of genuine piety, most of these festivals were ere long invested with such pomp and splendour that they surpassed those of the ancient Greeks and Romans. Burlesque, even coarse and profane representations, processions, mysteries, and night-services, were, in some places, although unauthorised by the general church, connected with them, and voices within the church loudly denounced these 'pagan practices.' Ordinances forbidding mundane music and female singers for divine service were issued, the vigils were transformed into fasts, days of abstinence and penance were instituted, partly as counterpoises, but with little result. Nor did the prodigious increase of these festive occasions, and the rigour with which abstinence from labour was enforced in most cases, fail to produce the natural results of indolence and licentiousness among the large mass of the people. Bitter and frequent were the complaints throughout Christendom; but although even men like Archbishop Simon of Canterbury (1332), Petrus de Alliaco, Nicolaus of Clemangis, did their utmost to obtain a reduction of these festive occasions, which overspread well-nigh the whole year, it was only after the most decided and threatening demands, such as that pronounced by the German Diet of Nürnberg in 1522, that Pope Urban was prevailed upon to reduce the number for Catholic Christianity (1642). Benedict XIV. (1742), Clement XIV. (1773), followed in the same direction. On the change produced both in their number and in the manner of their celebration through the Reformation, we must forbear to enlarge here.

The Christian festivals have been divided variously: into *feriæ statutæ* (returning annually at fixed times), *indictæ* (extraordinary, specially proclaimed), *duplicia* (double reminiscence, or of higher importance), *semiduplicia* (half double), &c. Another division is into weekly and yearly feasts, these latter being subdivided into greater and minor, or into movable and immovable. There is also a distinction made between *integri* (whole days), *intercisi* (half-days), &c.

The only trace of the ancient manner of dating a festival from the eve or vesper of the previous day —a practice discontinued since the 12th c., when the old Roman way of counting the day from midnight to midnight was reintroduced—survives in the 'ringing in' of certain days of special solemnity on the night before, and in the fasts of the vigils.

On some of the principal Mohammedan festivals, partly based upon those of the Jews and Christians, such as the weekly Friday, the Yom Ashoora (the Jewish Day of Atonement), the Birthday of 'the

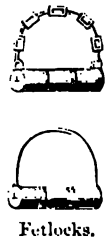
US, SEXTUS POMPEIUS, a Latin lexico-
f the third or fourth c. of our era, is one
st important ancient authorities we have
in language. He made an epitome of the
k of Verrius Flaccus, *De Verborum Sig-*
. This compilation, which was arranged
ally in 20 books, was still further abridged
d in the end of the 8th c. by Paul, son
fried, commonly called Paulus Diaconus.
work of Flaccus has unfortunately entirely
and of the abridgment made by Festus,
gle MS., and that in a deplorably imper-
ition, has survived. It came from Illyria,
nto the hands of Pomponius Laetus, a
hed scholar of the 15th century. It ulti-
ssed into the library of Cardinal Farnese,
, and is now preserved at Naples. The work,
f all its imperfections, is a grand storehouse
elge on points of mythology, grammar, and
s. All previous editions of F. are of little
mpared with that of K. O. Müller (Gött.
which he has made use of the Farnese MS.
r sources, distinguishing the value of each.

CHISM is the worship of a *fetich*. The
ich comes to us from the Portuguese, who
first Europeans that traded on the west
Africa, and who expressed their idea of the
of the natives by the Portuguese word
'magic.' This word, somewhat modified,
nto the French language, through Brosse's
Du Culte des Dieux Fétiches (Dijon, 1760),
and from him into German, through the medium of Pistorius (Stralsund, 1785). The term has now received European recognition. A fetich is anything in nature or art to which a magical power is ascribed, e. g., stones, carved figures, or certain parts of plants, animals, &c. In this general sense fetichism coincides with the belief in charms—a belief which is also to be found among monotheistic nations. The first step *out of fetichism*, is when ignorant tribes cease to be satisfied with believing merely in the magical power inherent in their fetiches, and begin to ascribe a certain conscious operation to the objects of their reverence, especially to the fetiches in the forms of beasts or men. In this way the fetich becomes an idol, and fetichism an idolatry. The lowest form of such idolatry is where the savage does not hesitate to throw away, to chastise, or even to destroy his fetich, if it does not appear to gratify his desires. The reverence for sacred woods, mountains, streams, &c., which formed part of the religion of the old Greeks, Celts, and Germans, is not fetichism proper, but rather belongs to the worship of nature.

FETID LIMESTONE, a variety of limestone which gives out, on being violently rubbed, or struck with a hammer, a smell like that of sulphuretted hydrogen gas. It has a dark colour, produced very probably from the perishable portions of the animals whose hard skeletons compose the rock. This animal matter may perhaps also be the cause of the disagreeable smell. Stinkstone or Swinestone have been likewise employed as characteristic names for this limestone.

FETLOCK, or FETTERLOCK. English heraldic writers speak of a horse fetlock or fetterlock, and represent it thus. It seems to have been an instrument fixed on the leg of a horse when put to pasture, for the purpose of preventing him from running off. In Scotch Heraldry, a hoop is usually substituted for the chain, and the fetlock is represented thus, as in the arms of Lokkert (Lockhart) of Barre, given by Sir David Lindsay; Argent, on a bend sable three fetterlocks *or*. Some branches of this family carry a man's heart within the fetterlock, one of the heads of it having accompanied Good Sir James Douglas with King Robert the Bruce's heart to Jerusalem (Nisbet, i. p. 325).



Fetlocks.

FEU AND FEU-DUTY. A feu may be described, in familiar language, as a right to the use and enjoyment of lands, houses, or other heritable subjects, in perpetuity, in consideration of an annual payment in grain or money, called *feu-duty*, and certain other contingent burdens called casualties of superiority (see CASUALTY). Though a feu was frequently used to express any kind of tenure by which the relation of superior and vassal was constituted, in its narrower meaning, which we have here indicated, and which is that in which it is now almost exclusively used, it was opposed, on the one hand, to those tenures in which the return consisted of military or other personal service (ward and the like), and on the other, to those in which the return was illusory (blanch), the only object of which was to preserve the relation of superior and vassal. A feu, in short, was a perpetual lease—a feu-farm, as it was often called—by which the tenant became bound to pay a substantial consideration, and his rights under which he might forfeit, as the penalty of non-payment. In the present day, the disposal of land in feu is practically a sale for a stipulated annual payment, equivalent to chief rent. It is in this light, accordingly, that feus are generally regarded in

Scotland; and as it is on this footing that almost all the house-property in towns and suburban villa-property is held, they form an important element in the proprietary relations of the country. The system of feuing property for building purposes seems to have several advantages over that of the long building-leases common in England. From its perpetual character, it gives to the person actually in possession a feeling of greater interest in the property, and usually leads him to erect more enduring structures than he probably would do under a lease. For as time runs on, the feu often increases in value, while the reverse must always be the case with leasehold property. Neither does it in any degree interfere with the letting of property on lease or otherwise. Almost all the houses in Edinburgh and the other towns in Scotland which are let, either on leases or from year to year, are held by those who are spoken of as their proprietors not in absolute property, but as feus. Modern feu-duties are in general paid in money. When the stipulation is for a duty in grain, the quantity is valued by fiar prices for the year (see FIARS), and paid in money accordingly. The deed transferring the land in feu from the superior to the vassal is called a feu-charter—a clumsily conceived and expensive document, which requires renewal in the case of heirs to vassals, or of parties to whom the vassal sells his right; and this repetition of the transaction, designated as 'entering with the superior,' forms the heavy drawback on the acquisition of land in feu, no matter how small in amount. Usually, the feu-charter reserves to the superior all minerals in the ground, and stipulates that the vassal shall build his house either in a particular style or of a certain value. By the Scottish stat. 1597 c. 246, it is declared that all vassals by feu-farm failing to pay their feu-duty for two years together, shall lose their right, in the same manner as if an irritant clause had been specially engrossed in their charter. But as the superior must obtain a decree declaring the loss of the vassal's right, before the forfeiture can take effect, if the feu is worth keeping, the duties, as a matter of course, will be paid. In the very rare case of the property having fallen off in value to the extent of rendering the feu a positive burden, it is possible that the irritancy may be voluntarily incurred. For the most part, land proprietors near towns and manufacturing villages are anxious to add to their annual rental by feuing grounds for building purposes. The rate of feu is very various, from as low as £8 to as high as £500 per acre per annum; a common rate is from £20 to £30 per acre. Whatever be the amount, it is payable by the feuar—not the tenant to whom the feuar may have let the property. When a building consists of several floors forming distinct dwellings, the feu-duty is allocated in certain proportions among the respective proprietors: the feuar to whom the lower floor belongs usually paying most. In properties of this kind, each is responsible only for his own share. Occasionally, feu-duties are offered for sale; and as a safe investment, bring from 25 to 30 years' purchase. In such cases, the vassal has an opportunity of extinguishing his feudal tenure, and becoming the superior. There are also instances of vassals sub-feuing. It is customary in feuing building lands for the superior to make the roads and drains. Relieved of this obligation, and getting possession of a site on a mere prospective annual payment of perhaps only a few shillings, the feuar has an undoubted advantage; looking, however, to the cumbersomeness and cost of the feu-charters, and the liability of successors to pay fines at entry, the system is entangled, troublesome, and expensive; and, at least as far as forms are concerned, is allowed to stand in need of reform.

FEUD (Angl.-Sax. *fœght*) seems to be only another form of the word *fight*, and is allied to *foe*, and probably to *fiend*. It meant a war waged by one family or small tribe on another, to avenge the death or other injury of one of its members. In a certain state of society, this is a legitimate mode of obtaining redress. It prevailed extensively among the nations of Northern Europe; and it was only by gradual steps that the practice was first restricted and then abolished. The laws of Rudolf I. of Germany recognised the right of waging feuds. At last, partial associations were formed, the members of which bound themselves mutually to settle their differences by courts of arbitration and compensation, without going to war.

FEU'DAL SYSTEM. By some, the word feu or feud, of which feudal is the adjective, is derived from the Lat. *fides*, faith, and *eud* or *odh*, or *od*, a Teutonic word signifying a property, or estate, in land; whilst by others, with perhaps greater probability, the first syllable also is maintained to be Teutonic, equivalent to *vieh*, cattle, ultimately from the same root with the Latin *pecus*, which, in the form of pecunia, came to signify property, and its representative, money—because, as Varro remarks, property amongst pastoral nations consisted of cattle (Varr., *De Lingua Latina*, 5, 19, s. 95, ed. Müll). A feudum, in this sense, would be a piece of land held for a *fee*, or pecuniary consideration, using pecuniary in the wide sense which its etymology suggests. Be this as it may, the feudal system, as a developed institution, belonged neither to the Teutonic nor to the Romanic nations, in their original and unmixed condition. We find it neither in the woods of Germany, nor in the Roman empire previous to the incursions of the Franks and Lombards. Neither the institutions described by Tacitus, nor those with which the Roman jurists have rendered us familiar, exhibit anything that is even analogous to it as a whole. But they each exhibit partial indications of some of the characteristics which most peculiarly distinguish it; and as it arose about the beginning of the 9th c., just when the fusion between the conquering barbarians and the subject populations of the Romanised provinces was everywhere taking place, it seems impossible to doubt that it was a result of the mutual influence of the two races. The subordination of class to class, and the intimate relations by which all the classes of the community were bound together, taken along with the independence and equality of the individual members of each class within itself, were amongst the most prominent features of the simple society of the Teutonic nations; and these correspond with wonderful accuracy to the relations of superior and vassal, beginning with the sovereign and descending to the smallest feudal proprietor, and also with the equality amongst *peers*, which existed within each of the feudal classes. On the other hand, the incomplete and fiduciary character of the proprietorship implied in a *feu*, as held in trust from a superior on the faith of services to be rendered, or dues to be paid, bore a very close analogy to the Roman emphyteusis (from which indeed the word feu has often been derived), and to the *dominium utile* as opposed to the *dominium directum*. See DOMINIUM and EMPHYTEUSIS.

The nature of this very important social institution, by which the life of every European people of any importance was governed from the beginning of the 9th till the close of the 13th c., and by which many of the forms of our modern life are still effected, will probably be more clearly understood

ommence our description of it from below, biting the position of the simple land- than by adopting the monarch in whom nated, and from whom, in a technical sense, supposed to flow (see ALLODIUM), as our f departure. The latter course has been rictly adhered to by English writers, from umstance that, subsequent to the Conquest, le territory of England was regarded as the of the conqueror, and was by him divided his barons, and by them amongst their nts, an arrangement which was somewhat to England (see ALLODIAL), whereas the ystem, in its essentials, was common to the Europe. A feudal proprietor, then, or feud- as a person who held his lands from another, own lifetime merely, in the earlier times, on n of certain services which he was to perform erior or suzerain. Apart from the duties to e was thus bound, he was not only a free t his position was that almost of an inde- sovereign within his own small dominions. lding was at all an extensive one, he lived stle, which, notwithstanding the efforts of agne and his successors to prevent it, was y fortified, not only for purposes of defence, enable him to pursue that life of rapine n lawless times was not considered incon- rith honesty or personal worth. For greater , the castle was generally situated on a and under its walls there nestled a village, l all the dependents of the proprietor, with ption of his immediate family, and all those d by the cultivation of the soil, usually dwelt d farmhouses and cottages being too much to plunder to admit of their being scattered county then, as we see them in England portion of the inhabitants of each feudal were usually bound to the soil, and were bject to a species of slavery, the conditions varied according to the customs of different . These were spoken of as *adscripti* or *itii glebæ*, and were called *nativi*, or bond- d *villein-socmen*, as opposed to free-socmen one hand, and serfs or *thowes* on the f whose position we shall speak below. 's *Com.* I. p. 188.) 'He was,' says Sir Palgrave, speaking of the ceorl, 'a villain ant; and, notwithstanding the language was employed (to the effect, namely, that ld be bequeathed, bought, and sold), it understood that the gift, the bequest, or , was in effect the disposition of the land the ceorl, and of the services which the rformed for the land, a transaction widely from the transfer of a slave, whose person bject of the purchase.' (*Rise and Progress English Commonwealth*, vol. i. p. 18.) The oreover, could purchase his own freedom of his wife and offspring (*Ib.*). See VILLEIN. t were free tenants, farmers in the modern hough personal services to the proprietor y in almost every case constituted a portion rent which was paid. Latterly, when the of subinfeudation was introduced, many of lthier tenants came to stand to the baron, of the domain, very much in the relation we are about to describe as subsisting him and his lord paramount. From enants-at-will, scarcely less subject to his y and exposed to his caprices than the or villeins of the lowest class, they became of their lord, and free citizens of what thus y developed itself into a feudal monarchy ture. The tenure by which this latter class ir lands was generally known in England as Free Socage (Stephen's *ut sup.* i. 205 *et seq.*). The castles by which the banks of the Rhine are studded along its whole course, from Bonn to Bingen, with their villages and parish churches, for the most part in the condition in which they were erected centuries ago, afford the most numerous and perfect examples of the arrangements of the feudal period which are perhaps anywhere to be met with. The possessors of these castles stood in a magisterial as well as a proprietary relation to their dependents. They exercised jurisdiction, extending even to the infliction of capital punishment, either in person or by means of officers whom they appointed for the purpose; and the castle was in general furnished with dungeons and other appliances for carrying their sentences into execution. Towards each other they stood in the relation of equals, or peers (Lat. *pares*); they were neighbours, simply, and friends or enemies as the case might be—too often the latter. But towards their immediate feudal superior, the count, marquis, duke, or whatever might be his title, to whom the government of the whole district belonged, they all stood in a relation which brought them in contact, and in some degree bound them to each other. Of him they held their lands on conditions somewhat similar to those on which they let them out to their own dependents. At first, as we have said, they were only tenants for life; but their rights in most countries very early assumed a hereditary character, the dominant proprietor's rights, on the death of a tenant, being confined to the exaction of certain dues from his son and successor, as a consideration for conferring on him, or rather for confirming to him, the feu which his father had held. Where the feu, fief or feoff, as it was sometimes called from the mode of admission —footfinent, or, as it is said in Scotland, infeftment (q. v.) – descended to a female, the dominant proprietor was entitled to control her marriage, for the purpose of procuring himself a sufficient and trustworthy vassal; a privilege which, like all those of the lord, was latterly converted into a mere pecuniary claim. When the lord paramount, or suzerain, as he was called, held his court of justice, his vassal barons were the judges, being all on a footing of equality, or *pares curiæ*, as it was called. When he made war, either on his own account, or as furnishing a contingent to the army of the state, in such cases as in the national wars between France and England in the 12th and 13th centuries which were the earliest instances of really national wars—his vassals were bound to attend him in person, and to furnish each the contribution of men, horses, arms, and other materials of war for which he was liable by the tenure on which he held his lands. In addition to these services, he was bound to watch and ward his castle, a duty which the minor barons almost invariably imposed on their vassals when the system of granting fiefs extended downwards to the class of persons who had formerly been mere tenants-at-will. Then there were certain dues which were almost always exigible from the vassal, such, e. g., as contributions towards providing a ransom for his lord when in captivity, for enabling him to celebrate the marriage of his eldest son with due pomp, or to provide a suitable dowry for his daughter. If these dues were not paid, the land reverted to the dominant proprietor, in relation to whom the vassal all along was a mere usufructuary. So far were the conditions of feudal holdings from being always the same, that no less than eighty different tenures have been enumerated; the onerous character of which varied from what was merely nominal, e. g., the payment of a white rose or a

pair of spurs, 'if asked merely,' up to what was a rent in some degree equivalent to the value of the land. For an account of the manner in which the feudal system affected the constitution of land rights and the conveyance of landed property, and still affects them, see CONVEYANCING.

Inferior to all the classes of society in feudal Europe of which we have hitherto spoken, there is reason to fear that there existed almost everywhere, in the earlier times, a class of the positively unfree. The lot of those who were in absolute slavery excluded them from the influences of feudality as a legal and social institution—'they were not reckoned,' says Palgrave, 'amongst the people'—but their existence is by no means to be left out of account, in forming to ourselves a picture of European society in feudal times. Of the condition of this class, as forming the substratum of feudal society, we shall have a pretty accurate conception from the following passage, in which Lappenberg describes them in Anglo-Saxon times, if we bear in mind, on the one hand, that subsequently to the Conquest their ranks were probably swelled by such of the Anglo-Saxon population as was in absolute poverty; and on the other, that their position, in all the countries of Europe, was gradually ameliorated by the influences of Christianity, the spirit if not the letter of which has everywhere proved hostile to slavery. 'One class of the Anglo-Saxon population, at the period of the Norman Conquest, consisted of the unfree or servile (*theowas, esnas*), whose number, as registered in Domesday-book, was little above 25,000. Of these, the majority were in a state of slavery by birth, whose forefathers had been either Roman slaves, British prisoners of war, or other enemies. Others, denominated, *wite-theowas*, or penal slaves, had been freemen, but reduced by the sentence of the law to the servile condition, on account of debt or delinquency. (Palgrave *ut sup.* i. 28.) The master had the right of selling the theow in the country, but not beyond the sea, even if he had perpetrated crime. In other respects, the condition of the servile seems to have differed little from that of the indigent free slaves who had a special wergild, half of which fell to the master and half to the kin.' (Thorpe's Lappenberg, ii. p. 320.) It is probable that the vast majority of the servile class in Anglo-Saxon, and even in Norman times, consisted of persons of Celtic blood. (Palgrave *ut sup.* p. 26.) In proof of this fact, Lappenberg remarks that their numbers diminish as we recede from the Welsh border and from Cornwall, the places in which the Celtic or original British population is known to have taken refuge.

The social elements which counteracted and mitigated the influences of feudality in mediæval life, were monarchy, the church, which vigorously promoted the emancipation of the unfree, and above all the growing wealth, power, and importance of the commons. In order to free himself from the rude and insolent dictation of his great feudal vassals, the king, in almost every European state, courted the alliance of the town communities, who had remained more in the condition in which they had been left by the Romans than the inhabitants of the country, and who were consequently all along more or less opposed to the growth and influences of feudality. See MUNICIPIUM. By their aid, even before the formation of standing armies, something approaching to executive power was placed in the hands of the sovereign. He was thus enabled to appoint and enforce the decrees of independent judges of his own, who in the earlier time were generally churchmen, and thus greatly to circumscribe the power and influence of all classes of feudal proprietors over their dependents. Though the period of bloom of the feudal system was, as we have said, from the 9th to the 13th centuries, in most of the countries of Europe, it everywhere, in many of its features, long survived the latter period. Even considered as a social, and not merely as a legal institution, in which latter capacity it still exists, it was in many respects in vigour in Scotland down to the year 1747, when military tenures were abolished by statute, as dangerous to public tranquillity.

FEU DE JOIE, or 'running-fire,' a discharge of musketry into the air, made in honour of a victory or other great occasion. It commences with the right-hand man of the line, who discharges his rifle, and is followed successively, at scarcely perceptible intervals, by the men on his left, until the extreme left of the line is reached. The effect much depends on the regularity with which the slight interval between the discharges is preserved.

FEU'ERBACH, PAUL JOHANN ANSELM, RITTER VON, one of the most distinguished criminal jurists of Germany, was born at Jena 14th November 1775. Brought up at Frankfurt-on-the-Maine, where his father was an advocate, and educated in the gymnasium there, he went in 1792 to Jena, where he cultivated his mind by the study of philosophy, and then devoted himself to positive law. In 1798 he appeared as criminal jurist in a work *On the Crime of High Treason*, and in the following year he began to deliver lectures in the university of Jena. In his lectures and published writings, he introduced into criminal jurisprudence a new method of treatment, which was systematised in his Compendium of German Penal Law (*Lehrbuch des Gemeinen, in Deutschland geltenden peinlichen Privatrechts*, Giessen, 1801; 14 Aufl. von Mittermaier, 1847). This celebrated work placed F. at the head of a new school of jurists, who maintain that the decision of the judge in every case ought to be determined solely by an express deliverance of the penal law, never by his own discretion, and who on that account obtained the name of Rigorists. In 1801 F. was appointed ordinary professor in Jena, but in 1802 accepted a call to Kiel. In 1804 he was removed to the university of Landshut; but next year, having received a commission to prepare a penal code for Bavaria, he was transferred to Munich as privy referendary for the ministerial, judicial, and police departments; and in 1808 was appointed privy-councillor. The new penal code which he planned for Bavaria (*Strafgesetzbuch für das Königreich Baiern*, München, 1813), received, after a few modifications, the royal approval, and was taken as a basis in the emendation of the criminal law of several other countries. During this period also, he published his Remarkable Cases in Criminal Law (*Merkwürdige Criminalrechtsfälle*, 2 Bde., Giessen, 1808–1811), which first led the way to a deeper psychological treatment of such cases. In 1812, he published a work on Trial by Jury, to which a second volume, on the Judicial Procedure of France, was added in 1825, as the result of a visit to Paris in 1821. In 1817 he became second president of the Court of Appeal in Bamberg, and afterwards first president of the Court of Appeal at Anspach for the Rezat district. In 1832 he published a work on the unfortunate Kaspar Hauser, whose mysterious fate had strongly attracted his interest. He had just edited a collection of his miscellaneous writings, when he died at Frankfurt-on-the-Maine 25th May 1833. An interesting life of F. has been written by his son, Ludwig (*Leben und Wirken Anselm von Feuerbachs*, 2 Bde., Leip. 1852). F. left, besides three daughters, five sons, who have all distinguished themselves in German literature.

ERBACH, Ludwig Andreas, German
ber, fourth son of the preceding, was born
ch, 28th July 1804. After studying theology
years at Heidelberg under Paulus and Daub,
he was attracted to Berlin for the purpose
ng Hegel, and soon after he abandoned
. with the view of devoting himself entirely
iophy. In 1828 he became *privatdocent* in
ersity of Erlangen, but in a few years
he academical chair, and gave up his whole
literary labour. In a small anonymous
edanken über Tod und Unsterblichkeit, Nürn-
30), which attracted little attention when it
, he indicated that he had already gone
he standpoint of his master Hegel, by com-
he doctrine of immortality. During the
years, he published three works on portions
istory of philosophy, treating severally of
d between Bacon and Spinoza, of Leibnitz
Pierre Bayle. But these historical works
ed the way to a critical investigation into
re of religion and its relation to philosophy,
lts of which have been given to the world
al works well known to speculative theolo-
The most celebrated of these is his work on
ire of Christianity (*Das Wesen des Christen-*
eip. 1841: 2 Aufl. 1843), which has been
d into English. Starting from the Hegelian
, that the Absolute comes to consciousness
humanity, F. denies to it any existence
the human consciousness, maintaining it to
ly the projection by man of his own ideal
objective world, on which he feels his
nce. All authority above man, and conse-
all moral obligation, is therefore consistently
as a delusion proceeding from man himself,
highest good is explained as that which
e whole most pleasurable. Yet even this
good is further explained as consisting in
nce to that ideal humanity which man
for himself, and worships as God. A kind
theism is therefore retained by F.; but when
rines were adopted by the mass of German
ists, they degenerated, perhaps logically,
actual atheism, which ignored any moral
l law imposed on the individual from any
urce than himself. - The works of F. have
llected, with additions and corrections to
em into accordance with his later views
mmtliche Werke, 8 Bde., Leip. 1846 - 1851),
e then he has published a work entitled
ie (1857).

ILLANS, Congregation of, a reform of
rcian order, remarkable as forming part of
t religious movement in the Roman Catholic
during the 16th c., contemporary with and
stimulated by the progress of the Refor-
The author of this reform was Jean de
ere, abbot of the Cistercian monastery of
s, who, painfully struck by the relaxation
iscipline, laid down for himself a new and
ore austere course of life, in which he soon
many imitators and associates among the
of his order. The rule thus reformed was,
nsiderable opposition from the advocates
old rule, approved, with certain modifica-
y Pope Sixtus V.; the reformed congre-
however, being still left subject to the
y of the abbot of Citeaux; and a con-
s founded for them by Henry III. in the
: Honoré, Paris. The subjection to the
f Citeaux was removed by Clement VIII.
: and Urban VII., in 1630, separated the
ation into two branches, one for France,
e other for Italy, each under a distinct
. The rules of both these branches were subsequently modified about the middle of the same century.

The celebrated revolutionary club of the Feuillants took its name from this order, the convent of which, in the Rue St Honoré, was the place of meeting for the members of the club. It was founded in 1790 by Lafayette, Sièyes, Larochefoucauld, and others holding moderate opinions. The club was at first called the 'Company of 1789,' and was intended to support the constitution against the ultra party. It reckoned among its members individuals of all classes, who took the constitution of England as their model. This opposition served, however, only to accelerate the revolutionary movement. On the 27th January 1791, on Count Clermont Tonnerre being elected president of the club, a popular insurrection broke out against it; and, on the 28th March, the assembly in the cloister was forcibly dispersed by a raging mob.

FEUILLETON (Fr.), literally a small leaf, signifies that portion of a political newspaper set apart for intelligence of a non-political character, for criticisms on art, literature, &c., and usually separated from the main sheet by a line. The feuilleton is an invention of the *Journal des Débats*, which, since the year 1800, has held an important place in the sphere of literary criticism. By degrees, the belles-lettres element began to pervade it; and the result was a species of light journalistic literature, in which Jules Janin became the acknowledged king. In the years immediately preceding the February revolution, entire romances were spun out in the feuilleton. The *Constitutionnel*, in particular, made large pecuniary profits by the social romances of Eugene Sue, which it published in this manner. The French system has been imitated in England and Germany, though with less success than in France.

FEVEDA, an island of British Columbia, is situated in the Gulf of Georgia, between Vancouver Island and the continent. It is in lat. 49° 41′ N., and long. 124° W., measuring 32 miles in length by 2 in average breadth. It possesses a snug little harbour, which appears to be all the more valuable on account of the superior quality of the fuel which abounds on the spot. Its formation is understood to be wholly of limestone.

FEVER (Lat. *febris*, from *ferveō*, I grow warm, or perhaps from *februō*, I cleanse), a form of disease characterised principally by increase of the temperature of the body, which, however, requires to be estimated according to the state of the internal parts, rather than the external; the surface of the body, and particularly of the extremities, being not unfrequently cold rather than warm. Having regard to the heat of the surface only, fever has commonly been considered as passing through three distinct stages, more or less marked: 1, the cold or shivering stage; 2, the hot stage; 3, the sweating stage. This description is perfectly correct in most cases, but it requires to be qualified by the remark, that even in the cold stage of fevers, it is now well ascertained that the blood and the internal organs have an elevated temperature, as estimated by the thermometer introduced into the cavities of the body. In the cold stage of fever, accordingly, and even in the most violent ague, when the teeth are chattering with cold, and the whole surface is pale and clammy, the state of the system is well expressed by the aphorism of Virchow (the most ingenious and comprehensive of the modern exponents of the pathology of fever), to the effect that 'the outer parts freeze while the inner burn.' Increased heat of the body, therefore, is the most essential, perhaps the only essential phenomenon of

fever. The other symptoms are loss of appetite, thirst, restlessness, and vague general uneasiness, often headache, and diffused pains in the back and limbs; a frequent pulse, which is sometimes also full and hard; a furred tongue, often with red margin; a flushed face and suffused eyes; vitiated secretions, and general derangement of the functions, with great debility of the voluntary movements of the limbs. The disease often commences with a shivering, or rigor, as it is technically called; this leads through the cold stage to the hot, which usually follows pretty rapidly, and is attended by all the febrile phenomena in their highest degree; the skin being often very pungently warm to the hand, dry, and harsh; by and by, the pores appear to open, moisture begins to bedew the surface, and the pungent heat disappears: the disease is then about to pass into its third or sweating stage, which ushers in the convalescence. For the special symptoms of particular fevers, see TYPHUS and TYPHOID FEVERS, SMALL-POX, SCARLET FEVER, MEASLES, AGUE, INTERMITTENT and REMITTENT FEVER, YELLOW FEVER.

Besides being thus the leading fact in a number of specific diseases, fever is also associated with many other forms of disease as a secondary or subordinate phenomenon, connected with an inflammation or other distinctly local disease. Thus, in Pneumonia (q. v.) or Enteritis (q. v.), fever is as much a part of the symptoms as pain or any other; and even in some chronic or long-standing diseases, as in Consumption (q. v.), a slow and consuming type of fever (see HECTIC FEVER) is found to be very generally present. Indeed, there is no condition which rules so large a part of the physician's duty, whether in the way of distinguishing diseases or of curing them, as this constitutional state. Fever is also very generally prevalent after surgical operations and injuries, of which it constitutes one of the leading dangers; and in midwifery practice, it is well known as constituting a large part of the risks of the puerperal state, whether in the slighter form commonly called *a weed*, or in the more dreaded and fatal, often epidemic, form of Puerperal Fever (q. v.).

The family of fevers is thus separated pretty naturally into two large groups, in one of which the fever is the greatly predominating fact, and determines the specific character of the disease: the local disease (if present) being quite subordinate, and usually secondary in point of time; the other, where the opposite order prevails, and the fever is obviously secondary. Hence the distinction embodied in medical language between *idiopathic* (i. e., self-originating, spontaneous) and *symptomatic* or secondary fevers. Fevers are also distinguished, with reference to their mode of diffusion, as Epidemic (q. v.) and Endemic (q. v.); or with reference to their supposed cause, as contagious, infectious, malarious, pneumonic, rheumatic, &c.; or with reference to their incidental symptoms and their peculiarities of course and termination (the presumed *specific* phenomena attracting, of course, particular attention), as eruptive (see EXANTHEMATA) or non-eruptive, bilious, gastric, enteric, mucous, putrid, malignant, typhoid, &c.

Among these distinctions, based upon the course of the fever, one demands particular notice, as involving an important law of febrile diseases generally, and of a large class of fevers of warm climates in particular. Periodic increase and diminution, or paroxysms of longer or shorter duration, with intervals of more or less perfect relief from all the symptoms, are characteristic of most diseases of this kind, but especially of those arising from *malaria*, i. e., emanations from the soil, under the influence of solar heat. The dur the paroxysms and of the intervals, the c *intermission*, or more partial *remission*, of sy become in such cases the characteristic fa mark the *type*, as it is called, of the fever is accordingly distinguished as intermittent tent, or continued; and, according to the of the periods, Tertian, Quartan, Quotidi (q. v.).

The true pathology, or ultimate essence febrile state, is still a subject open to questi it is in accordance with modern physiology t fever as connected with some complex derar of the functions on which the animal heat is to depend—viz., the nutrition of the texture vital changes constantly in operation betw blood, on the one hand, and the ultimate a solid texture, on the other. Recent obse have shewn that, in the paroxysm of ague, th of the nitrogenous tissues is in excess; and the curious result appears to be arrived at, almost every grain of excretion representi excess of waste in a given time, there is a tional increase of the temperature of the according to accurate thermometric obser If such observations are corroborated and ex it will probably appear that the cause of fe be found in an increased destructive decom of the atoms of texture through the oxygen a at the lungs and circulated with the blood; under the influence of a derangement of system; which has been shewn by experi have a very marked control over the gener animal heat.

The treatment of fever will be considered the separate forms already referred to.

FE'VERFEW (*Pyrethrum parthenium* or *caria parthenium*), a perennial plant, found i places and near hedges in Britain and many Europe. It is botanically allied to Chamomile and still more nearly to Wild Chamomile (*Ma chamomilla*), and much resembles these plant

Wild Chamomile (*Matricaria chamomilla*)
a, floret of the ray; *b*, floret of the disc; *c*, fruit, shew toothed membranous pappus.

properties, but differs in appearance, the segm its leaves being flat and comparatively broa its flowers smaller. Its habit of growth is er stem much branched, and about 1—2 feet hi has a strong, somewhat aromatic smell. It wi

nedy in ague, and from time immemorial d as an emmenagogue. It is employed and is stimulant and tonic. A double ot uncommon in gardens.—Of the same F. is the MAYWEED (*P. inodorum* or *M.* ith leaves more resembling those of out almost scentless, and large flowers, ray and yellow disc, very common in d waste places in Britain and through-

WORT (*Triosteum perfoliatum*), a per- of the natural order *Caprifoliaceæ*, having nd, hairy, fistular stem, from one to four pposite ovato-lanceolate entire leaves, rls of flowers, with tubular 5-lobed leathery 3-seeded berries. It is a native erica, where its dried and roasted berries casionally used as a substitute for coffee; iefly valued for its medicinal properties, ng as an emetic and mild cathartic. It s called *Tinkar's Root*, from Dr Tinkar, ought it into notice.

. *Fus*), the chief and most northerly the empire of Marocco, occupies the tween the Atlas Mountains and the an. Its population is estimated at 000, consisting of Berbers, Moors, Arabs, rs, and a few Europeans. The province nto fifteen districts.—FEZ, the capital of , in lat. 34° 6′ N., and long. about 5 0′ nded by Muley Edris II., in the year nd was reckoned during the middle it was the capital of the kingdom of ne of the most magnificent and largest ne Mohammedan world. It is said to ned about 90,000 dwelling-houses, and mosques, and was celebrated for its iblic buildings, schools, and scientific On the removal of the court to Marocco, middle of the 16th c., F. gradually ecay. It is still, however, a place of importance. The situation of F. is lies in a valley, formed by surround- to a sort of funnel, the higher parts of overed with trees, orange groves, and It is divided into Old and New F. by upper branches of the Sebu, and has variously estimated at from 20,000 to 0 souls. There are 100 mosques, of most important is that built by the y Edris, which contains his monument, nviolable refuge for criminals, however account of its numerous mosques and egarded as the Holy City of the western has seven well-attended schools. The f the sultan is large, but is now falling In other respects, the external aspect its numerous baths, caravanseras (of are about 200), and bazaars, resembles hammedan towns in general; the mul- tels and shops alone imparting to it a more European character. A consider- still carried on, by means of caravans, djoining countries on the south and ling as far as Timbuktu. F. carries ctures of woollens, sashes, silk-stuffs, pers, fine carpets, &c. Its artisans are workers in gold and jewellery.

(more correctly, FESSAN), an extensive north of Africa, in 24° - 31 N. lat., ° E. long. It lies south of the regency nd has a population variously estimated 000 to 150,000, souls. The north is for part hills, but the hills are composed barr, black quartz sandstone, with no rivers or brooks among them, and the south is mainly a level waste of dry sand. Not more than a tenth of the soil is cultivable. In the neighbourhood of the villages, which are situated mainly in the wadies, wheat, barley, &c., are cultivated. Camels and horses are reared in considerable numbers. Lions, leopards, hyænas, jackals, wild-cats, porcupines, vultures, ostriches, buzzards, &c., are found in abundance. The inhabitants are a mixed race, of a brown colour, in many respects resembling the negroes, but are generally well formed. The original inhabitants belonged to the *Berber* family, but since the invasion of the country by the Arabs in the 15th c., the traces of this native North African element have gradually become very faint. The language spoken is a corrupt mixture of Berber and Arabic. The people are far behind in civilisation, and occupy themselves with gardening and the manufacture of the most indispensable necessaries of life. Considerable trade is carried on by means of caravans between the interior of Africa and the coast. F. is the Phazania of the ancients, against which the Romans, under Cornelius Balbus, undertook a campaign about 20 B.C. During the classic period, as well as in the middle ages, it was governed by its own princes who were at first independent, but afterwards became tributary to the pashas of Tripoli. In the year 1842, F. was conquered by the Turks, and since that time has remained a Turkish pashalic. Murzuk, the capital of F., is a well-built town, with broad streets and a population of 2800. Merchandise to the value of £21,000 annually changes hands here, and of that amount the slave-trade forms seven-eighths. Murzuk is now the great starting-point from the north for the interior of Negroland. Compare Barth's *Travels in Central Africa* (Lond. 1857), and also the descriptions given of Fezzân by Denham, Clapperton, Oudney, Richardson, Dr Vogel, &c.

FIAR. See FEE AND LIFERENT.

FIARS (a word said by Jamieson to be of Gothic origin, and to exist in the same form in Icelandic). The *fiars* prices in Scotland are the prices of the different kinds of grain of the growth of each county for the preceding crop, as fixed by the sentence of the sheriff, proceeding on the report of a jury summoned for the purpose, before whom the evidence of farmers and corn-dealers is produced. The values thus officially ascertained serve as a rule for ascertaining the prices of grain in all contracts where they are not fixed by the parties; and in many sales it is agreed to accept the rates fixed by the fiars. Ministers' stipends, in so far as they consist of grain, and crown dues, are also paid by the fiars prices of the county for each year. With a view to the latter, fiars, in former times, were struck in exchequer. An error in striking the fiars will not afford a ground of suspension.

The form of procedure in 'striking the fiars,' as it is called, is regulated by Act of Sederunt, 21st Dec. 1723, renewed 29th February 1728. The time fixed by this act for summoning the jury is between the 4th and 20th of February, and the verdict must be returned before 1st March, old style; which is generally considered too early, as before that time not much grain of the previous crop has been brought into the market. Mr Barclay, sheriff-substitute of Perthshire, in his Digest, gives the following account of this difficult and delicate process as practised in his county. 'In Perthshire, the fiars court is held on the last Friday of February, or the first Friday of March. The jury consists of eight heritors, a few farmers, and some neutral parties, especially one or two able to check the calculations.

An experienced accountant is sworn, and acts as such, but is not on the jury, and is paid a fee from the county rates. The list of the jury is shifted every alternate year, thereby giving sufficient release from duty, and yet securing persons skilled in the practice. Some years ago, it was arranged to take no juror who either paid or received rents according to the fiars; but this greatly limited the choice, and was complained of, and abandoned. All considerable dealers in Perthshire victual, whether resident in Perthshire or elsewhere, are uniformly summoned, and in addition, every person whose name is given in by whatever person interested.' As grain is commonly sold according to weight, one shilling being generally allowed on wheat for every additional pound-weight on every bushel; on an application by the farmers, it was agreed to determine the classification by taking a certain weight as the point of division. The first thing which the jury do is consequently to determine the point of weight. The witnesses are then sworn to the schedules, which they receive after harvest, and in which they insert every separate quantity of grain sold, with the dates and prices divided into first and second classes, according as the judgment of each witness dictates, and the weight of each parcel. The results of the separate schedules are inserted by the accountant in a general schedule, which is summed up by the accountant, such members of the jury as are capable assisting him. The result constitutes the fiars prices for the year. The same mode is not adopted in England; but weekly averages of *all* grain sold at public markets are ascertained and published in the *Gazette*, and this is without respect to the produce of particular counties. 9 Geo. IV. c. 60; 5 and 6 Vict. c. 14; 9 and 10 Vict. c. 22. See *Historical Account of the Striking of the Fiars in Scotland*, by George Paterson, Esq., Advocate, 1852.

FIA'SCO, a term borrowed from the Italian theatre, and now naturalised in France and Germany, besides being occasionally used by English writers. It signifies a failure to please on the part of an actor or singer, and is thus the opposite of *furore*, although why the word, which simply means a bottle, should come to be thus applied, is more than anybody knows. In Italy, it is not uncommon to hear an audience cry out, '*Olà, olà, fiasco*,' even when the singer has only made a single false note.

FIAT, in English Law, a short order or warrant of some judge for making out or allowing certain processes.

FIBER. See MUSQUASH.

FIBRE (Lat. *fibra*), a term of very common use as applied to objects of a stringy or thread-like character, whether of the animal, vegetable, or mineral kingdom. Minerals are often described as of a fibrous structure or appearance, in which there is, however, no possibility of detaching the apparent fibres from the general mass, or in which they are inflexible and brittle if detached: but a more perfect example of mineral fibre is found in *Amianthus*, a variety of ASBESTUS (q. v.). For the scientific use of fibre with regard to the animal kingdom, we refer to the article MUSCLE; for its scientific use with regard to the vegetable kingdom, to VEGETABLE TISSUE and to WOOD AND WOODY FIBRE. In its more popular, but perfectly accurate use, it includes the hair or wool of quadrupeds, the silken threads of the cocoons of silk-worms and other insects, the fibres of the leaves and of the inner bark of plants, and the elongated cells or hairs connected with the seeds of plants, the ordinary materials of cordage and of textile fabrics.

Of mineral substances, amianthus alone has been used for textile fabrics, and that only to a very limited extent. Animal and vegetable fibres have, from the earliest ages, supplied man with cordage and with cloth. How the invention took place, can only be matter of conjecture.

The animal fibres used for textile purposes are chiefly of the two classes already mentioned—(1) the wool or hair of quadrupeds, and (2) the silk of the cocoons of insects. To these may be added (3) the Byssus (q. v.) of molluscs, but this class contains only the Byssus of the PINNA (q. v.) of the Mediterranean, an article of ancient and high reputation, but more of curiosity than of use. The skins and intestines of animals, although sometimes twisted or plaited for various uses, can scarcely be reckoned among the fibrous materials afforded by the animal kingdom. For information regarding the fibres obtained from the cocoons of insects, see SILK and SILKWORM. It is to the first class that the greater number of different kinds of animal fibre used for textile purposes belong; and the wool of the sheep far exceeds all the rest in importance. See SHEEP and WOOL. But the wool or hair of other quadrupeds is also to some extent used, as of the Goat (see GOAT and ANGORA), the Alpaca (q. v.), the Camel (q. v.), the Bison (q. v.), the Musk Ox (q. v.), the Yak (q. v.), and the Chinchilla (q. v.); all of which, except the last - and it has but a doubtful claim to be mentioned—are, like the sheep, ruminants. The hair of comparatively few animals is sufficiently long for textile purposes, or can be procured in sufficient abundance to make it of economic importance. The warmth of clothing depends much on the fineness of the hair, and on other characters in which wool particularly excels.

The useful vegetable fibres are far more numerous and various than the animal. They are obtained from plants of natural orders very different from each other; none of them, however, belonging to the class of acrogenous or cryptogamous plants. They are obtained also from different parts of plants. Those which are derived from exogenous plants are either the fibres of the inner bark (or BAST, q. v.), as flax, hemp, &c., or hairs of the fruit, as cotton. The useful fibres of endogenous plants sometimes also belong to the fruit, as coir or cocoa-nut fibre, and the unimportant fibre of cotton-grass. The spathe of some of the palms is sometimes also sufficiently fibrous and strong to be used for bags, &c., without separation of its fibres; the fibres of the interior of the stem of old cocoa-nut palms are sometimes used for coarse purposes; the fibrous character of the stems of the slender palms called rattans, of bulrushes, &c., fits them for wicker-work, for plaiting into chair-bottoms, and the like; the roots of the *Agaves* (q. v.) yield fibres useful for various purposes; but generally, the more valuable fibres obtained from endogenous plants are those of their leaves, either of the leaf-stalks—as Piassaba fibre and Gomuto or Ejoo fibre, both produced by palms—or of the blade of the leaf, as Pine-apple fibre, Pita Flax, New Zealand Flax, Bowstring Hemp, &c. The fibres of the leaves of endogens being parallel to each other, are easily obtained of sufficient length for economical purposes; whilst the reticulated fibres of the leaves of exogens, even if long enough, which is comparatively seldom the case, cannot be separated for use. The *bast* fibres of exogens, however, are often of sufficient length, and easily separable. Their separation is generally accomplished by steeping in water, or by frequent bedewing with water, so as to cause a partial rotting of the other parts of the bast and of the bark which covers it. But the fibres of endogens being in

ral discoloured and injured by this process to uch greater degree than those of exogens, mere anical means are usually preferred for their ation, such as beating, passing between rollers, scraping. The fibres of many leaves are separ- by scraping alone. The fibres of *fruits*, as n, exist in nature in a separate state, like the or hair of animals, and require merely to be ted and cleaned.

complete enumeration of the kinds of vegetable applied to economical purposes would not be Flax, Hemp, and Cotton have long had the minence. To these have recently been added Zealand Flax, Jute, Sunn or Sunn Hemp, Pita Flax, Abaca or Manilla Hemp, Bow- Hemp, China Grass, Piassaba, and many s. New kinds are continually being brought notice, and to this industrial exhibitions and trial museums have most beneficially contri- l. New kinds, however, do not immediately and the attention they deserve. 'If a new ict is sent into the market,' says Dr Royle, of the regular customers will buy it, as they that to which their machinery and manufac- are suited.' But for the judgment and enter- of Mr Salt, it might have been long ere alpaca had obtained its present place among the rials of our manufactures; and there is much n to think that many vegetable fibres, now regarded, may yet in like manner be exalted portance.

r the use of vegetable fibres in the manufacture per, see PAPER.

ROUS PLANTS. Without attempting a com- enumeration of plants which yield fibres yed for economical purposes, we give the ring as a list which may be useful. Many of subjects will be found treated in separate es, or more fully noticed under the natural s. The most important are indicated by als.

I. EXOGENOUS PLANTS.

1. *Fibres of the Fruit.*

Ord. *Malvaceæ*. COTTON, produced by species of *Gossypium*.
— *Sterculiaceæ*. Silk-cotton, or vegetable silk, the produce of *Bombax villosum*, &c.
— *Asclepiadaceæ*. The silk-like down of the seeds of Virginian Silk (*Asclepias Syriaca*).

2. *Fibres of the Inner Bark or Bast.*

Ord. *Malvaceæ*. Deckanee Hemp (*Hibiscus cannabinus*).—Other species of *Hibiscus*, *Althæa cannabina*, *Sida abutilon*, &c.
— *Sterculiaceæ*. A number of species of different genera; some of them cultivated to a small extent.
— *Tiliaceæ*. JUTE (*Corchorus olitorius*, *C. capsularis*, &c.)—The bast of some trees of this family, as the Linden or Lime (*Tilia Europæa*, &c.) is used for mats, ropes, &c. See BAST.
— *Linaceæ*. FLAX, the produce of *Linum usitatissimum*.
— *Leguminosæ*.—SUNN, Jubbulpore Hemp, &c., the produce of species of *Crotalaria*.
Spanish Broom (*Spartium junceum*).
Bokhara Clover (*Melilotus arborea*).
Dhunchee (*Sesbania aculeata*).
Species of *Cytisus* (as Common Broom), Butea, *Parkinsonia*, *Bauhinia*, &c.
— *Asclepiadaceæ*. Jetee (*Marsdenia tenacissima*).
Yercum or Mudar (species of *Calotropis*).
Virginian Silk (*Asclepias Syriaca*, *A. debilis*).
Other species of several genera.
— *Apocynaceæ*. Canadian Hemp (*Apocynum cannabinum*).
Nat. Ord. *Urticeæ*. Common Nettle (*Urtica dioica*) and other species of *Urtica*.
Species of *Bahmeria*, one of them yielding CHINA GRASS Fibre.
——— *Cannabinaceæ*. HEMP (*Cannabis sativa*).
Hop (*Humulus lupulus*).
——— *Moraceæ*. The bark of some species of Fig.
——— *Coniferæ*. Inner bark and roots of some species of Pine and Fir.
——— Unknown. Buaze.

II. ENDOGENOUS PLANTS.

Nat. Ord. *Liliaceæ*.
NEW ZEALAND FLAX, fibre of leaves of *Phormium tenax*.
Bowstring Hemp, fibre of leaves of species of *Sanseviera*.
Fibre of leaves of species of *Aloë* and of *Yucca*.
——— *Amaryllideæ*. Pita Flax, fibre of leaves of *Agave Americana*.
Fibre of leaves of species of Fourcroya.
——— *Musaceæ*. Abaca or Manilla Hemp, and Plantain Fibre, obtained from leaves of species of *Musa*.
——— *Bromeliaceæ*. Pine-apple Fibre, Curratow, &c., fibres of leaves of species of *Bromelia*, &c.
——— *Pandanaceæ*. Fibres of leaves of Screw-pines.
——— *Palmaceæ*. COIR or cocoa-nut fibre, from husk of cocoa-nut. Fibre of cocoa-nut stem. Gomuto or Ejoo fibre, from leaf-stalks of Gomuto Palm (*Arenga saccharifera*).
Piassaba, from *Attalea funifera* and *Leopoldinia Piassaba* (the Chiquichiqui Palm).
Other fibres from leaf-stalks, &c., of many palms.
——— *Cyperaceæ*. Fibre from leaves of *Eriophorum cannabinum* (see COTTON-GRASS). Mats, chair-bottoms, &c., made of different *Cyperaceæ*.
——— *Gramineæ* or Grasses. Esparto (*Stipa tenacissima*).
Moonja (*Saccharum munja*).

FIBRINE is an organic compound, occurring both in animals and plants. In its chemical composition it closely resembles albumen and caseine, and it was until recently believed that these three substances possessed a common radical, to which the name *proteine* (from *proteuo*, I am first) was given, the proteine being regarded as the primary basis of all the tissues of the body. Hence we frequently find fibrine described as one of the proteine bodies.

Fibrine is mainly distinguished from the allied substances, albumen and caseine, by its separation in a solid state, in the form of extremely delicate filaments or lamellæ, from any fluid in which it is dissolved, very shortly after the abstraction of the latter from the organism.

Animal fibrine, which is of the greatest physiological importance, occurs principally in the blood, the lymph, and the chyle. In order to obtain it in a state of purity, we beat or stir the blood with a bundle of twigs, to which the fibrine adheres in strings. The impure fibrine thus obtained is then rinsed with water, boiled with alcohol and ether, to remove fatty matters—and dried. In healthy venous blood, it scarcely ever amounts to 3 in 1000 parts, its average quantity being 2·3. Small, however, as its amount is, it varies more than any other constituent of the blood, and in acute inflammatory diseases sometimes exceeds its average by five or six times. Moreover, arterial blood contains more fibrine than venous blood. In the lymph and chyle, it occurs in considerably less quantity than in the blood. In inflammatory exudations, we find fibrine in the contents of the serous cavities—as, for

example, of the pleura and peritoneum—and on the mucous membrane (as in croup); in these cases, it usually occurs in a state of spontaneous coagulation.

There are good physiological reasons for believing that fibrine is formed from albumen, and not directly from the food; and as fibrine contains a little more oxygen than albumen, it has been inferred that it is formed from the latter by a process of oxidation. As, however, more fibrine is found in the blood in pneumonia—when a considerable portion of the lungs is rendered impervious to air—than in almost any other disease, we are inclined to adopt the opposite hypothesis, that the augmentation of the fibrine in inflammatory blood is caused by an insufficient supply of oxygen. When oxygen is abundantly introduced into the blood, the fibrine rapidly undergoes further transformations: on the other hand, when, in consequence of impeded respiration, the quantity of oxygen conveyed to the blood is not sufficient to effect the further normal oxidation or transformation of the fibrine, we have an accumulation of that constituent in the circulating fluid.

It has, however, been a disputed question, whether fibrine is produced in the elaboration or in the disintegration of the tissues. For the discussion of this subject, and of other points connected with fibrine, we must refer to Lehmann's *Physiological Chemistry*, vol. i. pp. 361—364.

The substance forming the mass of flesh or muscular tissue was formerly regarded as identical with coagulated blood-fibrine. The two substances are, however, chemically distinct, and the muscle-fibrine will be described under its new chemical name, SYNTONINE (from *sunteinein*, to contract or render tense).

FIBROUS TISSUE. See TISSUES.

FI'CHTÉ, JOHANN GOTTLIEB, an illustrious German philosopher, was born at Rammeau, in Upper Lusatia, 19th May 1762. His earliest years were marked by a love of solitary musing and meditation. When a mere child, he was wont to wander forth to upland fields, that he might enjoy the pleasure of gazing into the illimitable distance. In 1775, he was placed at the gymnasium of Pforta, near Raumburg; and in 1780 he entered the university of Jena, where he devoted himself at first to theology, but afterwards to philosophy. During the years 1784—1788, he supported himself in a precarious way as tutor in various Saxon families. Subsequently, he went to Zurich in a similar capacity, where he made the acquaintance of the excellent lady who afterwards became his wife, Johanna Maria Rahn. In 1791, F. obtained a tutorship at Warsaw, in the house of a Polish nobleman. The situation, however, proved disagreeable, and was thrown up by the fastidious philosopher, who next proceeded to Königsberg, where he had an interview with Kant, of whom he had become an ardent disciple. Here he wrote, in 1792, his *Kritik aller Offenbarung* (Critique of all Revelation), which he shewed to that philosopher, who praised it highly, but still maintained a certain air of reserve towards the enthusiastically earnest author, which pained the latter greatly. At Königsberg, F. was reduced to such straits for want of the means of subsistence, that he was forced to ask the loan of a small sum of money from Kant, which the latter was stoical enough to refuse. Things were now at the worst with F., and of course—according to the old adage—they began to mend. He entered the delightful family of the Count of Krokow, near Danzig, as tutor; was enabled to marry; and in 1794 was appointed to the chair of Philosophy at Jena, where he commenced to expound with extraordinary zeal his system of transcendental idealism. F., in fact, *preached* his philosophy as if he believed its reception essential to the salvation of his hearers. In 1795, he published his *Wissenschaftslehre* (Doctrine of Science), in which he clearly broke away from Kant, whose speculations did not seem to him sufficiently thorough, or, as Englishmen would say, *idealistic*. Indeed, as early as 1793, writing to Niethammer, he says: 'My conviction is, that Kant has only *indicated* the truth, but neither unfolded nor proved it.' An accusation of atheism, which F. fervidly but fruitlessly refuted, cost him his chair in 1799. In the previous year, he published his *System der Sittenlehre* (System of Ethics, Jena, 1798), considered by many to be his most mature work. He now removed to Berlin, where he delivered lectures on philosophy to a select auditory. In 1800, appeared his *Ueber die Bestimmungen des Menschen* (On the Destiny of Man). In 1805, he obtained the chair of Philosophy at Erlangen, with the privilege of residing at Berlin in the winter. Here he delivered his celebrated lectures, *Ueber das Wesen des Gelehrten* (On the Nature of the Scholar, Berlin, 1805—1806). In the same year, appeared his *Grundzüge des gegenwärtigen Zeitalters* (Characteristics of the Present Age); and in 1806, his *Anweisung zum seligen Leben oder die Religionslehre* (The Way to the Blessed Life, or the Doctrine of Religion). But F. was a patriot as well as a philosopher. The victories of Napoleon at Auerstadt and Jena drew forth the famous *Reden an die Deutschen* (Addresses to the Germans). These addresses were full of the most exalted enthusiasm. F. 'laments that his age has denied him the privilege accorded to Æschylus and Cervantes, to make good his words by manly deeds.' The Prussian king appreciated the zeal of the eloquent metaphysician, and, on the restoration of peace, requested him to draw up a new constitution for the Berlin University. In 1810, the university was opened, with a host of brilliant names, F., Wolff, Müller, Humboldt, De Wette, Schleiermacher, Neander, Klaproth, and Savigny. By the votes of his colleagues, F. was unanimously elected rector. Here, as at Jena, he laboured with unremitting energy for the suppression of all those customs which he deemed barbarous in themselves, and incompatible with the true idea of a scholar. In 1813, the war of independence broke out, and the hospitals of the Prussian capital were soon crowded with patients. F.'s wife was one of the first who offered her services as a nurse. For five months, she tended the sick with all the patient tenderness and devotion of her nature. At last, she was seized with fever, 3d January 1814. After a fearful struggle, she recovered; but her husband caught the infection, and in spite of all remedies, sank under its influence, and died 27th January 1814. It is difficult to speak calmly of Fichte. His life stirs one like a trumpet. He combines the penetration of a philosopher with the fire of a prophet, and the thunder of an orator; and over all his life lies the beauty of a stainless purity. See *Fichte's Leben und literarischer Briefwechsel* (published by I. H. Fichte, 2 vols. Sulzb. 1830—1831); and W. Smith's *Memoir*, published by Chapman and Hall (Lond. 1848). The fundamental notion of the idealism set forth in F.'s writings, at least in the earlier of them, is the sole reality of the *Ego* or I, which posits both itself and the *Non-ego*, or Not-I. (The phrase 'to posit,' it ought to be observed here, signifies in German metaphysics, to present to the consciousness. Hence, when it is said that the *ego* posits itself, the meaning is, that the ego becomes a fact of consciousness, which it can only become through the antithesis of the *non-ego*.

is ego, however, must not be understood, to the usual misapprehension, the human e, but the 'absolute subject-objectivity' *subject-objectivität*), the eternal, universal The ego is the absolutely productive, owever, would not attain to conscious- itself—i.e., of its infinite spontaneous did it not at the same time place in to itself, and as an impediment (*anstoss*) t to its activity, the non-ego—i. e., the world, or nature. The ego, in so far determined by the non-ego, is the intelli- , and, as such, the subject of theoretical the ego, on the other hand, as deter- he non-ego, is the subject of practical Freedom, absolute, spontaneous activity, an sake, is not with F., as with Kant, the and pre-supposition of moral action, but the highest expression of the problem of l law. To realise this self-activity, how- ego requires an external world of objects, that in them as limits it may become con- its own activity. To this idealistic system it has been plausibly—some think un- ly—objected that it makes the non-ego be as the condition of morality, and at the e represents the removal of this condition im of moral effort. With respect to the ight, F.'s theory of freedom, in its funda- rinciples, attached itself to the Kantian freedom as the innate and primitive prin- ight. Generally speaking, F. makes that om the stand-point of ordinary conscious- call the world, merely a product of the ego; nly through the ego, for the ego, and in the himself afterwards modified or extended n, so as to bring out more prominently the haracter of his metaphysics. The tran- this later stage of F.'s philosophy is his *Bestimmung des Menschen* (Destination

It arose from the intense religiosity of e. F. was essentially a worshipping nature, gh he never ceased to be a philosopher, the aspiration of his later years was to realise n way the belief of the great Jewish law- The eternal God is thy refuge, and round the everlasting arms.' A popular exposi- s philosophy is given in his *Anweisung zum eben*. It is set forth in a strictly scientific n the lectures published in the *Nachgelas- erke*, edited by I. G. Fichte (3 vols. Bonn, 35), in which his *Speculat've Logik* and his heory of right and morals are particularly of attention. Although F. never, strictly , formed a school, and though his system been adopted by a few, such as J. B. Mehmel, Cramer, Schmidt, and Michaelis, ence upon the subsequent development of philosophy has been very important. F.'s works have likewise been published by I. H. Fichte. His popular works have nslated into English by W. Smith, and l by J. Chapman of London in his 'Catholic Their titles are—*The Destination of Man*, *ation of the Scholar*, *The Nature of the The Way to the Blessed Life*, and *The istics of the Present Age*.

ITE, Immanuel Hermann, son of the nd professor of philosophy in the univer- Tübingen, was born in 1797, and early himself to philosophical studies, being l by the later views of his father, which lers were essentially *theistic*. He also the lectures of Hegel, but felt averse to theistic tendencies, and leaned more to acher and Schelling. Occupied at first as a teacher, F. was appointed professor of philosophy in Bonn in 1836, and in 1842 received a call to the university of Tübingen. His chief works are—*Beiträge zur Characteristik der neuern Philosophie* (1841), *Grundzüge zum Systeme der Philosophie* (Heidel. 1839—1847); *System der Ethik* (Leip. 1850—1851), and *Anthropologie, oder die Lehre von der Menschlichen Seele* (Leip. 1856). He suggested meetings of philosophers similar to those held by physicists; and at the one held at Gotha, 1847, he delivered an address *On the Philosophy of the Future* (Stuttg. 1847). The great aim of his speculations has been to find a philosophic basis for the personality of God, and for his theory on this subject he has proposed the term *Concrete Theism*, to distinguish it alike from the abstract theism which makes God almost an unreality—a barren aggregate of lifeless attributes; and on the other hand, from the all-absorbing pantheism of Hegel, which swallows up the human and the divine in its own inapprehensible totality. Recently, F. has published an important work, *Zur Seelenfrage, eine Philosophische Confession*, which has been translated into English by J. D. Morell, under the title of *Contributions to Mental Philosophy* (1860), for an account of which see art. Consciousness. During the movements of 1848, he issued several political tracts. The principle of F.'s politics is not unlike Dr Arnold's maxim. He holds that there is only one kind of real conservatism, that of constant well-planned reform; and that all revolution consists either in attempts to precipitate prematurely the future, or to go back to ideas that are effete, the last being only the chrysalis form of the first. The state, 'according to the idea of benevolence,' belongs to the future. The regeneration of Christianity would consist in its becoming the vital and organising power in the state, instead of being occupied solely, as heretofore, with the salvation of individuals. To this recent school of philosophy belong Weisse, Chalybæus, Wirth, and others.

FICINO, Marsilio, an illustrious philosopher of the Italian Platonic school, was born at Florence 1433. He was the son of the principal physician of Cosmo de' Medici; and to the liberality of this prince he owed the classical culture which inspired his future career. At the suggestion of Cosmo, F. undertook the translation of Plotinus, Jamblichus, Proclus, and Porphyry, besides a Latin but by no means literal version of Plato. In 1463, he was appointed by Cosmo president of a classical society or academy, founded in 1440, having for its aim the diffusion of the Platonic doctrines, which F. held to be the basis and confirmation of the Christian system. On the death of Cosmo, F. found a no less munificent patron in this prince's grandson, Lorenzo de' Medici; and having, at the mature age of 40, decided on entering the church, he was endowed by Lorenzo with the rectorship of two churches in Florence, and a canonry in the cathedral. His theological doctrine, while undoubtedly sincere, presents a strange medley of incongruous views, the natural result of his attempt to fuse the philosophy of Plato with the Christian creed. He died in 1499, and was interred in the cathedral of Florence, where a monument commemorates his upright and manly qualities no less than his learning and philosophy. F.'s collected works were published at Basel (2 vols. f. 1491), and consist of translations from the Greek philosophers, and original metaphysical and theological compositions, of which we may mention the *Theologica Platonica*, *De Religione Christiana*, his Latin epistles, and a Commentary on the Epistles of St Paul.

FICTION. See NOVELS and ROMANCES.

FICTION OF LAW has been defined to be 'a supposition of law that a thing is true, which is either certainly not true, or at least is as probably false as true.'—Erskine, *Inst.* iv. 2, 38. Fictions have existed in all legal systems. They must be regarded as a species of legal fraud, which has been tolerated as enabling individuals who, by the strict letter of the law, would have been excluded from obtaining redress of evils, to procure that remedy by a pious fraud. There are two general maxims which regulate the application of fictions—viz., that no fiction shall be allowed to operate a wrong, and that no fiction shall be admitted which in the nature of things is impossible. The Roman form of judicial procedure abounded with fictions, by which alone, in many cases, a party aggrieved could enforce his right. Thus, an heir, unjustly disinherited, by the *querela inofficiosi testamenti*, feigned that his father had been mad. A stranger in Rome, who had been robbed, could not obtain restitution without the *fictio civitatis*, whereby he feigned himself a citizen. Many of the fictions existing in Rome have found a counterpart in modern systems; thus, the *fictio longæ manus*, whereby lands at a distance were feigned to be delivered, resembles an English feoffment at law. In like manner, the *fictio traditionis symbolicæ* of keys of a warehouse to give possession of the articles contained therein, and of a deed in confirmation of the covenants contained therein. The *fictio unitatis personarum* was the original of the Scottish fiction, that the heir is *eadem persona cum defuncto*. But in no system of laws have fictions been so liberally adopted as in that of England. It is by means of fictions alone that the original limited jurisdiction of the courts of Queen's Bench and Exchequer has been extended to ordinary suits. In the latter court, every plaintiff assumed that he was a debtor to the crown, and was debarred from discharging his obligation by the failure of the defendant to satisfy his demand; in the former, it was assumed that the defendant had been arrested for some supposed trespass which he had never in fact committed. The fictitious characters of John Doe and Richard Roe long contributed to make the action of ejectment famous. And though these fictions have disappeared before the ruthless hand of modern legislation, yet to this day, in an action at the instance of a father for the seduction of his daughter, damages can only be awarded on the assumption that she was his servant, and that he has suffered pecuniary loss by deprivation of her services. In Chancery, again, the whole doctrine of uses and trusts is based upon a fiction. Perhaps the best explanation of the introduction of fictions into legal systems is to be found in Dr Colquhoun's *Summary of the Roman Civil Law*, 2027. It involves, he says, 'less difficulty to adhere to known and admitted forms, and gradually to accommodate them to the changed state of society, than to upset all the incidents connected with them by a sudden change, which must ever tend to unsettle the law and practice of the courts. All nations have therefore found it more desirable to let the one glide into the other, than to adopt any abrupt measure which might disturb the practice and effect of former decisions.'

In the law of Scotland, fictions of law are not of frequent occurrence. For the benefit of creditors, the principle that the heir is *eadem persona cum defuncto* is admitted; and in an action of 'Reduction-improbation' of a deed, it is assumed that the document was false, whether the fact be so or not. But in general the legal system of Scotland has shewn a facility of adapting itself to the circumstances of the case, and that without producing the alarming results which presented themselves imagination of Dr Colquhoun.

Field-works will be more particularly nder the article FORTIFICATION (q.v.).

ARE (*Turdus pilaris*), a species of v.), in size about equal to the blackbird, eater length of wing; the general colour eathers tipped with a brownish black spot; the throat and breast reddish yellow, streaked and spotted with black; the fore part of the back and wings of a rich brown colour: the tail slightly forked and nearly black; the under parts white. The F. is a very common winter visitant of Britain, although it rarely breeds even in

Fieldfare (*Turdus pilaris*).

the northern parts of the island. It arrives from more northern regions when the winter has fully come, and departs again towards the end of spring. It is well known to youthful sportsmen, and affords much employment for their guns during the Christmas holidays, when it may generally be found in small flocks—often along with its smaller congener, the redwing—in fields, if the weather is mild, feeding on worms, snails, &c., or, in severe weather, about hedges, thickets, and woods, wherever haws and other such fruits or seeds are abundant. Its winter migrations extend southward as far at least as the islands of the Mediterranean. It is one of the summer songsters of the north of Europe and of Siberia; its song is soft and melodious, but is much less familiar to us in Britain than its call-note, which is harsh. It is extremely plentiful in Norway, where its nests are very generally built in spruce firs, and, contrary to the ordinary habits of thrushes, in society; numerous nests being often to be found in the same tree, and 'two hundred nests or more being frequently seen within a very small space.' The F. is easily tamed, and sings well in captivity.

FIELDING, HENRY, born April 22, 1707, was the son of General Edmund Fielding, connected with the Earls of Denbigh. He was sent to Eton, and was afterwards transferred to the university of Leyden, to prosecute legal studies. Returning to London, he began to write for the stage, and worked with so much industry that between 1727 and 1736 he produced nearly a score of comedies and farces, which were forgotten with nearly as much speed as they were produced. He married in 1736, and falling heir to a small estate, he, with his young wife, retired from London. But his was not a Fortunatus's purse, and his hand was continually in it; and in three years after his marriage, he was back in London a student at the Temple. He was called to the bar at the usual time, but gout intervening, steady practice was rendered impossible. Happily, a way of escape was at hand. Richardson published *Pamela*; the town was ringing with it; and F., whose strong, healthy, unconventional nature revolted from the moral priggishness of 'Virtue Rewarded,' resolved to write a counterpart, purporting to be the adventures of Pamela's brother, *Joseph Andrews*. This work, begun in a satirical mood, and intended merely to quiz Richardson, deepened as it proceeded, and flowered out into humorous adventure. The exquisite character of

Parson Adams took the world by surprise, and remains one of the permanent glories of English fiction. The next important work undertaken by him was *Jonathan Wild*, a master-piece of irony, which has never been sufficiently appreciated, and which doubtless suggested to Mr Thackeray the scope and conduct of *Barry Lyndon*. The rebellion of 1745 induced F. to undertake the direction of the *Jacobite Journal*, in support of the Hanoverian succession; and shortly after, as a reward for his loyalty, he was, through the influence of Lord Lyttelton, promoted to a pension, and to the place of justice of the peace of Middlesex and Westminster. While engaged in magisterial duties, he produced *Tom Jones*, his most famous fiction, which the world has never ceased to read, nor critics to admire. His next work was *Amelia*—less striking and masterly than its predecessor, but quieter in style, and enriched with scenes of domestic tenderness. Shortly after its publication, he was attacked by dropsy, jaundice, and asthma, a complication of disorders which baffled the skill of the physicians. Seeking relief, he left England for Lisbon on the 26th June 1754, and died there on the 8th October of the same year, at the early age of forty-seven.

F. was the first great English novelist, and he remains to this day one of the greatest. *Tom Jones* is a miracle of invention, character, and wit. It contains the most amusing scenes and adventures, the most sparkling delineations of life, high and low, the most abundant satire. Everywhere, the author's manliness, shrewd sense, and scorn of meanness and hypocrisy, are apparent. If defects may be hinted, it may be said that F.'s nature was more robust than delicate; that it was deficient in the sentimental and poetic side; and, as a consequence, that his ideal of woman is not high, and his descriptions of the tender passion either commonplace or extravagantly rapturous. The love-scenes between Tom and Sophia, and the episode of the 'Man of the Hill,' which is meant to be passionate and poetic, are perhaps the only portions of the great novel which readers skip. It is to be regretted that all F.'s works are disfigured by coarseness of circumstance and expression; but that was the fault of the time as much as of the man. He was coarse, as he wore ruffles, drank claret, and hated the Pretender. He set himself to paint society as he saw it, and we must forgive the coarseness for the truthfulness of the picture.

FIELDING, Copley Vandyke, an English painter in water-colours, was born about 1787, and began to exhibit in 1810. For many years he held the office of President of the Society of Painters in Water-colours, and was generally recognised as the representative of that branch of art in England. He died at Worthing, in Sussex, March 3, 1855, in his 68th year, and after a career of steady prosperity. Possessing remarkable mechanical dexterity and knowledge of effect, F. painted with what severe critics would call fatal facility. He contributed about a score of pictures annually to the exhibition of the Water-colour Society. But, to do him justice, he always exhibited a certain easy finish of treatment, which was perhaps of itself a kind of secondary talent. Although his range of subjects was but limited, yet within it he was almost unrivalled. As a painter of marine effects, and of the landscapes of down and glade, it is thought by many that he has had as yet no equal.

FIERDING COURT (Fierding Thing), a district court in use among the early Gothic nations. This court was established for the purpose of rendering speedy justice in small matters. There were four of these courts in every hundred, each pres by a separate judge, whose jurisdiction ex all causes where the matter in dispute did n the sum of three marks. Stiernhook, *De* lib. i. c. 2.

III. c. 50). Growing crops, if seized i tion, and sold, are liable for rent accruing date of the seizure, as long as they re the ground (14 and 15 Vict. c. 25). By 1 an c. 110, money, bank-notes, bills of exchar other securities, may be taken under a writ facias. By 8 and 9 Vict. c. 127, a creditor entitled to take wearing-apparel and bed tools where the value of the whole d exceed £5. Such fixtures as belong to t and not to the executor, cannot be taker this writ. The goods of the party only named in the writ may be seized; and officer take goods belonging to a strange liable to an action for damages. By 1 and c. 110, decrees and orders in Chancery h effect of a judgment in a court of law, hen facias and other common law writs proce the former as well as the latter.

Fieri facias de bonis ecclesiasticis is a writ to the bishop of the diocese, requiring him t the ecclesiastical goods of a clergyman wit diocese, in satisfaction of the judgment of of law.

FIE'SCHI, Count Giovanni Luigi, a me one of the most illustrious Houses of Gen born about the year 1523. In addition to th of ancestral fame, his name has attained a historical celebrity in connection with a rem conspiracy of which he was the chief. Doria, a famous admiral, sprung from hereditarily at feud with that of F., having e the forces of Francis I. from the state, had r the republican form of government, but at th time, by his vigorous administration, effectual in check the ambition of the nobles. Co organised a plot, having for its object the d Doria, and his nephew Gianettino, the ob F.'s special hatred, and the establishment oligarchic form of government. Instigated approval of France and Rome, and suppor an alliance with the Duke of Parma, F. s enrolled a formidable array of accomplic three brothers among the foremost. Crowd own feudal retainers were secretly arme assembled from the various hereditary lands House; three galleys, purchased with the com

the pope, were fully equipped, and all being in diness, the attempt was fixed for the 2d of uary 1547. Doria, in spite of repeated warn-s, refused to ascribe treacherous or subversive igns to F., whom he regarded as a fast friend l partisan. Complete success seemed at first to wn the conspirators; the gates of the city were ed, the fleet captured, Gianettino assassinated, ria in flight. F. had but to appear and dictate, : he was nowhere to be found; and the strangest sode of this wild drama is the sudden disappear-e of its hero. In stepping from one galley to the er in the darkness of night, F. stumbled, and ing overboard, was borne down by his ponderous iour, and miserably drowned in the harbour, or, ording to some, stifled in the slime.

FIESCHI, Joseph Marco, known by his attempt the life of King Louis Philippe, was born in sica in the year 1790. His early life contains hing of note. A profligate career appears to have uced him to great poverty about the year 1835, en he conceived the idea of assassinating the g. The immediate cause of his diabolical design the suppression of a situation which he held, order of the prefect of the Seine. Disguising crime under the cloak of political enthusiasm, leagued with himself one or two obscure persons, pothouse politics, who hated the government of Citizen King. These were Pierre Morey, a ller; Pepin, a grocer; and Victor Boireau, a ker of lamps. F. sketched the plan of an rnal machine with twenty barrels, that could simultaneously discharged; got one made, and ced it in a house of the Boulevard-du-Temple. e review of the National Guard held there, h July 1835, afforded F. the opportunity he ired. On the approach of the king and queen, fired his machine. Eighteen people were killed, ong whom was Marshal Mortier, who fell dead ide his sovereign. Louis Philippe, however, self escaped with a mere scratch, and was able continue the review. F. was immediately seized, l along with his accomplices, was tried, con-nned, and executed, 16th February 1836.

FIESOLE (anciently, *Fesulæ*), one of the most ient Etruscan cities, is situated on the crest of ill, at about three miles' distance from Florence, which it may be said to be the parent city. m the heights of F., the view presented by rence and the neighbouring valleys is gorgeous the extreme. We find F. first mentioned in B.C. during the great Gaulish war. Hannibal amped here after crossing the Apennines. The was next destroyed by Sulla in the Social War —89 B.C.), who afterwards despatched thither a itary colony. At the invasion of Tuscany by Goths, F. also fell under their dominion, and ng by nature and art a formidable stronghold, s numerously garrisoned by the barbarians. The wth of Florence during the middle ages gradually uced it to insignificance. It is now a place of ut 2500 inhabitants. The only vestige of Etrus-structures still remaining is the cyclopean city ll, constructed of huge blocks of stone, many tions of which are wonderfully perfect. The site the Etruscan fortress is now occupied by a vent, and interesting fragments of the foundations often brought to light. The amphitheatre and er remains belong to the Roman age. The very ient church of St Alexander, supposed to have ginally served as a pagan temple, contains an r dedicated to Bacchus, the inscription of which however, illegible, owing to a fissure in the dle. Coins and other relics have been repeatedly up.

FIESOLE, Fra Giovanni da, one of the most eminent regenerators of Italian art, also known by the title of *Il beato Angelico*, was born at Mugello in 1387. In 1407, he entered the Dominican order, and, together with his brother, consecrated his artistic abilities exclusively to sacred aims, illustrating various works of devotion with beautiful miniature designs. These early artistic efforts are remarkable for their rich effects of colouring, gorgeous illumination, and exquisite elaboration of the most minute ornamental details. Having achieved a high reputation as fresco-painter by some noble compositions with which he endowed his own and other convents, he was commissioned by Cosmo de' Medici, with the decoration of the church of Santa Annunziata and the convent San Marco. Each cell of the convent was adorned with a fine fresco of large dimensions, and amidst other paintings, one can still distinguish F.'s 'Annunciation.' The fame of this work induced Pope Nicholas V. to summon him to Rome, and intrust him with the execution of a series of illustrations taken from the life of St Laurence, destined to embellish the private chapel of St Laurence in the Vatican. See Giangiacomo Romano, *Le Pitture della Coppella di Nicolò V.*, &c. (Rome, 1810). So rigid a disciplinarian was F., that no private or public work was ever undertaken without the formal consent of his superiors being obtained, and to them all pecuniary remuneration was transferred. The archbishopric of Florence, spontaneously offered him by the pope, was humbly declined. He died in Rome in 1454. The gallery of Florence possesses several pictures of F., still undimmed in brilliancy of colouring. One of these, the 'Birth of John the Baptist,' is a conception full of simple and winning grace. Some of the largest easel-compositions of this artist at present adorn the gallery of the Louvre; among those in the antechamber are the 'Coronation of the Virgin,' and the 'Miracles of St Dominico.' One supreme aim pervades all the creations of F.—that of arousing lofty devotional feeling through the contemplation of the beautiful in art.

FIFE, an ancient wind-instrument of military music, in which the melody is produced by blowing through a hole in a reed or tube, while the escape of air is regulated by the fingers stopping or opening a number of other holes in different parts of the pipe. It has a compass of two octaves, from D on the fourth line of the treble clef to D above in altissimo. The fife figures in the sculptured memorials of the Argonautic expedition, and from that time to this has maintained its place as a simple yet effective instrument for martial purposes. It was common with English troops till the reign of James I., but was then discontinued; to be re-introduced by the Duke of Cumberland at the siege of Maestricht in 1747. It is a universal favourite in the navy, and many a stirring air on drums and fifes has cheered the British sailor to deeds of daring.

In the infantry, there is a *fifer* to each company, and a fife-major to each battalion, the former receiving the daily pay of 1*s.* 1*d.*, the latter, who is a non-commissioned officer, 2*s.*

FIFE-NESS, a promontory of Scotland, the eastmost point of Fifeshire, in lat. 56° 17 N., and long. 2° 35 W. On the north, in the sea, are the dangerous Carr Rocks, with an iron beacon 35 feet high, which required six years to construct. F. is in view of the Isle of May and Bell Rock lights. In the Ness, trap rocks jut through the carboniferous strata, and the rocks contain small caves.

FIFESHIRE, a maritime, almost peninsular county of the east of Scotland, between the Firth of

Forth on the south and the Firth of Tay on the north. It is 44 miles in extreme length from north-east to south-west, and 18 at its greatest breadth; area, 503 square miles; coast-line, 85 miles, mostly rocky, and having many good ports. The surface is a succession of cultivated vales and hills. The hills rise in the West Lomond, 1713 feet, and Largo Law, 1020. The chief rivers are the Tay, Forth, Eden (20 miles long), and Leven (12). F. rests on old red sandstone, with trap rocks in the north, and carboniferous strata, with trap, in the south. There are many coal and iron mines, and lime quarries. The climate is dry, healthy, and mild on the Forth; but the valleys in the north are much exposed to the full sweep of the east and north-east gales. The soil is a rich loam, or wet clay on till. The Howe of Fife, on the Eden, is mostly sandy and gravelly, and not very productive. In 1857, six-sevenths of the surface were in crop, the chief crops being oats, wheat, barley, turnips, flax, and beans. F. has a greater number of proprietors, gentlemen's seats, and plantations, in proportion to its size, than any other Scotch county, and its coasts are thickly studded with towns and villages. The chief manufactures are linen, sea-salt, and malt liquors. The chief exports are coal, lime, and fish. F. contains 61 parishes. Pop. (1861) 154,555. In 1851, there was a population of 153,546; 219 places of worship (77 Established Church, 49 Free, 45 United Presbyterian); 397 public day schools, with 23,145 scholars. It returns one member to parliament. The chief towns are Cupar, the county town, Dunfermline, St Andrews, Kirkcaldy, East and West Anstruther, Burntisland, Crail, and Dysart. The ancient 'Kingdom of Fife' was the most cultivated, as well as the most warlike, of Scotch counties. It contains striking monastic, feudal, and palatial ruins at St Andrews, Dunfermline, Falkland, and Lindores; many Celtic, Roman, and military remains, and a round tower at Abernethy. Many of the events connected with the Scottish Reformation took place here.

FIFTEENTH, a stop in English organs tuned two octaves above the diapasons, the lowest C pipe of which is two feet long.

FIFTH MONARCHY MEN. Among the strange and whimsical forms of opinion which the religious and political fermentation of the 17th c. brought to the surface of society, and embodied in the shape of religious sects, were those of the Fifth Monarchy Men. The date which has been assigned to their first appearance is 1654. Notwithstanding the ridicule with which they have often been overwhelmed, there seems nothing in their tenets more objectionable than we find in those of many of the other sects of the period, and there is no reason to believe that the practices of their leaders exceeded in absurdity, or equalled in impiety, those of Robbins, Reeve, Muggleton, and other apostles of the Ranters. In common with most persons who hold the literal interpretation of prophecy, they believed in the four great monarchies of Antichrist marked out by the prophet Daniel; and quite consistently with Christian orthodoxy, they added to them a *fifth*—viz., the kingdom of Christ on earth. So far, there was nothing peculiar in their views. But their error was twofold. 1*st*. They believed in the immediate, or at least in the proximate, advent of Christ (a tenet which was common to them with the early church); and 2*d*. They held that the fulfilment of God's promise to this effect must be realised by the forcible destruction of the kingdom of Antichrist. Every obstacle which opposed itself to the setting up the Messiah's throne was to be thrown down, and what these obstacles were was a question for the solution of which the only criterion which presented itself was their own fanatical prejudices and hatreds. It is obvious that such doctrines in such times must have given rise to practical as well as speculative disorder. The Fifth Monarchy Men became extinct as a sect shortly after the Restoration; a fact which, by depriving them of exponents of their own body, may have exposed them to misrepresentation (Marsden's *History of the Later Puritans*, p. 387). In politics, the Fifth Monarchy Men were republicans of the extremest section; and when their conspiracy to murder the Protector, and revolutionise the government, was discovered in 1657, their leaders, Venner, Grey, Hopkins, &c., were imprisoned in the Gate House till after the Protector's death. Amongst their arms and ammunition which was seized, was found a standard exhibiting a lion couchant, supposed to represent the lion of the tribe of Judah, with the motto, 'Who will rouse him up?'—Niel's *Puritans*, vol. iv. p. 186. See also Carlyle's *Cromwell's Letters and Speeches*, vol. iii. p. 31.

FIG (*Ficus*), a genus of trees and shrubs belonging to the natural order *Moraceæ*, and distinguished by having the flowers—male and female mixed—within an almost closed top-shaped fleshy receptacle, which enlarges to form the fruit, and encloses numerous one-seeded carpels, imbedded in its pulp. There are more than 100 species, some of them very large trees. Almost all belong to tropical and sub-tropical countries, of the vegetation of which they often form a most important feature. They abound in India, in every jungle and hilly situation, to the most northern Himalaya, and some of them are cultivated about every village. Both *F. religiosa* (the Peepul) and *F. Rumphii* are held in veneration by the Hindus. The most notable species are the Common Fig (see below); the Banyan (q. v.); the Peepul (q. v.), Bo Tree or Sacred Fig of India; the Sycamore (q. v.); and the East Indian Caoutchouc (q. v.) Tree. The leaves of some species are entire, those of others are lobed. Several species of fig exhibit the character for which the banyan in particular has become celebrated, of sending roots straight down to the ground from their spreading branches, and thus multiplying the apparent stems, by which a vast canopy of branches and foliage is supported. The East Indian Caoutchouc or India Rubber Tree is remarkable for the exposure of its roots, which appear in masses above ground, extending on all sides from the base like great writhing snakes. Some figs are creeping or trailing shrubs, with slender stems, covering heaps of stones, or ascending trees like ivy.—Besides the Common Fig, many species yield edible fruits, although none of them are nearly equal to it in value. Amongst them are the Peepul (*F. religiosa*), *F. Benjamina*, *F. pumila*, *F. auriculata*, *F. Rumphii*, *F. Bengalensis*, *F. aspera*, *F. racemosa*, and *F. granatum*, all East Indian, also the Sycamore of Egypt.—The milky juice of some species is bland and abundant, as of *F. Sauresiana*, which has therefore been ranked among Cow-trees. In other species, the milky juice is very acrid. That of the Common Fig produces a burning sensation on the tongue. That of *F. toxicaria*, a native of the Malayan islands, is used for poisoning arrows.—Lac (q. v.) is gathered from some species.—The leaves of *F. politoria* are so rough that they are used for polishing wood and ivory in India. The juice of the fruit of *F. tinctoria* is used in Tahiti to dye cloth: the colour is at first green, but being acted on by the juice of a *Cordia*, it becomes bright red. The bark supplies cordage, of which fishing-nets are made.

The Common Fig (*Ficus Carica*) is a native of the East, as the specific name *Carica* (from *Caria*)

orts; but it is now cultivated throughout the
ds of the south of Europe, and is even found
naturalised there. Its cultivation has also extended
many warm countries. In North America, it is
lom to be seen further north than Philadelphia;

Common Fig (*Ficus Carica*):
a, male flower, magnified; *b*, male flower, natural size; *c*, female flower, magnified; *d*, female flower, natural size.

it is not sufficiently hardy to be a common fruit
in Britain, although even in Scotland figs may
sionally be seen ripened on a wall; and in the
h of England fig-trees are sometimes grown as
dards, and a few small fig orchards exist. Pro-
ion is always given in some way during winter.
r Paris, and in some other parts of the continent
urope, fig-trees are so trained that the branches
be tied in bundles and laid along the ground,
n they are covered with litter and earth. The
a low deciduous tree or shrub, with large deeply
d leaves, which are rough above, and downy
ath. The branches are clothed with short hairs,
the bark is greenish. The fruit is produced
ly in the axils of the leaves, is pear-shaped, and
a very short stalk; the colour in some varieties
ish-black; in others, red, purple, yellow, green,
hite. The varieties in cultivation are numerous.
warm climates, the fig yields two crops in the
—one from the older wood (midsummer shoots of
preceding year), and a second from the young
d (spring shoots of the same year); but in colder
ons the latter never comes to perfection. Fig-
s are propagated by seed, by suckers, &c.; very
uently by layers or by cuttings. In Britain,
r are often to be seen in hothouses, and grow
in pots. Dried figs form an important article
ood in the Levant; in more northern regions,
r are used for dessert, or for medicinal purposes,
g applied to gumboils and other sores, and also
unistered in pulmonary and nephritic affections,
to relieve habitual constipation. The pulp
ains about 62 per cent. of a kind of sugar called
ar of Figs. Figs are either dried in the sun
in ovens built for the purpose. Great quan-
s are annually imported into Britain from the
Mediterranean. The best are mostly brought
a Smyrna, and are known as *Turkey figs*, of
ch those called *Eleme* or *Elemi* are most highly
emed. Figs of inferior quality are imported in
siderable quantities in the form of *fig-cake*,
ed along with almonds into cakes some-
t like small cheeses. In the Levant, Portugal,
and the Canaries, a spirit is distilled from fermented figs.

FI'GARO, a dramatic character introduced on the Parisian stage in 1785 by Beaumarchais (q. v.) in his *Barbier de Seville* and his *Mariage de Figaro*. These plays, in which F., who coolly outwits every one, is first a barber and then a valet-de-chambre, secured for their author a brilliant reputation not only in France, but also in Germany, where many translations and adaptations of the pieces appeared. Mozart, Paesiello, and Rossini also made them the basis of classic operas. Since their publication, the character of F. has stood as a type of cunning, intrigue, and dexterity. After the restoration of the Bourbons, a literary periodical, distinguished for its satirical talent, assumed the name.

FIGEAC, a town of France, in the department of Lot, is situated in a valley surrounded by finely wooded hills on the right bank of the Sellé, 32 miles east-north-east of Cahors. It is irregular, its streets are narrow, and badly planned, and its houses in general not well built, but the antiquity and quaintness of many of its buildings give it a picturesque and interesting appearance. It has two beautiful Gothic churches, one of them, that of St Sauveur, has a choir of the 11th, a general superstructure of the 15th, and a modern front of the 19th century. F. owes its origin to a Benedictine monastery, founded by Pepin in 755 A.D. It has some cotton manufactures, and a trade in wine and cattle. Pop. 6820.

FIGHTING FISH (*Macropodus pugnax* or *Ctenops pugnax*), a small fresh-water fish, of the family *Anabasidæ* (q. v.), a native of the south-east of Asia, and particularly of Siam, where it is very commonly kept as goldfishes are in Britain, but on account of its pugnacity. Two of these creatures when brought together, often rush immediately to combat, or it is even enough to introduce a looking-glass into the water, and the fish hastens to attack its own image. Fish-fights are a favourite amusement of the Siamese; the licence to exhibit them yields a considerable annual revenue; and an extraordinary amount of gambling takes place in connection with them; not merely money and property, but children and liberty being sometimes staked. The F. F. has the anal and dorsal fins prolonged into tapering points. When the fish is quiet, its colours are dull; but when it is excited, they glow with metallic splendour, and 'the projected gill-membrane, waving like a black frill around the throat, adds something of grotesqueness to the general appearance.'

FIGUE'RAS, a town in the north-east of Spain, is situated near the French frontier, in the province of Gerona, in a fruitful district, 20 miles north-north-east of the town of Gerona. Its streets are gloomy, but it has beautiful promenades. On a height near the town is the citadel of S. Fernando, the strongest fortress of Spain, and the key of the Pyrenees on their south side, with accommodation for 20,000 men. This fortress has been so frequently taken by the French, as to give rise to the remark, common enough among the Spaniards, that the citadel of S. Fernando, in time of peace, belongs to Spain, but in time of war to France. Pop. 8350.

FI'GULINE. See POTTER'S CLAY.

FIGURANTES is the term applied in the ballet to those dancers that do not come forward alone, but dance in troops, and also serve to fill up the scene and form a background for the solo dancers.

FI'GURATE NUMBERS. The nature of

figurate numbers will be understood from the following table:

	1,	2,	3,	4,	5,	6,	7, &c.
I.	1,	3,	6,	10,	15,	21,	28, &c.
II.	1,	4,	10,	20,	35,	56,	84, &c.
III.	1,	5,	15,	35,	70,	126,	210, &c.
		&c.				&c.	

The natural numbers are here taken as the basis, and the first order of figurate numbers is formed from the series by successive additions; thus, the 5th number of the first order is the sum of the first five natural numbers. The second order is then formed from the first in the same way; and so on.

If instead of the series of natural numbers, whose difference is 1, we take series whose differences are 2, 3, 4, &c., we may form as many different sets of figurate numbers. Thus:

	1	3,	5,	7,	9, &c.
I.	1,	4,	9,	16,	25, &c.
II.	1,	5,	14,	30,	55, &c.
III.	1,	6,	20,	50,	105, &c.
		&c.			&c.

Or—

	1,	4,	7,	10,	13, &c.
I.	1,	5,	12,	22,	35, &c.
II.	1,	6,	18,	40,	75, &c.
III.	1,	7,	25,	65,	140, &c.
		&c.			&c.

The name *figurate* is derived from the circumstance, that the simpler of them may be represented by arrangements of equally distant points, forming geometrical figures. The numbers belonging to the first orders receive the general name of *polygonal*, and the special names of *triangular*, *square*, *pentagonal*, &c., according as the difference of the basis is 1, 2, 3, &c. Those of the second orders are called *pyramidal* numbers, and according to the difference of the basis, are triagonally, quadragonally, or pentagonally pyramidal. The polygonal numbers may be represented by points on a surface; the pyramidal by piles of balls.

The general formula for polygonal numbers, from which any particular one may be found by substituting the proper values for n and r is,

$$\frac{(r-2)\,n^2-(r-4)n}{2}$$

where n = number of the term required, r = the denomination (3 if triagonal, 5 if pentagonal, &c.).

FIGURE, in general, is the outline or surface of a body determining its form or shape. In Arithmetic, figure denotes a numerical character such as 1, 2, 3, &c. Figure, in Geometry, denotes a surface or space enclosed on all sides, and is superficial when enclosed by lines; solid, when by surfaces. See REGULAR FIGURES, SIMILAR FIGURES, &c.

FIGURED BASS, in Music, is a bass part with figures placed over the notes, which indicate the harmony to be played to each note, and serves as a guide to the accompanist. Ludovico Viadana is said to have been the inventor of figured bass in the 17th century.

FIGURE-STONE. See SOAP-STONE.

FI'GWORT (*Scrophularia*), a genus of plants of the natural order *Scrophulariaceæ*, having a nearly globose corolla, with a small 5-lobed limb; the lowest lobe reflexed; and four stamens with an additional rudimentary one. They are mostly herbaceous plants, and natives of the temperate parts of the eastern hemisphere, not possessed of much beauty either in flowers or foliage. The roots of some are purgative and emetic. The leaves of the KNOTTED F. (*S. nodosa*), a common plant in moist grounds in Britain, are used for fomentation of tumours, repellent powers being ascribed to them, and in the form of an ointment in diseases. A decoction of them is used to in swine. They have a fetid odour when and their taste is acrid. The tuberous formerly esteemed in scrofula, but perhaps account of a supposed resemblance to tumours.

FIJI, FEEJEE, or VITI ISLANDS, of islands of volcanic origin, in the South Ocean, situated in lat. 15° 30′—20° 30′ S., 177°—178° W. They were discovered by the Dutch navigator, in 1643. There are about 225 islands, 80 of which are said to bited. The principal are—Viti Levu, or G and Vanua Levu (Great Land), the form an area of about 90 miles by 50, with an population of 50,000, and the latter exten 100 miles in length, with a breadth of 20 a population of about 30,000. The total p of the group has been variously stated 130,000 to 300,000. Of the other islands, important and best known are Ovolau, the of most of the whites; Vuna, or Somoson davu, Koro, Mbau, and Taviuni. Shoals surround the islands, making the access very dangerous. Earthquakes are comm destructive hurricanes are periodical. The ture ranges from 60° or 70° to upwards of the mean is set down at about 80°. O Levu, there are several hot springs, rang 200° to 210°. The soil, which is of a de loam, and well watered, is exceedingly fer to the very summits of the mountains, Great Fiji, reach an elevation of more than The chief vegetable productions are the b tree, the banana, plantain, and cocoa-nut. and the taro are extensively raised, and g is bestowed on the culture of the yangon from which an intoxicating liquor is obtain sugar-cane, arrow-root, nutmeg, caraway, tea-plant, &c., flourish. Cotton grows kinds of tomato are found, and the botan as can be judged, is rich. The domestic seem to be limited to a few fowls and ho agricultural implements of the Fijians ar most primitive character; but in manufa a rude kind they are further advanced th Polynesians. The natives are of middle siz limbed and short necked; complexion be copper colour and a black, and hair dar and bushy. They are horrible cannibals, wrecked mariners frequently fall victims insatiable appetite for human flesh, though said to prefer coloured to white men, obj the latter that 'they smell too much of The Fijians are divided into various tril governed by its own chief, whose rule is and to whom, in a variety of ways, the mo homage is tendered. Of late years, gres for their conversion have been made, e by Wesleyan missionaries. In 1857, the 54,281 attendants upon the religious serv ducted by these missionaries. Compare and Calvert's *Fiji and the Fijians* (2 vol 1858). A letter in the *Athenæum* (Febr 1862), and dated 'Levuka, Fiji, August affords still more recent information co these islands. From this source, we learn order to escape from the insupportable and tyrannies of the Tonguese (the bold most ambitious of all the Polynesians), w planted hostile colonies in Great Fiji, the chiefs of this island formally offered to c Great Britain. Her Majesty's consul, Mr P at once hastened to England with the n on his return intimated to the Fijians t

s government had taken the cession into le consideration. The king and chiefs n solemnly ratified their offer, and to all nd purposes the island may be now regarded ritish possession. Its progress (1861) is r quite visible already. 'Men of capital,' writer in the *Athenæum*, 'are beginning to her; flourishing plantations of sugar, coffee, on are established, and extensive tracts of e been purchased for sheep runs.'

NGIE'RI, GAETANO, one of the most dis-ed judicial writers and reformers of his was born of noble parentage at Naples in laving early abandoned the career of arms he was originally destined, he devoted his to the study of morals, politics, and legis-In 1774, the promulgation of some wise reforms, limiting the arbitrary jurisdiction s, having met with considerable opposition ese legal officials, young F. published a f the royal decree, and at once attracted the le notice of court and minister. In 1777, appointed court-chamberlain; and in 1780, i the first volume of his great work, *La ielle Legislazione*. The first part is devoted alysis of the essentially fixed ethics of legis-ed of those principles which are modifiable g to local and national exigences; the reats of the two great problems of all poli-nomy, wealth and population; the third, nal law in its widest extent; the fourth, of nstruction; and the fifth, which considers ical and religious law, was on the eve of ublished, when its author, in 1788, was rely cut off at the age of 36, leaving in this incomplete but splendid monument to the nse of justice and the exalted humanity thor. The best Italian edition, which also his *Opuscoli Scelti*, is in *I Classici Italiana* lvo, Milan, 1822).

, FILING. A file is a steel tool, having ce covered with teeth or serratures, and r cutting down and shaping metals and rd substances. There is little doubt that rliest stages of metal-working, when bronze nts first superseded those of stone, rough ere used for the purposes to which files applied; nevertheless, the use of files dates h antiquity. They are mentioned in the tament in the first book of Samuel, xiii. n the *Odyssey*.

re made of almost every conceivable shape, the very varied purposes to which they ied—flat, square, round or *rat-tail*, trian-lf-round, feather-edged, &c., besides being y bent, in order to get at intricate work. ll these files are made thicker in the middle, ed,' the object of which will be explained LING.

require to be made of the very best steel, first forged into the required shape, and is led a 'blank.' The blanks are then finished curately to the required form by grinding, or filing.

lanks thus prepared and well softened (see NG) are next handed to the cutter, who ide on a low bench or stool, and has before tone anvil, with a flat piece of pewter laid

The blank is held upon the anvil, with towards the cutter, by means of a long leather-strap, into which the cutter places his foot. He then cuts the teeth by striking with a hammer a short stout chisel, held obliquely at an angle of about 12° or 14° from the perpendicular. The object of this will be easily understood; for, if the chisel were perpendicular, a furrow like the letter V would be indented, and an equal burr struck up on each side; but, instead of this, a cutting tooth like that of a saw, but with less obliquity, is required; this is effected by the obliquity of the chisel, and a burr is thrown up on one side only—viz., towards the tang.

The astonishing regularity observable in the distance between the teeth is secured in this way: The cutting is commenced at the point of the file; the chisel is then drawn backwards, laid upon the blank, and slid forwards till it reaches the burr raised by the last cut; the blow is now struck, and another tooth and burr produced, which serves as a guide for the next cut; and so on. The distance between the teeth thus depends on the force of the blow and the obliquity of the cut; for the heavier the blow, the greater the ridge or burr, and the obliquity determines the distance of the cut from the burr; the skill of the workman consists, therefore, in the precise regulation of the blows

Most files are double cut—that is, they have two series of *courses* of chisel-cuts, which are oppositely inclined at an angle of about 55° to the central line of the file. The second course is made in the same manner as the first, but with lighter blows, and is usually somewhat finer than the first. This angular crossing converts the ridges into pointed teeth. Files used for soft metals which are liable to clog the teeth, are single cut—that is, they have but one course of cuts. Taper files have the teeth finer towards the point. Rasps for wood are cut with pointed chisels; each tooth being an angular pit with a strong burr, instead of a long furrow. The newly cut teeth in the soft steel are preserved from injury by being laid upon the softer pewter block before referred to. The rapidity with which the blows are struck varies with the fineness of the file; 60 or 80 cuts are commonly made per minute.

Files have to be very carefully hardened and tempered. If heated too strongly, or made too hard, the steel is so brittle that the teeth tear off; if too soft, they wear down rapidly, and the file soon becomes useless. Great care is also required in keeping them straight, as the sudden cooling necessary for hardening is very apt to warp the steel.

At first sight, it would appear, from the simplicity and continual repetition of the movements required in file-cutting, and the precision and regularity of the work, that it is an operation specially adapted for machinery. Many attempts have been made to cut files by machinery, but with only partial success; the chief difficulty arises from the necessity of modifying the force of the blow to suit the hardness of the steel. It is practically impossible to supply a large number of blanks all of exactly the same hardness; and if the machine be adjusted to suit the hardness of one blank, it may strike too heavy or too light a blow for the next; whereas the workman *feels* at once the hardness of the steel he is working upon, and adjusts his blows accordingly.

FILING.—To the uninitiated, this may seem a simple operation of rubbing one piece of metal upon another, and requiring only muscular strength and no skill. This is far from being the case, for a skilful workman will, in a given time, with a given amount of muscular work, cut away a far greater quantity of metal with a file than one who is unskilful, for he makes every tooth *cut into* the work, instead of *rubbing over* it. To do this, he must adapt the pressure and velocity of motion of the file to the coarseness of its teeth, and the hardness,

brittleness, and toughness of the material he is working upon.

To *file flat*, that is, to avoid rounding the sharp edges of a narrow piece of work, is very difficult, and some years of continual practice is required before an apprentice can do this well, especially in 'smoothing up' or finishing work before polishing, and there are some who never succeed in filing, smoothing, and polishing without rounding the edges of fine work. The power of doing this constitutes the main test of skill among mathematical instrument makers and other metal-workers. The flattest surface can be obtained by laying the work, where its form admits, upon a piece of cork held in the vice, and filing it with *one hand*, the pressure on the file being communicated by the forefinger.

It is mainly to aid the workman in filing flat that the rounded or bellied form is given to files; this partially compensates the tendency of the hands to move in a curved line with its convexity upwards when they move forward and apply pressure, as in the act of filing.

FILE (Fr. *file*, a row, Lat. *filum*, Ital. *fila*, *filo*), in a military sense, is used to signify any line of men standing directly behind each other, as *rank* refers to men standing beside one another. In ordinary formations of the present day, a battalion stands two deep, or in two ranks—front and rear—wherefore a file consists of two men. Sometimes, however, the battalion may be formed much more solidly, as in a square, when the file comprises a far larger number. The number of files in a company describes its width, as the number of ranks does its depth: thus, 100 men in 'fours deep' would be spoken of as 25 files in 4 ranks.

FILIA'TION, the correlative of paternity. In the law of Scotland, the filiation of a child is the process by which its paternity is determined. The general rule that the father is he whom the marriage points out (*pater est quem nuptiæ demonstrant*), is a presumption which may be overcome by shewing its impossibility in point of fact—as, for example, where the husband is impotent, or where he has been absent from his wife during the period between the eleventh solar and the sixth lunar month preceding the birth. As regards natural children, a *copula* more than ten months before birth does not filiate, but it forms an important adminicle of proof, which, till the passing of 16 Viet. c. 20, it was held might be completed by the oath of the mother. As to the effect of that statute on the previously existing law, see EVIDENCE, and SEMI PLENA PROBATIO.

FILICA'JA, VINCENZO, a lyrical poet of Italy, was born at Florence, of an ancient but impoverished family, in 1642. Deeply wounded, while yet a youth, in his affections, he resolved to dedicate his undivided genius to heroic, martial, and sacred themes, forswearing all amatory compositions for the future, and perversely consigning his exquisite love inspirations to the flames. In six sublime odes, F. celebrated the deliverance of Vienna in 1683 from the besieging forces of the Turks, chiefly effected by the heroism of John Sobieski, king of Poland, and of Charles Duke of Lorraine. On the publication of the odes in Florence in 1684, F. became, almost in spite of himself, famous, and attracted the notice of Queen Christina of Sweden, an ardent admirer and munificent protectress of Italian letters and genius. Relieved from harassing pecuniary embarrassments by the liberal patronage of Christina, F. was enabled, with undisturbed powers, to devote himself to composition, some of his most touching verses being addressed to his royal benefactress. Patriotic sonnets, the grandest of which is a lament over the internal weakness of Italy—*Italia, Italia, O tu cui feo la sorte*—and heroic odes, severely classic in form, are the chief works of Filicaja. His career as patriot, citizen, and man, won him reverence and love as universal as was the admiration accorded to his works. In advanced age, he was appointed judge and senator, and in 1702 was called to one of the highest magisterial offices in Florence, where he died in honoured peace, September 24, 1707. His works, under the title of *Poesie Toscane di Vincenzo da Filicaja, Senatore Fiorentino e Accademico della Crusca*, were published after his death. The best edition is that of Venice (2 vols. 1762), containing both the Italian and Latin verses of the author.

FI'LICES. See FERNS.

FI'LIGREE, from the Italian *filigrana* (*filo*, a thread or wire, and *grano*, a grain or bead), the old filigree-work being ornamented with small beads. The name is now applied to delicate wire-work ornaments, usually made of gold or silver wire, which is twisted into spirals and other convoluted

Filigree Ornaments:
From a drawing by M. Mariana, in the Florence Exhibition (1861).

forms; and these spirals, &c., are combined to form a sort of metallic lace-work, which is shaped into brooches, earrings, crosses, head ornaments, and others of a very light and elegant character. This work is chiefly done in Malta, Sardinia, the Ionian Islands, and some parts of Turkey. It sometimes receives the general name of *Maltese work*.

FI'LIPO-D'ARGIRO, SAN, a town of Sicily, in the province of Catania, and about 30 miles west-north-west of the town of that name, stands on the right bank of the Traina, in an exceedingly fertile district. It contains a ruined Saracenic castle, and several religious edifices. Saffron of good quality, and in considerable quantity, is grown in the vicinity. Pop. 7300. San F. stands on the site of the ancient Sikelian city of Agyrium, the birthplace of Diodorus Siculus the historian, and which, about 400 B.C., is said to have had 20,000 citizens.

FI'LLAN, ST. Two Scoto-Irish saints of the name of Fillan appear in the church calendars, and have left their mark on the topography of Scotland and Ireland. (1.) ST FILLAN, or Faolan, surnamed the Leper, had his yearly festival on the 20th of June. His chief church in Scotland was at the east end of Loch Erne, in Perthshire, where 'St Fillan's Well' was long believed to have

atural powers of healing. A seat in the rock afillan still keeps the name of 'St Fillan's ;' and two cavities beside it are said to have ollowed by St F.'s knees in prayer. His Irish i is at Ballyheyland (anciently called Kill- or Kill Faelain), in the barony of Cullenagh, een's County. (2.) ST FILLAN, the abbot, the f St Kentigerna of Inchcailcoch, in Loch d, lived in the 8th c., and had his yearly l on the 7th or 9th of January. His church land was at Cluain Maosena, in Fartullach, county of Westmeath. His chief church in d was in Perthshire, in the upper part of chart, which takes from him the name of fillan. Here, a well-endowed priory, dedi- in his honour, was repaired or rebuilt in the ing of the 14th century. King Robert Bruce a grant of money to the work, in gratitude, ly, for the miraculous encouragement which said to have received on the eve of Bannock- rom a relic of the saint—one of his arm- enclosed in a silver case. Another relic of St e silver head of his crosier, or pastoral staff been preserved to our time. It is called the rach' or 'Quigrich,' and appears in record ly as the year 1428, when it was in the here- keeping of a family named Jore or Dewar, rere believed to have been its keepers from ne of King Robert Bruce. They had half a meal yearly from every parishioner of Glen- t who held a merk land, and smaller quan- from smaller tenants; and they were bound, urn, to follow the stolen cattle of the parish- wherever their traces could be found within alm of Scotland. The Quigrich, besides its in the detection of theft, was venerated also miraculous powers of healing. In 1487, the f keeping it was confirmed to Malice Doire or by King James III. in a charter, which was ted for registration among the public records tland so lately as the year 1734. Sixty years he Quigrich still commanded reverence; but ding virtues were now only tried on cattle, once opulent keepers had fallen to the rank n-labourers. It was publicly exhibited in urgh in the year 1818, before being carried nvia, where it now is, in the hands of a dant of its old custodiers, a farmer named nder Dewar. He puts such a value on the hat he has hitherto refused to part with it than £400 sterling, or 1000 acres of Canadian It has been recently figured and described by nel Wilson in a paper in the *Canadian Jour-* o. xxiv., reprinted in a pamphlet, with the *The Quigrich, or Crosier of St Fillan* (Toronto, ; and in the *Proceedings of the Society of uries of Scotland*, vol. iii. part ii. p. 233, plate (Edin. 1861). A linn in the river Fillan chart, in Strathfillan, was long believed to wonderful cures on insane persons, who were ed in the stream at sunset, and left bound and foot till sunrise in the ruins of the neigh- bouring church of St Fillan. A hand-bell, which bore the name of St Fillan, was also believed to work miracles.

Fillets.

FILLET, in Architecture, a small space or band like a narrow ribbon used along with flings. *a*, *a*, *a* (see fig.) are examples of fillets, n classic and Gothic architecture.

LLET, in Heraldry, is an ordinary which, according to Guillim, contains the fourth part of the chief.

FI'LLIBUSTERS, another name for the piratical adventurers whose origin and history are treated of under BUCANEERS (q. v.). Recently, it has become familiar to English ears as the designation of certain lawless adventurers belonging to the United States, who have attempted violently to possess themselves of various countries in North America. The plea urged by these persons has generally been, that such countries were a prey to anarchy and oppression, and could only attain to prosperity by annexation to the United States, and the introduction of 'democratic' institutions—amongst which, strange to say, slavery stands prominent. The most notorious of these fillibusters was the late William Walker, whose expedition against Nicaragua in 1855 was so far successful that he kept his ground in that country for nearly two years. At last, he was driven out by a combination of the various states of Central America. He was subsequently captured and shot, September 12, 1860, at Truxillo, in Central America, in the course of another piratical expedition.

FILLMORE, MILLARD, an American statesman, the thirteenth president of the United States, was born in Cayuga county, New York, on the 7th of January 1800. His history presents a remarkable example—not, however, unparalleled in America—of one who, without the advantages of early education, and without any aid from influential connections, has risen to the very highest position in the government. His parents removed, near the close of the last c., from New England to Cayuga county, which was then a wilderness. Young F. reached, it is said, the age of 19 without ever having seen a grammar or a geography. In 1821, he removed to Erie county, in the western part of New York, making the journey principally on foot. Soon after, he entered a law-office in Buffalo, and, while pursuing his legal studies, supported himself by teaching a school. He commenced the practice of law at Aurora, in Erie county, and in a few years rose to eminence in his profession. He was elected in 1829 to the state legislature, and in 1832 was chosen a representative to Congress. Here he distinguished himself by the faithfulness and ability with which he discharged his public duties. He was elected in 1832 by the anti-Jackson party, and was re-elected as a Whig in 1836, 1838, and 1840. In 1841, Mr F. was appointed chairman of the committee of Ways and Means, after the speakership, the most responsible as well as the most honourable position in the House of Representatives. Under his auspices and direction, the celebrated tariff of 1842 was prepared and carried through the House. In 1848, he was elected to the vice-presidency of the United States, with General Taylor as president, and entered upon the duties of his office in March 1849. General Taylor having died in July 1850, Mr F. succeeded to the presidency for the unexpired portion of the term of four years. Although his party was a minority in both houses of Congress, his administration was marked by a number of useful measures, and rarely has a president of the United States acquired and deserved so high a character for vigour, firmness, and impartiality. Among his most important measures may be mentioned the expedition sent out under Commodore Perry for the purpose of opening the ports of Japan to American commerce—an undertaking which was, at least for the time, eminently successful. When he retired from office on the 4th of March 1853, he left the country in the enjoyment of a high degree of prosperity. He was the

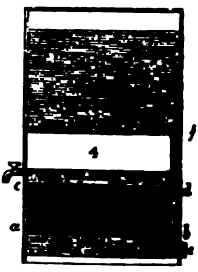
candidate of the American party for the presidency in 1856; but in the contest which followed, Mr Buchanan, the democratic nominee, was chosen president. Since his retirement from public life, Mr F. has resided at Buffalo—which has been his home for some thirty years—where he enjoys among all classes that high consideration to which, by his talents and integrity, he is so justly entitled.

FILTER, FILTRATION. When solid matter is suspended in a liquid in which it is insoluble, it may be separated by various means. Under the article FINING, various methods of causing such suspended matter to collect together and sink to the bottom or float on the surface, and thereby clearing the liquid, are described. The process of filtration consists in passing the liquid through some porous substance, the interstices of which are too small to admit of the passage of the solid particles, the principle of the action being the same as that of a sieve; but as the particles of fluids are immeasurably small, the pores must be extremely minute.

One of the simplest forms of filter is that commonly used in chemical laboratories for separating precipitates, &c. A square or circular piece of blotting-paper is folded in four, the corner where the four folds meet is placed downwards in a funnel, and one side is partly opened, so that the paper forms a lining to the funnel. The liquid passes through the pores of the paper, and the solid matter rests upon it. The chief advantages of this filter are its simplicity, and the ease with which the solid matter may be removed and examined.

A simple water-filter for domestic purposes is sometimes made by stuffing a piece of sponge in the bottom of a funnel or the hole of a flower-pot, and then placing above this a layer of pebbles, then a layer of coarse sand, and above this a layer of pounded charcoal three or four inches in depth. Another layer of pebbles should be placed above the charcoal, to prevent it from being stirred up when the water is poured in. It is obvious that such a filter will require occasional cleaning, as the suspended impurities are left behind on the charcoal, &c. This is best done by renewing the charcoal, &c., and taking out the sponge and washing it. By a small addition to this, a cottage-filter may be made, which, for practical use, is quite equal to the most expensive filters of corresponding size. It consists of two flower-pots, one above the other; the lower one is fitted with the sponge and filtering layers above described, and the upper one with a sponge only. The upper pot should be the largest, and if the lower one is strong, the upper one may stand in it, or a piece of wood with a hole to receive the upper pot may rest upon the rim of the lower one. The two pots thus arranged are placed upon a three-legged stool with a hole in it, through which the projecting part of the lower sponge passes, and the water drops into a jug placed below. The upper pot serves as a reservoir, and its sponge stops the coarser impurities, and thus the filtering layers of the lower one may be used for two or three years without being renewed, if the upper sponge be occasionally cleaned. Care must be taken to wedge the upper sponge tightly enough, to prevent the water passing from the upper pot more rapidly than it can filter through the lower one.

A great variety of filters are made on a similar principle to the above, but constructed of ornamental earthenware or porcelain vessels of suitable shape. It would occupy too much space to enter upon the merits of the filters of different makers, especially as there is really very little difference between them in point of efficiency, and nearly all the domestic filters that are offered for sale are well adapted for their required purpose. In purchasing a filter, the buyer must not be satisfied with merely seeing that the water which has passed through it is rendered perfectly transparent—this is so easily done by a new and clean filter—but he should see that the filter is so constructed as to admit of being readily cleansed, for the residual matter must lodge somewhere, and must be somehow removed. When large quantities of water have to be filtered, this becomes a serious difficulty, and many ingenious modes of overcoming it have been devised. In most of these, water is made to *ascend* through the filtering medium, in order that the impurities collected on it may fall back into the impure water. Leloge's ascending filter consists of four compartments, one above the other; the upper part, containing the impure water, is equal in capacity to the other three. This communicates by a tube with the lower one, which is of small height. The top of this is formed by a piece of porous filtering-stone, through which alone the water can pass into the third compartment, which is filled with charcoal, and covered with another plate of porous stone. The fourth compartment, immediately above the third, receives the filtered water, which has been forced through the lower stone, the charcoal, and the upper stone. A tap is affixed to this, to draw off the filtered water, and a plug to the second or lower compartment, to remove the sediment.



Leloge's Filter:
1, 2, 3, 4, the four compartments; *ab*, the first porous stone of third or filtering compartment; *cd*, the exit filtering stone of *d*; *e*, the plug to remove for cleaning out second compartment; *f*, a loose sponge at entrance of communicating tube.

In the diagram shewing this filter in section, the figures 1, 2, 3, and 4 indicate the corresponding compartments. At *f*, the top of the tube by which the first and second compartments communicate, a sponge may be placed to stop some of the grosser impurities.

Since 1831, when this filter was contrived, a number of ascending filters have been patented, many of them being merely trifling modifications of this. Bird's Syphon Filter is a cylindrical pewter vessel containing the filtering media, and to it is attached a long coil of flexible pewter pipe. When used, the cylinder is immersed in the water-butt or cistern, and the pipe uncoiled and bent over the edge of the cistern, and brought down considerably below the level of the water. It is then started by applying the mouth to the lower end, and sucking it till the water begins to flow, after which it continues to do so, and keeps up a large supply of clear water. This, of course, is an ascending filter, and the upward pressure is proportionate to the difference between the height of the water in the cistern and that of the lower end of the exit tube. See SYPHON. Sterling's filtering tanks are slate cisterns divided into compartments, the water entering the first, then passing through a coarse filter to a second, and from there through a finer filter to the main receptacle, where the filtered water is stored and drawn off for use.

A common water-butt or cistern may be made to filter the water it receives by the following means: Divide the cistern or butt into two compartments, an upper and a lower, by means of a water-tight partition or false bottom; then take a wooden box

all barrel, and perforate it closely with holes; tube into it, reaching to about the middle of side, and projecting outside a little distance; e box or barrel with powdered charcoal, tightly ed, and cover it with a bag of felt; then fit rojecting part of the tube into the middle of lse bottom. It is evident that water can only rom the upper to the lower compartment by through the felt, the charcoal, and the tube, hus, if the upper part receives the supply, and ater for use is drawn from the lower part, hole will be filtered. It is easily cleaned by ring the felt and washing it.

rious means of compressing carbon into solid s masses have been patented, and filters are in which the water passes through blocks of ompressed carbon. Most of these are well ed for the purpose, but their asserted supe- y over filters composed of layers of sand and oal is doubtful. A very elegant and con- at portable filter for soldiers, travellers, and s who may require to drink from turbid ponds rivers, was constructed of Ransome's filtering , and is also made of the compressed carbon. all cylinder of the stone or carbon is connected a flexible India-rubber tube in such a manner the cylinder may be immersed in a river, the applied to a mouth-piece at the other end of ube, and the water drawn through the filtering ler.

e filtration of water on a large scale will be d of under WATER-SUPPLY.

ne very interesting experiments were made by . M. Witt, to ascertain whether soluble matter, s common salt, is in any degree removed from by filtration. Theoretically, it has been ed that this is impossible, since the filter only echanically in stopping suspended particles; e results of Mr Witt's experiments shew that five to fifteen per cent. of the soluble salts separated by sand-filters such as above bed. This is a curious and interesting subject, worthy of further investigation. Another most tant matter, on which a series of accurate iments is required, is to ascertain to what t soluble organic matter may be decomposed ltration, especially by charcoal filters, and to ain how long charcoal and other porous r retains its property of acting on organic r in watery solution. The power of dry char- in decomposing organic matter in a gaseous is well established (see below), and it is ell known that fresh charcoal acts powerfully organic matter in solutions, but the extent to this power is retained in the charcoal of a in continuous action has not been satisfactorily ained. This is of the highest importance, as metimes happens that water of brilliant trans- cy, and most pleasant to drink, on account of rbonic acid it contains, is charged with such ount of poisonous organic matter as to render e as a daily beverage very dangerous. Char- btained from burning bones is still more ious than charcoal from wood. A filter of l charcoal will render London porter colourless. and clay have similar properties. Professor found that putrid urine and sewer-water, passed through clay, dropped from the filter less and inoffensive.

en a liquid contains mucilaginous or other r having viscous properties, there is consider- difficulty in filtering it, as the pores of the m become filled up and made water-tight. l filters are therefore required for syrups, tc. Such liquids as ale, beer, &c., would be lingly difficult to filter, and therefore they are clarified by the processes described under FINING. Oil is usually passed through long bags made of twilled cotton cloth (Canton flannel). These are commonly 4 to 8 feet long, and 12 to 15 inches in diameter, and are enclosed in coarse canvas bags, 8 or 10 inches in diameter, and thus the inner filtering-bag is corrugated or creased, and a large surface in proportion to its size is thus presented. Syrups are filtered on a small scale by confectioners, &c., by passing them through conical flannel bags, and on a large scale in the *creased bag-filter* just described. Thick syrups have to be diluted or clarified with white of egg, to collect the sediment into masses, and then they may be filtered through a coarse cloth strainer. Vegetable juices generally require to be treated in this manner.

The simple laboratory filter has to be modified when strong acid or alkaline solutions, or substances which are decomposed by organic matter, require filtration. Pure silicious sand, a plug of asbestos, pounded glass, or clean charcoal, are used for this purpose. Böttger recommends gun-cotton as a filter for such purposes. He has used it for concentrated nitric acid, fuming sulphuric acid, chromic acid, permanganate of potash, and concentrated solutions of potash and aqua regia. He says that properly prepared gun-cotton is only attacked at ordinary temperatures by acetic ether.

Filtering paper for laboratory purposes requires to be freed from inorganic impurities that are soluble in acids, &c.; this is effected by washing the paper with hydrochloric acid, or, when thick, with nitric and hydrochloric acid, and removing the acid by washing thoroughly with distilled water.

When a considerable quantity of liquid has to pass through a filter, it is sometimes desirable that it should be made to feed itself. In the laboratory, this is done by inverting a flask filled with the liquid over the filtering funnel, the mouth of the flask just touching the surface of the liquid when at the desired height in the funnel. As soon as it sinks below this, air enters the flask, and some liquid falls into the funnel. On a large scale, self-acting filters are fed by the common contrivance of a ball-cock and supply-pipe.

Air Filters.—The extraordinary powers of charcoal in disinfecting the gaseous products evolved from decomposing animal and vegetable matter, have been made available by Dr Stenhouse in constructing an apparatus for purifying air that is made to pass through it. A suitable cage, containing charcoal in small fragments, is fitted to the opening from which the deleterious gases issue, and is found to render them perfectly inodorous, and probably innocuous. The first application of this was made in 1854, when a charcoal air-filter was fitted up in the justice-room of the Mansion House, London, the window of which opens above a large urinal, the smell of which was very offensive in the room. The filter at once destroyed the nuisance, and 'although six years have elapsed, the charcoal has never required to be renewed.' 103 of such filters have been applied to the outlets of the sewers of one district of the city of London, and no bad smell is observable where they are placed, and no obstruction offered to the ventilation of the sewers. They have been applied with like results in two or three county towns. The subject is fully treated by Dr

Stenhouse in a letter to the lord mayor, published by Churchill (London). Charcoal respirators are small air-filters of the same kind applied to the mouth. See RESPIRATOR.

FI'MBRIATED (Lat. *fimbria*, a border or hem), is said, in Heraldry, of an ordinary having a narrow border or edging of another tincture.

FINAL JUDGMENT. The meaning of this term in the law of Scotland having led to some dispute, an Act of Sederunt (q. v.) was passed on the 11th July 1828, declaring it to be applicable to a case in which 'the whole merits of the cause have been disposed of, although no decision has been given as to expenses, or, if expenses have been found due, although they have not been modified or decerned for.' The importance of the definition arises from the fact, that only final judgments can be carried by advocation from the inferior to the superior courts. 'The whole merits of the cause' has been held to mean, not only the merits of the action to which the advocator is a party, but also those of any other conjoined with it. If the parties in the conjoined action will not proceed to have it determined, the advocator ought to apply to the inferior judge, stating his intention to advocate, and praying him to call on the parties to proceed with the conjoined process; and, failing their doing so, to disjoin the causes, which disjunction will render an advocation competent. Shand's *Practice*, i. p. 454. In Advocations (q. v.) and Suspensions (q. v.), if the record be closed, and the proof concluded in the inferior court, the case may be taken at once to the Inner House without a judgment of the Lord Ordinary, 13 and 14 Vict. c. 36. In order to warrant an appeal to the circuit court in a civil cause (where otherwise competent) not only the merits must have been disposed of, but the expenses modified and decerned for.

FINA'LE, the name given to that part of a musical composition which finishes the act of an opera; also to the last movement of an instrumental composition, as in the symphony, quartet, quintet, sonata, &c. The character of the finale, in purely instrumental works, is always lively. In the opera, it depends on the subject, while in some operas the finale consists of an aria alone, as in Mozart's *Figaro*, instead of the usual full concerted music for soli and chorus.

FINA'NCE, a French word incorporated with our language, means the art of managing money matters, the person who professes this art being called a financier. Finance, in the plural, is often used for money itself, but still with a reference to the purpose to which it is to be applied, as where the finances of a country are said to have improved or fallen off—that is to say, have become abundant or scanty according to the expenditure of the country. Sometimes the word is applied to private wealth, but it is properly applicable to public funds. We use it in this country rather in a political and economic sense than officially, but in France there have been, from time to time, comptrollers-general of finance, councils of finance, bureaus of finance, &c. Many statesmen have been spoken of as great financiers, from the talent which they have shewn for adjusting national revenue and expenditure, as Colbert, Turgot, and Necker in France, and Godolphin and Peel in Britain. As a branch of statesmanship, finance is intimately connected with other branches. In questions of national policy —such as, whether a state can go to war or not —the financier is the person who is expected to count the cost, and say how the necessary funds are to be obtained. In the question, whether an unpopular or oppressive tax is to be abolished, the financier is an authority on the question, whether the government can do without it. Hence, there is a special connection between finance and taxation, which has become closer and stronger since the progress of political economy has shewn that the taxes which are the most productive, and even the most easily collected, are not always the best, looking at the gain or loss of a nation, in the long-run. Turgot said that finance was the art of plucking the fowl without making it cry. On this notion, the principle of indirect taxation achieved its popularity. For instance, customs duties seem to fall on no one. The importer and the retailer add them to the price of the article, and the ultimate purchaser only knows that the article is dear without experiencing the sense of hardship felt by one who pays out money directly in the shape of a tax. But many indirect taxes have, on the other hand, been found to affect the trade and the wealth of communities to an extent which has made them very deleterious in comparison with direct taxes. See further on matters connected with finance the heads CUSTOMS; DEBT, NATIONAL; CORN LAWS; EXCISE; FREE TRADE; TAXATION; REVENUE.

FINCH (Ger. *Fink;* for the origin of the word, see CHAFFINCH), the popular name of a great number of species of little birds of the order *Insessores*, and tribe *Conirostres*. Many of them have great powers of song, and are called *Hard-billed Song-birds*, in contradistinction to the Warblers (*Sylviadæ*) or *Soft-billed Song-birds*. The name F. is sometimes used as equivalent to *Fringillidæ* (q. v.), either in its more extensive or more restricted application; but the limits of its popular use are very indeterminate, and some birds are equally known as finches and as linnets, or as grosbeaks, &c. The word F. often forms part of the popular name of birds of this family, as bullfinch, chaffinch, haw-finch, pine-finch, &c.

FINDER OF GOODS. The finder acquires a special property in goods, which is available to him against all the world except the true owner; but before appropriating them to his own use, he must use every means within his power to discover the owner. It has been decided that if the property had not been designedly abandoned, and the finder knew who the owner was, or, with due exertion, could have discovered him, he was guilty of larceny in keeping and appropriating the articles to his own use. Armourie *v.* Delamirie, 1 Str. 505; Merry *v.* Green, 7 M. and W. 623. In the latter case, in which a person purchased, at a public auction, a bureau, in which he afterwards discovered, in a secret drawer, a purse containing money, which he appropriated to his own use, Mr Baron Parke thus laid down the law. 'The old rule, that "if one lose his goods, and another find them, though he convert them *animo furandi* to his own use, it is no larceny," has undergone in more recent times some limitations. One is, that if the finder knows who the owner of the lost chattel is, or if, from any mark upon it, or the circumstances under which it is found, the owner could be reasonably ascertained, then the fraudulent conversion, *animo furandi*, constitutes a larceny. Under this head fall the cases where the finder of a pocket-book with bank-notes in it, with a name on them, converts them *animo furandi;* or a hackney-coachman, who abstracts the contents of a parcel which has been left in his coach by a passenger whom he could easily ascertain; or a tailor, who finds and applies to his own use a pocket-book in a coat sent to him to repair by a customer whom he must know: all these have been held to be cases of larceny; and the present is

e of the same kind, and not distinguish-them' (Pp. 631, 632).

IORN, a river rising on the west side of lh Liadh Mountains, in the east of Inver-

It runs north-east through the counties ess, Nairn, and Elgin, in the valley of n, passes Forres, and enters the Moray ie village of Findhorn by a lagoon three l a half miles in extent, after a course of iles. Its waters abound in salmon and basin consists of gneiss in the upper part, l red sandstone in the lower. At one ose nearly 50 feet in the great floods of 29, known as the 'Moray Floods,' and did age. West of the mouth of the F. are the ds, in one part 118 feet high, and covering of a formerly fertile tract.

OF LANDS, in England, fictitious pro-rmerly in common use in order to transfer real property by a mode more efficacious rdinary conveyance. A fine is defined by ing from Glanville, an amicable composi-nal agreement by leave and licence of the s justiciaries; and such indeed it was in effect, and it was called a fine because it ination (*finis*) to all litigation between the d those claiming through them, in regard ers touching the suit. The proceedings in shortly as follow: The party to whom the o be conveyed commenced a fictitious suit : vendor. But the case was no sooner in the plaintiff asked leave to agree or the defendant. This leave having been covenant was entered into whereby the lefendant, called the *cognizor*, recognised of the plaintiff, called the *cognizee*, to the which he admitted that the plaintiff was kept from the possession. These pro-which at first were real, were afterwards niversally without having a shadow of in fact. This solemn farce having been a *note* of the fine, being an abstract of ant, the names of the parties, and the the land, was entered on the rolls of the l the business was concluded by what was *foot* of the fine, setting forth the parties, nd place of agreement, and before whom as levied. The whole was embodied in commencing *hæc est finalis concordia*. It ary that a fine should be levied openly in of Common Pleas, or before the chief-that court, or before two or more com-appointed in the country. Fines were ds, which need not be specified here. In a fine should have full effect, it required l with *proclamations*, i. e., open proclama-transaction in court. A fine so levied o right even of strangers who failed to r claim during the period allowed by law; estate was said to be barred by fine and

A fine levied by a married woman had of cutting off all right she might have ds, and was the only mode by which a man could convey lands; and in order to r from undue influence, she was privately as to the voluntary nature of the trans-fine levied by tenant in tail cut off the but did not affect remainders; hence, ne was sometimes used to bar an entail, method was by common Recovery (q. v.). a recovery was the most effectual method an entail, it required the consent of the possession. Where, then, that consent be obtained, or where the tenant in tail same time tenant in fee in remainder, a fine was a convenient mode of barring the entail The statute *De Donis* prohibited fines as a means of barring entails, but this restriction was removed by 32 Hen. VIII. c. 36.

The old law as to fines has been abolished by the *Fines and Recoveries Act*, 3 and 4 Will. IV. c. 74 This act was passed for the purpose of abolishing the cumbrous machinery used in the transfer of land according to the ancient forms and fictions. The act abolishes all the fictions formerly in use. In regard to fines and recoveries by heirs of entail, it permits every tenant in tail of freehold land whether in possession, in remainder, or contingency, to dispose of the lands for an estate of fee-simple absolute, or any less estate, by any of the ordinary conveyances, except a will, at common law, or under the statute of Uses (q. v.). The conveyance must be registered in the Court of Chancery within six months after its execution. But where there is an estate of freehold prior to the estate tail, the act requires that the consent of the tenant of the freehold shall be necessary in order to give full effect to the conveyance. This person is called the *protector of the settlement*. Where a conveyance is made without consent of the protector, it has the effect of barring those only who would succeed under the heir by whom it is executed. This is precisely the effect which under the old law belonged to a recovery without the consent of the tenant to the *præcipe*, and of a fine levied by a tenant in tail; so that the statute, while it abolishes the fictions, sustains entails as family settlements to the limited effect which they formerly possessed. In regard to fines by married women, the act provides that a Feme Coverte (q. v.) may dispose by deed of any lands, or of money subject to be invested in the purchase of lands. It is necessary, unless specially dispensed with by the court, that her husband should concur in the conveyance, and that she should acknowledge it before a judge of one of the superior courts at Westminster, or a Master in Chancery, or two of the commissioners appointed for that purpose under the act.

FI'NGAL'S CAVE. See STAFFA.

FINGER-BOARD, that part of a stringed musical instrument, as in the violin, violoncello, guitar, &c., which is made of ebony-wood, and glued on the neck of the instrument, and shaped on the top somewhat round, to suit the position in which the strings lie on the nut and the bridge. At the lower end, the finger-board projects over the sounding-board of all those instruments played with the bow, while in the guitar species the finger-board is glued down on both neck and sounding-board. The strings are stretched along the finger-board from the nut at the top to the bridge at the lower end, and are pressed down by the fingers of the left hand, to make the different notes in music; while the right hand produces the sound either by a bow or the points of the fingers.

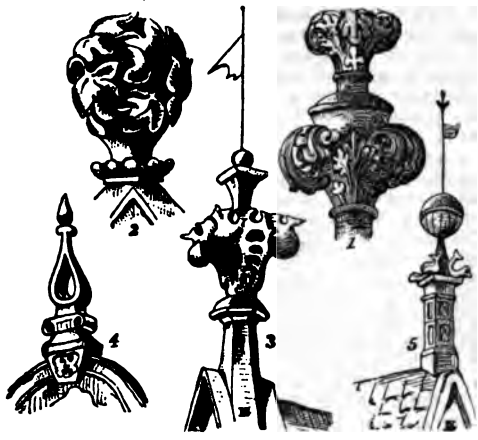
FINGERS. See HAND.

FINGERS-AND-TOES, the popular name of a disease in turnips, called also ANBURY (q. v.).

FI'NIAL, an ornament, generally carved to resemble foliage, which forms the termination of pinnacles, gables, spires, and other portions of Gothic architecture. There are traces of foliated terminations, both in stone and metal, on the pediments of classic buildings (see ACROTERION), but it was not till the 12th c. that the finial proper was introduced. During the latter part of that century and the whole of the 13th c., finials of the most perfect form and of infinite variety were used as the crowning ornaments of every salient point in the buildings of the

pe iod (see fig. 1). The architects of the 14th c., in finials, as in other ornaments, imitated more closely the forms of natural foliage; but their finials had neither the variety of design nor the vigour of outline of those of the preceding century (see fig. 2).

In the 15th and 16th centuries, the finials became more and more meagre in form, and are frequently only four crockets set upon a bare pyramidal terminal. Some variety of effect is often obtained



Finials:

1, from Bishop Bridport's Monument, Salisbury Cathedral; 2, York Minster; 3, Maulbroun, Germany; 4, Crew Hall, Cheshire; 5, Augsburg.

during this period by surmounting the finial with a gilded vane. This is common in Tudor and domestic architecture (fig. 3). Finials were carved both in stone and wood, and in the latter material with great delicacy and minuteness. In connection with metal-work, finials of metal were used, and whatever the material adopted, its natural capabilities were made a source of special beauty.

The finial is one of the most effective ornaments of Gothic architecture, and when that style was succeeded by the revival of classic, in the reign of Queen Elizabeth, our forefathers could not persuade themselves to part with the finials to their buildings. We thus find in Elizabethan architecture a great variety of finials; they are, however, almost entirely of a geometric form, and without foliage (fig. 4), and are frequently, especially when terminating wooden gables, combinations of finial and vane partly wood and partly iron (fig. 5). In the stricter classic which succeeded the Elizabethan, some traces of the favourite finial still remain in the balls, obelisks, &c., used as terminations, and also in the shields and supporters (themselves a remnant of feudalism) which form the crowning ornament of gate-piers, pedestals, &c.

FINING, the process of clearing turbid liquors, such as beer, wine, &c. The simplest mode of fining is by passing the liquor through a porous substance that retains the solids and allows the clear liquid to pass through (see FILTER); but this method is only applicable to particles mechanically suspended in a limpid liquid. When the liquid contains mucilaginous or other matter, that readily clogs the filter, some other means of fining must be used. Such is the case with all malt liquors and most wines when turbid. When in good condition, these do not usually require fining, as the suspended matter agglomerates, and sinks to the bottom shortly after the fermentation is completed. When this does not take place, some means of promoting such action are usually adopted. One of the simplest is to add soluble albumen, such as white of egg, to a portion of the liquid, and after beating it well in this, to add the mixture, and stir it into the whole of the liquid. Upon the application of heat, the albumen coagulates and contracts from its diffusion into a scum, enveloping and drawing together the suspended matter. The scum is then easily removed. This method is adopted for syrups and other liquids that may be heated without mischief. In making clear soups, the albumen of the meat performs this function. As alcohol coagulates albumen, it may be used for fining wines and cordials without the application of heat. It is generally used for red wines. Malt liquors are usually fined by means of gelatine, either isinglass or cheaper substitutes being used. One pound of isinglass is soaked in three or four pints of water, or sour beer, then more sour liquor added as the isinglass swells, until it amounts to about a gallon. The jelly thus formed is next dissolved in seven or eight gallons of the liquor to be fined. This solution, having the consistence of a syrup, is called 'brewers' finings,' and about a pint to a pint and a half is added to a barrel of ale or porter, or to a hogshead of cider or wine. The action of this depends upon the combination of the gelatine with the astringent matter (tannic acid) of the liquor, forming thereby an insoluble solid, which sinks to the bottom, and carries with it, like the coagulating albumen, the suspended matter; but as the flavour of malt liquors partly depends upon the astringents they contain, the fining affects the flavour; the astringents also help to preserve the liquor, and hence their removal is in this respect disadvantageous. Malt liquors thus fined do not 'stand well on draught.' The use of gelatine for fining red wines is objectionable, as in most of these the astringent flavour is an esteemed quality, and therefore albumen is preferred.

Other methods of fining are adopted. Sugar of lead is sometimes added, and afterwards one-half its weight of sulphate of potash dissolved in water. By this means, an insoluble sulphate of lead is precipitated, which in subsiding carries down other matters with it. This is a dangerous process, the salts of lead being poisonous. If properly conducted, the whole of the lead may be precipitated, but a casual mistake in the quantities might cause the death of many people. Ox-blood is used in the same manner as albumen and isinglass. Lime, alum, alcohol, and acids act by coagulating albumen &c., contained in the liquor. Plaster of Paris, clay, and even sand, are sometimes used to carry down the suspended matters. A strip of isinglass or a piece of dried sole-skin is often used for fining coffee, and it acts in the manner above described. Liquors that are unusually difficult to fine are called 'stubborn' by coopers and cellarmen.

FINISTÈRE, or FINISTERRE (Lat. *Finis terræ*, 'Land's End'), a department at the western extremity of France, comprehending a part of the former duchy of Bretagne, has an area of 2648 square miles, and a population of 606,552. It is traversed from east to west by two low but picturesque chains of hills. Its coast is very rugged and broken, its shores bristling with dangerous granite rocks, and fringed with many islands. The soil, one-third of which is occupied by sandy tracts and marshes, is moderately productive; and, owing to the vicinity of the sea, which washes the northern, western, and southern shores of the department, the climate is mild and humid. Corn, hemp, and flax are grown in considerable quantities. In the valleys, smiling meadows everywhere occur. The silver and lead mines of F. are very valuable; those of Poullaouen

nulgoet being about the richest in France. Its pal rivers are the Aulne, the Elorn, and the The first of these is connected by a canal the Blavet, and forms part of the great line mmunication by water from Brest to Nantes. department is divided into the following rrondissements: Quimper, Brest, Châteaulin, x, and Quimperlé. Quimper is the chief

ISTERRE, CAPE, or LAND'S END, is the given to a promontory at the north-western nity of Spain, in lat. 42° 54′ N., and long. 9° 20′ W. It is the *Promontorium Nerium* ancients.

LAND (Fin. *Suomesimaa*, land of lakes and s) is a grand duchy of Russia, lying between d 70° N. lat., and between 21° and 33 E. s about 750 miles from north to south, and average breadth of about 185 miles. Accordthe Russian census of 1851, the population 636,915, which, in accordance with the prerate of increase, would give a population of 1,800,000 for 1862. The area of F. may be ted at about 135,000 square miles, of which one-third is occupied by marshes and lakes. rgest of these sheets of water, independently e Ladoga, which belongs partly to the Russian ce of Olonetz, are Lakes Puruvesi, Payane, and Saima; the last of these, which is 180 miles in length, constitutes a portion of tem of water-communication which has been shed between the central parts of the country e Gulf of Finland. The lakes are especially ous in the south-west of F., where they are all united together by rivers and waterfalls, the central lake of Pyhäjärvi. The surface is -land, from 400 to 600 feet above the level of , with occasional higher elevations. There wever, no mountain-ranges, and hence the re unimportant; but in the north the country rsected by a sandy ridge known as the selkae,' which merges, under the name of the unturit Mountains, into the great Lapponian Alpine chain. The coast-line is generally it to the south it is skirted by numerous islands, separated from the land by narrow ls, difficult of navigation, but well adapted poses of defence against hostile attacks from . The principal geological formations are granite, hard limestone, and slate. The of F. are still very abundant, although they en recklessly cut down in many parts of the r for the sake of their ashes, which are used ulate the soil, whose natural poverty requires unteracted by frequent manuring. Pine and ominate, but birch, beech, oak, &c., thrive in ith parts of the country, where some good -land is to be met with. Since the incorporf F. with Russia, agriculture has declined, ring and cattle-breeding increased in import-The most valuable exports of F. are, however, ducts of its forests, as timber, pitch, potash, d rosin, for although it still yields some he supply is scarcely greater than the home , although, when it belonged to the Swedish F. was regarded as the granary of Sweden ley and rye. Wheat and oats are but little Few fruits ripen except hardy berries; and xtreme north, vegetation is almost limited to and liverworts. F. yields some copper, iron, nd slate, but it produces scarcely any salt, constitutes one of the principal articles of Reindeer, wolves, elks, beavers, and various f game abound; while the numerous lakes, adjacent gulfs, supply the inhabitants with an abundance of salmon, herring, and other fish. The climate is rigorous, and winter, which lasts seven or eight months, is succeeded by a brief spring which passes almost suddenly into a short but hot summer of six or seven weeks, succeeded in its turn by a rainy season, which ushers in the return of cold weather. In the north, the sun is absent during a part of December and January, and almost perpetually above the horizon during the short summer. F. is divided into eight lænes or governments—Nyland, Abo-Biorneborg, Tawastehuus, Wiborg, Kuopio, St Michel, Wasa, Ulealborg, which are included in the three dioceses of Abo, Borgo, and Kuopio, and contain in all 214 parishes. The predominant form of religion is the Lutheran, but the Greek Church has of late years been gaining ground. The courts of law are held at Abo (the ancient capital), Wasa, and Wiborg; and there is one university, which was founded in 1640 at Abo, but removed from thence to the present capital, Helsingfors, in 1829. The highest administrative authority is vested in the imperial senate for F., consisting of 16 members, nominated by the emperor, and presided over by the governor-general of Finland. The army, which numbers 6000 men, has the privilege of serving in distinct corps, without being incorporated in the general forces of the empire. The naval force also forms a distinct squadron, under its own national flag.

The early history of F. is shrouded in obscurity, and little is known of the people before the 12th c., when Eric the Saint, king of Sweden, exasperated by their piratical inroads, undertook a crusade against them, and compelled them, by force of arms, to profess Christianity. The hold which the Swedes then acquired over the country was never wholly lost till 1809, when Sweden secured peace with Russia by the cession of all F. and the island of Aland; before that time, however, the Russians had at various epochs wrested portions of the Finnish territories from the Swedes, while F. had been for centuries the perpetual cause and scene of wars between the two nations. The Swedish language had taken such deep root in F., that the efforts of the Russian government to displace it in favour of the native Finnish have hitherto met with only partial success, and in many parts of the country, the people still openly prefer their old masters. The inhabitants, who call themselves *Suomes*, and are denominated *Tschudes* by the Russians, have, however, no affinity of race with the Swedes, and may be regarded as differing from all other European nations, excepting the Lapps and the Finmarkers, to whom they are very probably allied. See FINNS and FINNISH LITERATURE.—For further information, see Gerschau, *Versuch einer Gesch. Finland* (1821); Rühs, *Finland* (Stockh. 1827); Friis, *Beskrivelse over de norske Finlapper* (1841); Gylden, *Histor. och statis. Anteckning. om Städerna i Finland* (1845); Stockfleth, *Bidrag til Kundsk. om Finnerne i Norge;* Topelius, *Finland framställdt i Teckning* (1860).

FINLAND, GULF OF, the eastern arm of the Baltic Sea, between 22° and 30° E. long., and between 59° and 61 N. lat. Its coasts are entirely Russian territory. It receives the waters of the great lakes Onega and Ladoga. The water of the gulf is not deep, and only very slightly salt. The topography of the Gulf of F., which has been thoroughly elucidated by Struve, forms an interesting part of the great work of the Russian survey of the Baltic.

FINLAY, George, a distinguished historian, was born in Scotland about the commencement of the present century. Circumstances induced him to take

up his residence in Athens, where he has patiently and industriously devoted himself to the study of the later Greek history. The fruits of his labour and researches are contained in his *History of Greece under the Romans*, 146 B.C. *to* 717 A.D. (London, 1843; 2d ed. 1857); *History of Greece from its Conquest by the Crusaders to its Conquest by the Turks, and of the Empire of Trebizond*, 1204—1461 A.D. (London, 1851); *History of the Byzantine and Greek Empires*, 716—1453 A.D. (London, 2 vols., 1853—1854); *History of Greece under the Othoman and Venetian Dominion* (1854); and *History of the Greek Revolution* (Edin. Blackwood and Sons, 1861). F. is not regarded as a philosophical historian, in the highest sense of the term; but he has been earnest and indefatigable in his endeavours to obtain a solid and accurate conception of the times about which he has written, and has thus been enabled to throw a flood of new light on the obscurity of modern Greek history. F. also exhibits a profound knowledge of Greek art, antiquities, and topography.

FINMARK, a province of Norway, and the most northern part of the continent of Europe, lying between 68° 30′ and 71° N. lat., and 17° and 31° E. long., constitutes Norwegian Lapland (q. v.). Area about 24,000 square miles, of which three-fourths are occupied by the continent, the rest belonging to the numerous islands which skirt its north-west shores, and terminate in the North Cape. Innumerable fiords and bays indent the coast. The interior is intersected by a snow-covered range of mountains, reaching an elevation of 4000 feet; the line of perpetual snow being here less than 3000 feet above the level of the sea. Agriculture is impracticable above an elevation of 100 feet; a few berries are the only fruits that ripen; and although barley, potatoes, and a few other vegetables thrive in some parts, fish and game constitute almost the sole food of the inhabitants. In the north, where no trees are to be found, the turf of the marshes affords a good supply of fuel. The thin vegetable mould which covers the stony soil yields grass for the sheep and cows, which graze on the declivities of the rocks skirting the fiords and creeks. The principal source of wealth is the reindeer in the north, and the cod-fisheries in the south. The pop., which does not exceed 50,000, consists principally of Lapps (see LAPLAND), a people of Finnish origin. Hammerfest, the capital of F. (70° 40′ N. lat.), is the most northern town of Europe.

FINNISH LITERATURE. To Elias Lönnrot of Helsingfors belongs the merit of having rescued from utter oblivion some of the numerous sagas and songs which had for ages been recited by the Finnish *Runolainen*, or singers, to the sound of the *kantela*, or harp, and thus transmitted from one generation to another. Although his researches were limited to the district of Karelia, in the government of Kupio, he obtained numerous songs and proverbs, and a complete epos, consisting of 32 parts, each of which contained from 200 to 700 verses. This singular monument of the earlier culture of the people was published by him in 1835, under the title of *Kalewala* (the ancient name of Finland), but it met with little notice till the academy of Dorpat made it the subject of discussion at their meetings in 1840. This publicity soon attracted the attention of foreign philologists, and led to its translation into Russian, Swedish, and German. The learned Finnish scholar, Carsten, the Grimms, and Brockhaus, agree in regarding the *Kalewala* as a pure epic, and characterise it as a composition possessing a thoroughly Oriental appreciation of nature, an almost unparalleled wealth of images and tropes, great flexibility of rhythm, and a copiousness of synonyms not to be met with in any other northern tongue. There is less unanimity in regard to the character of the plot, for while one critic believes that the incidents refer to definite historical epochs, another regards them as purely allegorical. But whatever discrepancy of opinion there may be in this respect, the *Kalewala* is admitted by all who are entitled to form a judgment of its merits, to be one of the most curious monuments of the kind possessed by any European people. The date of its composition must be referred to a period anterior to the introduction of Christianity amongst the Finns in the 14th c., while there is even strong internal evidence, from an identity of the names and traditions of the *Kalewala* with many still current in Esthonia, that the poems very probably belong to an epoch anterior to the immigrations of the Karelians into the districts which they now occupy. The publication of the *Kalewala* has given a powerful impetus to the study of the Finnish language, which the Russian government effectively sustains by encouraging the cultivation and use of their native tongue by the Finlanders. The upper classes still cling to the use of Swedish, but the peasantry and small landed proprietors welcome with avidity every addition to the limited stock of their printed literature. Finnish weekly papers circulate freely among them, and political questions are discussed with an enthusiasm which is never met with among similar classes in Scandinavia or Russia Proper, but which affords additional proof of the diversity of character which distinguishes the Finn from either of the neighbouring nations with which he has been successively incorporated.

The prose literature of Finland is almost exclusively devoted to religious and moral subjects. The Bible was translated into Finnish in 1642, but a part of the Old Testament had been translated a century earlier. Several Finnish poets have acquired a reputation of late years, but their works breathe the same melancholy tone which so strongly characterises the more ancient poems of Finland. Lönnrot has made a collection of about 7000 proverbs (*Suomen kansan Sanalskuja*, 1842), and about 2000 charades (*Suom. kans. arwoituskia*, 1851). See Erman's *Archiv f. d. Kunde v. Russland*. *Tengström i Fosterländskt Alb.* (Helsingf.)

FINNS, geographically, the name of the inhabitants of Finland; but in ethnology, that of a considerable branch of the Ugrian race, dwelling for the most part in Finland, though with some representatives in Sweden and Norway as well. The Ugrians have been classed among the nations said to have a Mongolian origin. Dr Latham places them among the 'Turanian Altaic Mongolidæ,' and divides them into Ugrians of the East, and Ugrians of the West. The Western Ugrians consist of Lapps, Finns, Permians, and other nations or tribes in the north and north-west of Russia, and of the Magyars in Hungary. The Magyars are the most numerous, and next after these come the Finns, comprising about 2,000,000 of individuals. All the other tribes of Western Ugrians do not together comprise so many. The F., in common with the other Ugrians, are of the Mongolian type. A recent traveller, Mr Bayard Taylor, describes them as having 'high cheek-bones, square, strong jaws, full, yet firm lips, low broad foreheads, dark eyes and hair, and a deeper, warmer red on the cheeks than on those of the rosy Swedes. The average height is, perhaps, not quite equal to that of the latter race, but in physical vigour there is no inferiority, and there are among them many men of splendid stature, strength, and proportion.' Other travellers bear similar testimony to the physical appearance of the F. proper, or those of pure Finnish blood; but although these form the

majority, there are many, in the towns especially, who pass for F., while, in reality, they are quite as much entitled to be called Swedes, or even Russians, on account of the frequent intermarriages of the F. with individuals of those two nations. The F., from having been originally a nomadic race, have for many centuries been stationary and civilised. Long before the arrival of the German and Slavic nations in the north of Europe, the Ugrians, or *Ogres* (for the name so common in fiction is really of historic origin), possessed it, and were gradually pushed further north and east by the new invaders. Both F. and Lapps, there is good reason to believe, originally extended much further south than they do at present, occupying, perhaps, the whole of Sweden and Norway. 'The Finns,' says Prichard, 'were, in the time of Tacitus, as savage as the Lapps; but the former, during the succeeding ages, became so far civilised as to exchange a nomadic life for one of agricultural pursuits; while the Lapps have ever continued to be barbarous nomades, as well as the Siberian tribes of the same race—namely, the Woguls and Ostiaks. The Finns, as well as their brethren the Beormahs, or Finns of the White Sea, had probably undergone this change long before the time when they were visited by Otther, the guest of Alfred. When the Finns were conquered by the Swedes, they had long been a settled people, but one of curious, and singular, and isolated character.'

The Finnish *language*, like that of the other Ugrian nations, belongs to the Turanian family of languages, and hence offers some striking points of resemblance to the languages and dialects of the Turks, Tartars, Mongols, Mandshurians, Tungusians, and even Magyars or Hungarians. In Finnish, the nouns are not inflected, but an additional word is required to denote the variations of case, number, and sex. The prepositions and pronouns are suffixed to the words they modify. The verbs have only two tenses, past and present; the future being expressed by adding to the present some word indicating a future action or state of being. Rask considers the Finnish to be the most harmonious of tongues. Many Swedish, and a few Russian words have, of course, become incorporated with the language, in consequence of the social and political relations of the F. with those two countries. The F. of our time are doubtless the same race as the *Fenni* of Tacitus, and the *Phinnoi* of Strabo and Ptolemy, though not occupying the same geographical area. 'The nearest approach to a name at once general and native,' says Dr Latham, 'is Suomelaiset, meaning swamp, morass, or fen people; the term Finn and Finlander being of foreign origin.' With respect to the social habits, morals, and manners of the F., all travellers are unanimous in praising them. They are of a cheerful disposition, affectionate towards each other, and honest and honourable in their dealings with strangers. They are also cleanly in their persons, being much addicted to the use of the vapour-bath, to which circumstance may be attributed the strongly marked difference in physical appearance between them and the stunted Lapps, to whom, in language as well as many other respects, they stand closely related.

FINS (allied to Lat. *pinna* or *penna*, see letter P), organs adapted for swimming or locomotion in water. The limits of the application of the term are rather vague. It is always applied to the locomotive organs of fishes, when they possess special organs of locomotion, as almost all of them do; and equally to those organs (the pectoral and ventral fins) which are homologous to the limbs of other vertebrate animals, and to those (the vertical fins) which may be said to be superadded to them, and to belong to fishes alone; equally also to those which are furnished with rays, having a membrane stretched on them, as is generally the case in all the fins of fishes, and to those which consist, as in some fishes, of a mere fold of the skin, and which, when they exist in fishes, are in reality not very much organs of locomotion. The name fins is given to the locomotive organs of *Cetacea*, but not to those of any other *Mammalia*, even when, as in the case of the hind feet of seals, they approach very nearly to the character of the fins of fishes. Nor is it ever given to the webbed feet of birds. But it is often given to the swimming organs of invertebrate animals, as to the expansions of the mantle which serve this purpose in the *Cephalopoda*, and which are entirely destitute of rays.

FINSBURY, or FEN TOWN, a parliamentary borough of Middlesex, forming the north part of London (q. v.).

FINSCALE. See RUDD.

FINSTERAA'RHORN, the highest peak of the Bernese Alps. See ALPS.

FINSTERWALDE, a small town of Prussia, in the province of Brandenburg, is situated on an affluent of the Black Elster, 40 miles north of Dresden. It has manufactures of cloth and machinery; spinning and weaving are carried on. Pop. 6335.

FIORIN. See BENT GRASS.

FIR, a name often used in a sense co-extensive with the widest sense of the word PINE (q. v.), and therefore so as to include a large portion of the CONIFERÆ (q. v.), or at least the whole of the Linnæan genus *Pinus*. But the name fir is often also used in a more restricted signification, and the trees so designated are those forming the genus *Abies* of some authors, *Abies* and *Picea* of others, which the greater number of botanists have now agreed in separating from *Pinus*. The SCOTCH FIR, however, is a true Pine (*Pinus sylvestris*), and will be described along with its congeners. See PINE.—The genus *Abies* is distinguished from *Pinus* by the flat rounded apex of the scales of its cones, and by leaves not in clusters of definite number. Some botanists include the species of LARCH (q. v.) and CEDAR (q. v.) in the genus *Abies;* but if these be separated, no species with clustered leaves remain in this genus, which then contains only the different kinds of SPRUCE FIR and of SILVER FIR, or species most nearly allied to those which ordinarily bear these names. All of them are evergreen. The Spruce Firs form the genus *Abies* of some authors, distinguished by short solitary leaves, scattered all round the branchlets, and by the scales of the (pendulous) cones being attenuated at the apex, and remaining fixed to the axis of the cone. The Silver Firs form the genus *Picea* of some, distinguished by the deciduous scales of the (erect) cones. It being supposed, however, that the Linnæan names had been given through mistake, and that the common Silver Fir is the true *Abies* of the ancients, and the Norway Spruce their *Picea*, Link has attempted, but without being followed by many, to restore these names to their ancient use, and to denominate the genera accordingly.—The NORWAY SPRUCE (*Abies excelsa* or *Pinus Abies*) is a noble tree, sometimes attaining the height of 180 feet, with long cylindrical pendulous cones, denticulate scales, and scattered, green, crowded, suddenly pointed, almost quadrangular leaves. It is the *Fichte* of the Germans, called also *Rothtanne* or *Schwarztanne*. Like the other kinds both of Spruce and Silver Fir, it exhibits the peculiar character

of the *Coniferæ* more perfectly than many of the true Pines do, in its perfectly erect stem, from which proceed almost whorled horizontal branches.

Common, or Norway Spruce Fir (*Abies excelsa*):
Copied from Selby's *British Forest Trees*.

It is a very beautiful pyramidal tree, and when old, its long branches droop towards the ground. It forms entire forests in the middle and north of Europe and in Asia, chiefly upon elevated ridges, although it prefers moist places. It loves districts of primitive rock. In some places, it is found even within the Arctic Circle. It is not a native of Britain, but has long been very generally planted, although too often it is merely made a nurse for other trees, and is not allowed to attain a considerable age or size. It is of rapid growth, but is believed to live to the age of 400 years. It yields

a, branchlet and cone; *b*, scale, with seeds; *c*, a seed.

the same products as the Scotch Fir, resin, turpentine, tar, and lampblack (see these heads); but more resin than turpentine. The true Spruce Rosin flows spontaneously from the bark. The purest pieces are whitish or pale yellow, are sold under the name of Common Frankincense, and used for ointments and plasters, and when melted yield the common Burgundy Pitch (q. v.). The bark of the spruce is a good and cheap non-conductor of heat: the cones are an excellent substitute for tanners' bark. In Sweden and Norway, the inner bark is made into baskets; and the long and slender roots, split and boiled with alkali and sea-salt, are dried, and twisted into cordage, which is used both for vessels and by farmers. The wood is used for fuel and for house-building; it also supplies masts and spars for ships. It is the White Christiania Deal and Danzig Deal of the market, and is very largely imported into Britain from Norway and the Baltic. It is whiter, lighter, less resinous, and more elastic than the timber of Scotch Fir. The sapwood, whilst still in a gelatinous state, is sweet, and is eaten fresh in Sweden and Lapland; and the inner bark, in times of scarcity, is mixed with a little flour or meal of some kind, and baked into bread. The young shoots, still covered with their bud-scales, are in many parts of Europe used for fumigation. The leaf-buds are also employed medicinally in cases of scurvy, rheumatism, and gout. The pollen is often sold by apothecaries instead of the dust of the Club-moss or *Lycopodium*.—A very superior variety of this fir is known as the Red Norway Spruce. Dwarf varieties are cultivated amongst ornamental shrubs. —The Black Spruce (*Abies nigra*), of which the Red Spruce (sometimes called *A. rubra*) is regarded as a mere variety caused by difference of soil, and the White Spruce (*A. alba*), form great woods in North America. The Black Spruce is found as far north as lat. 65°. Both species are now common in plantations in Britain. Both have quadrangular leaves; those of the Black Spruce are of a dark glaucous green, those of the White Spruce are of a lighter colour. The cones of the Black Spruce are short, ovate-oblong, obtuse, and pendulous, with rounded scales ragged at the edge; those of the White Spruce are oval, and tapering to a point with entire scales. The Black Spruce is a valuable timber tree, supplying yards of ships, &c., but its planks are apt to split. The White Spruce is smaller, and the timber inferior. From the Black Spruce the *Essence of Spruce* is obtained, which is so useful as an antiscorbutic in long voyages, and is used for making spruce-beer. Spruce-beer is also made by adding molasses or maple sugar to a decoction of the young branchlets, and allowing the whole to ferment. From the fibres of the root of the White Spruce, macerated in water, the Canadians prepare the thread with which they sew their birch-bark canoes; and the seams are made water-tight with its resin. —From the twigs of the Oriental Fir (*A. Orientalis*), a native of the Levant, a very fine clear resin exudes, which is known by the name of Sapinds' Tears. This fir has very short quadrangular leaves, densely crowded, and uniformly imbricated.—The Hemlock Spruce of North America (*A. Canadensis*) forms great part of the forests of Canada and of the Northern States of America, extending northwards as far as Hudson's Bay. Its timber is not much esteemed, as it splits very obliquely, and decays rapidly in the atmosphere; but the bark is valued for tanning. The leaves are two-rowed, flat, and obtuse. The cones are scarcely longer than the leaves. The young trees have a very graceful appearance, but the older ones are generally much disfigured by remaining stumps of their lower branches.—*A. dumosa* of Nepal is very much allied to the Hemlock Spruce.—*A. Douglasii* is a noble tree, attaining a height of 250 feet, which forms immense forests in the north-west of America, from lat. 43° to lat. 52°. The bark, when the tree is old, is rugged, and 6—9 inches thick. It abounds in a clear, yellow resin. The timber is heavy, firm, and valuable; the growth very rapid.—*A. Menziesii*, a native of North California, very similar to *A. Douglasii* in general appearance, also produces

timber of excellent quality.—*A. Brunoniana*, a Himalayan species, forms a stately blunt pyramid of 120—150 feet in height, with branches spreading like the cedar, and drooping gracefully on all sides. It is found only at considerable elevations. The wood is not durable, but the bark is very useful.—The KHUTROW or HIMALAYAN SPRUCE (*A. Smithiana*, called also *A. Morinda* and *A. Khutrow*) much resembles the Norway Spruce, but has longer and more pendulous branches. The wood is white, and not highly esteemed, although it readily splits into planks.—The MOUNT ENOS FIR (*A. Cephalonica*), a native of Cephalonia, attaining a height of 60 feet, and a diameter of three feet, yields durable and very valuable timber.—All these species have been introduced into Britain, and some of them seem likely soon to be pretty common in our plantations, as well as others from the north-west of America and from the mountains of Asia, as *A. Wittmanniana*, &c., noble trees, and apparently quite suitable to the climate.—The common SILVER FIR (*Picea pectinata*, or *Abies* or *Pinus picea*) has erect cylindrical cones, 5—6 inches long, and two-rowed leaves, with two white lines upon the under side. It forms considerable woods upon the mountains of Central Europe and of the north of Asia, and attains a height of 150—180 feet, and an age of 300 years. It is not a native of Britain, but large trees are now to be seen in very many places. The wood is white, contains little resin, is very soft and light, and is employed for the ordinary purposes of coopers, turners, and joiners, and in ship and house carpentry, also for making band-boxes and for many fine purposes, especially for the sounding-boards of musical instruments. The same resinous and oily products are obtained from the Silver Fir as from the Spruce and Scotch Fir,

Silver Fir (*Picea pectinata*):
Copied from Selby's *British Forest Trees*.

but of superior quality. It yields the beautiful clear turpentine known as Strasburg Turpentine. Very similar to the Silver Fir, but generally of much smaller size, and indeed seldom much above thirty feet in height, is the BALM OF GILEAD FIR (*Picea or Abies balsamea*), a native of North America from Virginia to Canada. The wood is of little value, but the tree yields CANADA BALSAM (q. v.). Besides these, a number of other species of *Picea* are found in the western parts of North America and in the Himalaya, some of which are trees of great magnitude, and yielding excellent timber, as

Cone of Silver Fir:
a, branchlet and cones; *b*, a scale; *c*, a seed.

P. grandis, a Californian tree of 170—200 feet in height—*P. amabilis*, a species much resembling it—*P. nobilis*, a majestic tree, which forms vast forests on the mountains of Northern California—*P. bracteata*, a Californian species remarkable for its slender stem, which rises to a height of 120 feet, and yet is only about one foot in diameter at the base, and likewise for the manner in which the middle lobe of each bractea of its cones is produced so as to resemble a leaf—*P. Webbiana*, the HIMALAYAN SILVER FIR, which, in its native regions, fills the upper parts of mountain valleys, and crowns summits and ridges at an elevation of upwards of 10,000 feet, a tree of great size, 35 feet in girth, and with a trunk rising 40 feet before it sends out a branch. Most of these have been introduced into Britain with good prospect of their succeeding well in our climate, and other species, as *P. Pichta*, a native of the Altai Mountains, very nearly resembling the Silver Fir, *P. Nordmanniana*, *P. Fraseri*, &c.—*P. religiosa* is a tall and elegant tree, a native of the mountains of Mexico, with slender branches, which are very much used by the Mexicans for adorning churches, and cones shorter than those of any other Silver Fir. *P. Jezoensis* is a new species recently introduced from Japan.

FIRDUSI, FIRDOWSI (TUSI), ABU'L-KASIM MANSUR, the greatest epic poet of Persia, was born between 304—328 H., or 916–940 A.D., at Shadab or Rizvan, near Tus in Khorassan. Whether the name Firdusi (from *firdus*, garden, paradise) was given to him because his father (Fachreddin Ahmad) was a gardener, or on account of the 'Paradise of Poetry' which he had created, is matter of controversy. All that is known of his early life is, that when a boy he was very industrious, and also that 'he loved to sit for days alone on the bank of a river.' At the age of between thirty and forty, he went to Gazneh, where Mahmud the Gaznewide, a great admirer and patron of poetry and the arts generally, then resided. Erelong, F. had an opportunity of displaying both his talent and his extraordinary knowledge of ancient Persian history and legendary lore before the sultan himself, who was so pleased with an episode (the story of Sijavush) written by him at his majesty's order, that he at once paid him a gold dirhem for each couplet, and shortly afterwards sent him a great number of fragmentary ancient chronicles and histories of Persia, that he might versify them, and thus carry out the task once attempted by Dakiki—viz., to write a poetical

history of the Persian kings from the creation of the world to the end of the Sassanide dynasty (636 A.D.)—the reward to be a dirhem a line. F. spent thirty years over the work, and produced the famous *Book of Kings* (*Shah Nameh*), consisting of 60,000 double lines. Without going so far as many critics have gone, we may fairly rank it among the greatest epics of all nations: the *Iliad*, the *Mahabharata*, the *Nibelungen*. Truth and fiction, history and fairy lore, all the most gorgeous imagery of the East and its quaintest conceits, together with the homeliest and most touching descriptions of human joy and human sorrow, of valour and of love, the poet has formed into one glowing song. Though abounding in strict adherence to its sources in impossibilities and anachronisms (such as Alexander the Great being a Christian, Ki-Khosroo holding the Zend Avesta in his hands—some hundred and twenty years before it was brought to light Abraham being Zerdusht, &c.), it yet contains not a little that is of real historical value, quite apart from its being the most faithful mirror of its own times. See SHAH NAMEH. But while F. was 'weaving his poetical carpet,' his enemies had not been idle. Unable to attack his genius and his honesty, they attacked his religious opinions; and the sultan, influenced by bigotry and avarice, sent the poet, instead of 60,000 dirhems of gold, so many dirhems of silver. F. was at a public bath when the messenger arrived with the money, and on discovering that it was silver, and not gold, Mahmud had sent him, he divided the amount into three portions, and gave one to the attendant at the bath, another to the messenger, and the third to a man who brought him a glass of sherbet. He then burned several thousand verses which he had written in praise of the sultan, as sequel to the *Shah Nameh*, and composed one of the bitterest satires against him, which he handed over, well sealed, to the king's favourite slave, to give it to him when he might be seized with one of his fits of despondency, as it contained a beautiful panegyric on him. Dreading the sultan's rage, he fled precipitately, first to Tus; persecuted here, he next went to Baghdad, where Kadir Billah, the calif, received him with all honour. But the unrelenting anger of Mahmud followed him thither, and he removed to Tabaristan, which again he had to leave, to seek another place of refuge. After eleven years of restless wanderings, he was at last allowed to return to his native place, a broken, sick, old man. Mahmud is said to have repented his cruelty at last, and to have sent a caravan loaded with the costliest goods to F., to entreat his forgiveness, and induce him to become once more the star of his court. But while the king's messengers entered one gate of the city, F.'s bier was carried out to his last abode by the other, 1020 A.D. 411 H.C. His only daughter, an only son of his had died long before him at the age of 37 years, refused the sultan's present, and certain buildings were erected instead, in honour of the dead poet.

The great popularity which the *Shah Nameh* has always enjoyed in the East, is to a certain amount also the cause of the uncritical state of the texts. Every transcriber shaped and modified certain passages, or even episodes, according to his own fancy, so that not two out of the innumerable copies are quite alike. Nor are the 60,000 complete extant in any one instance, the utmost number, including all the most palpable interpolations, never exceeding 50,000. The best complete edition of the text, with a glossary and introduction, was published by Turner Macan (Calcutta, 1829, 4 vols.). Another edition, with a French translation, was published by Mohl (Paris, 1840, &c.). Champion published some English extracts in 1788. F. also wrote another poem, *Yusuf and Zuleikha*, which has been edited by Morley, and a *Divan*, or collection of poems. Many European Orientalists have written on F.; among others, Hammer, Wahl, Görres, Schack, Ruckert, Morley, Ouseley, Atkinson, Nassarianz, &c.

FIRE. For the superstitions connected with fire, see BELTEIN, NEED-FIRE, and SUN AND FIRE WORSHIP.

FIRE, in Armorial Bearings, is used to denote those who, being ambitious of honour, perform brave actions with an ardent courage, their thoughts always aspiring as the fire tends upwards. A flame of fire is more frequently used as a charge in France and Germany than in this country; but we have fire-balls or bombs, fire-beacons, firebrands, fire-buckets, &c., in abundance.

FIRE, ORDEAL BY. See ORDEAL.

FIRE, ST ANTHONY'S. See ERYSIPELAS.

FIRE AND SWORD. By the law of Scotland, though decree may be given in a civil action against an absent defender, no criminal sentence can be pronounced unless the accused be present. But to resist a criminal citation, is to rebel against the law of the land, and in former times might be treated as treason. In this view, letters of *fire and sword* were occasionally issued by the privy council (Stair, iv. 89). These letters were directed to the sheriff of the county, authorising him to call in the assistance of the country, and to proceed to the extremities which the terrible words fire and sword indicate, should such proceedings be necessary for apprehending the accused party. Lord Stair describes this remedy as the 'last legal execution, warranting all manner of force of arms that is competent in war.' The same course might be resorted to where the decree of a court was resisted; and the object with which letters of fire and sword were more frequently issued than any other, was to enable the sheriff to dislodge refractory tenants who retained possession contrary to the order of the judge, or the diligence of the law. By the modern practice, the judge may, of course, always call in the aid of the military to apprehend an accused party, or to enforce a decree where the ordinary means have proved unavailing.

FIRE ANNIHILATOR. An apparatus bearing this name was patented by Mr Phillips in 1849, and attracted a good deal of public attention, as it was expected at the time that it would supersede the ordinary Fire Engine (q. v.). The object of the invention was to extinguish fires by pouring into the midst of the conflagration streams of carbonic acid, sulphurous acid, and other gases which do not support combustion. A bottle containing sulphuric acid was placed immediately over a mixture of chlorate of potash and sugar, which, again, was surrounded by a mixture of charcoal, nitre, and gypsum. On breaking the bottle, the sulphuric acid drops upon the chlorate of potash and sugar, which, as is well known to chemists, produces immediately an intense combustion of the sugar; the heat from this fires the surrounding mixture, and dense volumes of the above mentioned gases are evolved. It is said, however, to be practically of little value in ordinary fires, where the air has free access.

FIREARMS may be defined as vessels of whatever form used in the propulsion of shot, shell, or bullets, to a greater or less distance, by the action of gunpowder exploded within them. They have played so great a part in the world's story, that their invention, development, and science deserve careful analysis. At a more advanced period an obvious division of the subject into cannon,

mortars, and small-arms presents itself; but in the infancy of the invention, and amid the obscurity enshrouding it, we can only seek to inquire into the origin of firearms generally.

The invention of gunpowder bears so directly upon the gradual introduction of firearms, that it will be well to consider the two discoveries concurrently. The widely prevalent notion that gunpowder was the *invention* of Friar Bacon, and that cannon were first used by Edward III. of England, must be at once discarded. It is certain that gunpowder differed in no conspicuous degree from the *Greek fire* of the Byzantine emperors, nor from the *terrestrial thunder* of China and India, where it had been known for many centuries before the chivalry of Europe began to fall beneath its levelling power.

'Nitre,' says Sir George Staunton, 'is the natural and daily produce of China and India; and there, accordingly, the knowledge of gunpowder seems to be coeval with that of the most distant historic events.' The earlier Arab historians call saltpetre 'Chinese snow' and 'Chinese salt;' and the most ancient records of China itself shew that, when they were written, fireworks were well known, several hundred years before the Christian era. From these and other circumstances, it is indubitable that gunpowder was used by the Chinese as an explosive compound in pre-historic times; when they first discovered or applied its power as a propellant, is less easily determined. There is an account of a bamboo tube being used, from which the 'impetuous dart' was hurled a distance of 100 feet: this was at a very early period, but it is difficult to say precisely when. It is recorded, however, that in 618 B.C., during the Taing-off dynasty, a cannon was employed, bearing the inscription: 'I hurl death to the traitor, and extermination to the rebel.' This must almost necessarily have been of metal. We have also curious evidence in regard to the armament of the Great Wall; for Captain Parish, who accompanied Lord Macartney's mission, reported that 'the soles of the embrasures were pierced with small holes, similar to those used in Europe for the reception of the swivels of wall-pieces. The holes appear to be part of the original construction of the wall, and it seems difficult to assign to them any other purpose than that of resistance to the recoil of firearms.' If this surmise be correct, the use of jingalls would be carried back to three centuries at least before the Christian era. Stone mortars, throwing missiles of 12 lb. to a distance of 300 paces, are particularly mentioned as having been employed in 757 A.D. by Thang's army; and in 1232 A.D., it is incontestable that the Chinese besieged in Caifong-fou used cannon against their Mongol enemies. Thus, the Chinese must be allowed to have established their claim to an early practical knowledge of gunpowder and its effects.

It seems likely, however, that the principles of firearms reached Europe from India rather than China, and that country has equal, if not superior, claims to the first acquaintance with the art. The ancient Sanscrit writings appear to point very plainly to the operation of some primitive sort of cannon, when, in recording the wars of the Egyptian Hercules in India, it is stated that the sages remained unconcerned spectators of the attack on their stronghold, till an assault was attempted, when they repulsed it with whirlwinds and thunders, hurling destruction on the invaders; and a Greek historian of Alexander's campaign testifies that the Hindûs had the means of discharging flames and missiles on their enemies from a distance.

These Indian philosophers seem, from the writings of Ctesias and Ælian, to have also possessed an unquenchable fire similar to that employed later by the Greeks. Passing from these very early times in which there is reason to believe that some sort of great gun was employed, we come to the comparatively recent date, 1200 A.D., when their use is established beyond a doubt, for Chasêd, the Hindu bard, writes (in stanza 257) that the culivers and cannons made a loud report when they were fired off, and that the noise of the ball was heard at the distance of about ten coss, which is more than three-quarters of a mile. In 1258, the vizir of the king of Delhi went forth to meet the ambassador of Hulaku, the grandson of Genghis Khan, with 3000 carriages of fireworks (in the sense of weapons, probably a sort of rude muskets). In 1368, 300 gun-carriages were captured by Muhammed Shah Bahmiani. The use of cannon had so far advanced in India by 1482, that they were even used for naval purposes; shells having been employed two years earlier by the sovereign of Guzerat. In 1500, the Portuguese had matchlockmen to contend with, as well as heavy ordnance. Pigafetta, in 1511, found the town of Borneo defended by 62 pieces of cannon mounted on the walls. So much for the antiquity, and apparently common use of firearms in China and India, at times long antecedent to any knowledge of them in Europe, and during the period at which they were scarcely developed in an effectual degree. Most of the pieces discovered in India, and supposed to be of early manufacture, are composed of parallel iron bars welded together, and very often they had a movable breech-piece.

The knowledge of gunpowder and firearms may be presumed to have extended in a westerly direction through the Arabs, whom we find using them possibly in 711 A.D., under the name of *manjaniks*, and certainly very early in the 14th century. The Byzantine emperor, Leo, introduced 'fire-tubes' between 890 and 911, for use in connection with Greek fire; and there can be little doubt that these were a species of cannon, probably of small bore. In Spain, both Moors and Christians used artillery as early as the 12th century.

Friar Bacon was conspicuous among his contemporaries for his general learning, and we have no evidence to shew whether he discovered the ingredients of gunpowder independently of foreign aid, or whether he derived the knowledge from some ancient manuscripts; the latter, however, seems the more likely conclusion, as Sir F. Palgrave brought to light in the Bodleian Library a letter from a Spanish friar, Brother Ferrarius, who was a contemporary of Bacon, in which the materials of Greek fire are detailed, differing only in proportions, and in these but slightly, from real gunpowder. That the latter was identified of old with Greek fire, is shewn by the name 'Crake,' applied to the first cannon used. This word, which still survives in 'cracker,' is pointed out by Sir F. Palgrave to be nothing more than a Norman corruption of 'Grec.' Bacon's announcement dates from 1216; but the powder of his time, as made in the West, was not readily explosive, since the materials were but roughly cleared of impurities, and then mixed together on a slab; and probably little use could be made of it as a propellant until the process of granulating had been introduced by Bertholdus Schwartz in 1320. Immediately after this discovery, cannon of small size appeared in the armoury of almost every state, as if their use had been known previously, although no practical effect had been given to the knowledge, on account of the badness of the powder manufactured. These cannon generally consisted of a smaller barrel or chamber to receive the charge, which fitted into a larger

one containing the projectile (see fig. 1). It may be safely assumed that these weapons, if terrifying from their noise, were tolerably harmless—at least to the enemy—in their practice. In 1326, the Florentine republic ordered the making of iron shot and cannon for the defence of its villages. In 1327, Edward III. used 'crakeys of war' against the Scotch; in 1339, ten cannons were employed in the siege of Cambray. By 1346, various improvements had been made; and we find in the same year the consuls of Bruges witnessing experiments by one Peter, a tinman, who had constructed a cannon with a square bore, to throw a cubical shot of about eleven pounds; his bolt passed both walls of the town, and unfortunately killed a man on the other side. We have the authority of Villani for believing that Edward III. had three cannon at Crécy; but the cannon then made were, from the little knowledge of casting, limited to about the size of modern duck-guns, and, as has been remarked, three very inferior muskets could have had but little to do with putting 50,000 men to flight.

Fig. 1.
From the Sarum Manuscripts.

Up to this time, European ordnance had been kept back by the rarity and high prices of sulphur, saltpetre, and iron, the last having been so scarce in England, that it was thought necessary to forbid its exportation by a statute of 28 Edw. III. Still, crude as was their form, and small their number, firearms had established a firm footing in Christendom; their mission of civilisation, and, paradoxical as it may appear, of humanity, had begun. With the first killing discharge, the doom of feudalism had gone forth. Plated armour no longer availed against the weapon of the peasant; and the mailed chivalry, the sinews of previous battles, who had trampled with their iron heels upon popular rights, no longer could carry all before them, but, like other soldiers, were now as loath to be slain by unseen foes as the veriest villein in the host. The people discovered their powers of contending with the noblesse; by degrees, they rose for liberty, and suppressed the tyrannies of the petty lords who had long held them as mere bondsmen. In war, again, as artillery became more general, so the slaughter of battles diminished, for an army outmanœuvred was an army at the enemy's mercy, and therefore beaten; whereas, previously, in the hand to hand fights where victors and vanquished mixed pell-mell in single combat, a victory could only be really won when there were no foes left to slay. A battle as great as that at Crecy might now be gained with a loss to the vanquished of not more than 1000 men, instead of the 30,000 who are said to have fallen victims to the English sword or bow.

Dating from the reign of Edward III., the employment of cannon and bombards in siege operations became more or less general. Froissart records that the Black Prince took bombards, cannon, and Greek fire to the reduction of the castle of Romozantin in 1356, but it does not appear that he availed himself of firearms at the battle of Poitiers in the same year. The bombards seem to have been short, capacious vessels, from which stone balls were shot with small charges to a short distance, and at considerable elevation; they were essentially the parents of the present howitzer or mortars (see fig. 2). The cannon *ounes*, a recent on the other hand, were, for some time at least, of extremely small bore, scarcely larger than muskets of the 15th c.; they discharged leaden bullets, and would have probably been used as hand-weapons, but for their cumbrous and workmanship, which necessitated small car Arms of this description are doubtless

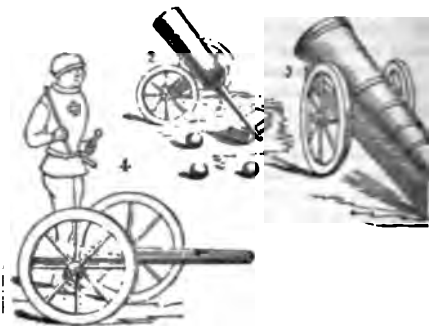

Fig. 2, from the *Chroniques de St Denis*, Four Century. Fig. 3, Bombard of the Fifteenth C from Froissart. Fig. 4, Cannon of the Fif Century, from *Les Vigiles de Charles VII.*

referred to as having been brought by Richa to the siege of St Malo, to the number pieces, where they are said to have kept incessant fire day and night on the town s success.

In the 15th c., armies for siege operations usually accompanied by great and small gun latter being intended to keep down the fire besieged while the large bombards were being l an operation requiring no small time. These were gradually improved, but it was not un reign of Henry VIII. that the founders succ in casting iron ordnance, to the entire exc thenceforward, of cannon formed of squa rounded bars welded together. England has then become famous for the workmanship ordnance. The accompanying sketch fig. 5 of found in the wreck of the *Mary Rose*, which s

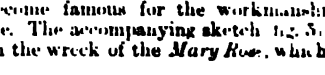

Fig. 5.

Spithead in the above king's reign, will show degree of excellence had been attained in the facture of artillery, little inferior to that wh lasted till our own day, when rifled ordnan rapidly superseding cannon of smooth bore so late as Henry's reign, although great gun found very serviceable in siege and naval tions, where the deteriness of these days offer a trifling resistance to their power, they app have been looked upon rather as an encum than an advantage with armies in the field. is attributed partly to the heavy character guns themselves, and especially of their car but more particularly to the badness, or absence, of the necessary roads for their tra In 1522, it is recorded in the state papers th 'kinges ordonaunce [were] unable to pass over More towards Carlile.'

As time passed on, the details of the mate were improved, the general principles rem the same; the size of the guns increased, wi proportionate weight of the carriages, limbers (q.v.) were added, and the sights gradually perfected and lightened. With in calibre, to which augmented range was added, the number of cannon at one perfo mous taken with an army was by degrees re

A gun is a frustrum of a right cone, with a cylinder (bore) removed around the axis; from which it follows that the thickness of metal is greatest at the breech, where it has to withstand the effect of ignited powder in its most condensed, and therefore most powerful state. Guns are first cast in loam or dry sand, then turned to the required shape, and lastly bored with the minutest accuracy. Formerly, they were cast with the bore already formed; but the direction was rarely exactly correct, and the surface scarcely ever strictly even. Some additional particulars of their manufacture will be given under GUN-FACTORIES, ROYAL; and the science of artillery will be summarised under GUNNERY.

An article on firearms would be incomplete without some allusion to the progress made in small-arms. In the 15th c., the smallest sort of cannon were probably at times mounted and used as hand-guns. From this the step to the arquebus was rapid; that weapon developed as years passed into the clumsy matchlock; that into the firelock and flint-musket; then the percussion-musket; and lastly, into the beautiful rifles of our own day. For diminutives, small arquebuses were made to do duty as horse-pistols; genuine pistols succeeded them; these were gradually improved and reduced in size, till they have culminated in the saloon pistol, available for a waistcoat-pocket; and the deadly revolver, which quadruples a man's defensive power. All these weapons are described under their respective heads—ARQUEBUS, MATCHLOCK, MUSKET, PISTOL, REVOLVER, RIFLE.

Many valuable works have been written on firearms from the days of Leonardo da Vinci and Tartaglia to the present. Among those consulted for this article have been *Etudes sur le Passé et l'Avenir de l'Artillerie* of the Emperor Napoleon III.; *Our Engines of War*, by Captain Jervis; Major Straith's *Treatise on Artillery;* General Chesney *On Firearms*, &c.

FIREARMS, PROVING OF (in Law). In consequence of the frequency of accidents from the bursting of insufficient barrels, the legislature has interfered, not to regulate their manufacture directly, but to prevent all persons from using or selling them until they have been regularly proved in a public proof-house. The first act for this purpose, which was passed in 1813, was soon after superseded by the fuller and more complete one (55 Geo. III. c. 59). By this statute, a fine of £20 is imposed on any person using, in any of the progressive stages of its manufacture, any barrel not duly proved; or any person delivering the same, except through a proof-house; and on any person receiving, for the purpose of making guns, any barrels which have not passed through a proof-house. These penalties are to be levied on conviction before two justices, and the like penalties on persons counterfeiting the proof-marks. The statute does not extend to Scotland or to Ireland, and arms manufactured for Her Majesty, are exempted from its operation. By 10 Geo. IV. c. 38, repealing 6 Geo. IV., the malicious and unlawful use of firearms in Scotland is punishable. See GAME LAWS.

FIREBALLS are projectiles occasionally discharged from guns or mortars, for the purpose either of setting fire to, or of merely illuminating some work, against which hostile operations are directed. The usual ingredients are—mealed powder, 2; saltpetre, 1½; sulphur, 1; rosin, 1; turpentine, 2½; with pitch, tow, naphtha, &c., as circumstances dictate. The use of fireballs has, however, been in great measure superseded by the introduction of rockets (q. v.),

and incendiary shells (q. v.). Akin to the fireball, was the *fire-arrow* of ancient warfare, which consisted of tow steeped in pitch, rosin, or some inflammable mixture, wrapped round the shaft, and fired alight among an enemy's works or troops. Greek fire was also discharged in many cases on large arrows surrounded by tow and shot from *baliste*.

FIREBOTE, the right of a tenant for life or years, according to English law, to cut wood on the estate for the purpose of fuel. See ESTOVER.

FIREBRICK. See BRICK.

FIRECLAY is the variety of clay which is employed in the construction of gas-retorts, glass-pots, firebricks, crucibles, &c., which require to withstand high temperatures. It is found chiefly in the coal measures; and the more famous kind is the Stonebridge, which is found in a bed about four feet thick. It also occurs largely near Glasgow, Newcastle-on-Tyne, and in Belgium and France. The principal constituents of fireclay are silica and alumina, accompanied by small proportions of iron, lime, magnesia, water, and organic matter, as may be observed from the following table:

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.
Silica,	64·10	51·10	48·55	69·25	83·29
Alumina,	23·15	31·35	30·25	17·90	8·10
Oxide of Iron,	1·85	4·63	4·06	2·27	1·88
Lime,	...	1·46	1·66	1·30	
Magnesia,	0·95	1·54	1·91		2·99
Organic Matter and Water,	10·00	10·47	10·67	7·80	3·64

Fireclay is found abundantly, near and at the surface of the ground, and is readily reduced to powder by travelling wheels. When kneaded with water, and fashioned into vessels and other articles, it is dried, and is then generally subjected to a strong heat, which drives off the water and organic matter, causes the silica to unite more firmly with the alumina, &c., and leaves a more or less porous material, which can withstand very high temperatures. The Passau crucibles are merely dried, and are not fired like Hessian crucibles and other fireclay wares. The larger the percentage of silica (sand) in the clay, the more refractory are the articles fashioned from it; and hence sand is often added to clay to increase its fusing-point and refractory powers; but a certain proportion of alumina, &c., is required to serve as a flux, to cement and hold together the particles of sand. The proportions of sand and clay are determined by the temperature to which the manufactured article is intended to be exposed, and the fireclay of crucibles or bricks, which are serviceable at a comparatively low temperature, as in the lining of limekilns, would become soft, and yield in glass or porcelain furnaces.

FIREDAMP is the miners' term applied to light carburetted hydrogen or coal gas when it issues from crevices in coal mines. See GAS.

FIRE-EATING, a name usually given to a variety of feats performed by jugglers with flaming substances, melted lead, red hot metal, &c. Evelyn, writing under date October 8, 1672, thus describes fire-eating in his day: 'I took leave of my Lady Sunderland. She made me stay dinner at Leicester House, and afterwards sent for Richardson, the famous fire-eater. He devoured brimstone on glowing coals before us, chewing and swallowing them, he melted a beer glass, and eat it quite up: then taking a live coal on his tongue, he put on it a raw oyster; the coal was blown on with bellows till it flamed and sparkled in his mouth, and so remained till the oyster gaped, and was quite broiled; then he pitch and wax with sulphur, which he drank as it flamed; I saw it flaming in his m good while; he also took up a thick piece such as laundresses use to put in their smo boxes, when it was fiery hot, held it betwe teeth, then in his hand, and threw it about stone; then he stood on a small pot, and b his body, took a glowing iron with his from between his feet, without touchin pot or ground with his hands; with divers prodigious feats.' About 1818, Signora Jos Girardelli, who described herself as the 'o Salamander,' performed astonishing feats kind in London and other places in E According to the accounts of her, 'She com her performances by passing plates of red-h over her legs; she then stands with her feet on a plate of red-hot iron, and afterwards dra same plate over her hair and across her t &c. About the same time appeared in Pa Chaubert, whose astonishing powers of re heat attracted the attention of the National tute. Among other things performed by this was his going into a common baker's oven, leg of mutton in his hands, and remaining the oven closed until the mutton was com dressed. Another of his performances was st in a flaming tar-barrel until the whole of consumed around him. He subsequently ex in London.

Many of the feats of this kind are undou mere tricks, or illusions, produced by slei hand; others are capable of scientific expla There is nothing more wonderful in stuffing tow into the mouth—a common form of mou fire-eating than in eating flaming plum-pu or in dipping the finger into spirits and let burn like a candle. It is also well known th tongue, or the hand dipped in water, may be with impunity against a white-hot bar of ir layer of vapour developed between the hot and the skin prevents contact and produces see SPHEROIDAL STATE OF LIQUIDS. Suc formances as those of M. Chaubert are explai the well-known power of the living body to m its normal temperature, for a time, in despite the external temperature: see ANIMAL HEAT.

FIRE-ENGINE, a machine employed for ing a jet of water for the purpose of extingu fires. This name was formerly applied t steam-engine. Machines for the extinguish fires have been used from a very early date. were employed by the Romans, and are refe by Pliny, but he gives no account of their co tion. Apollodorus, architect to the Emperor speaks of leathern bags, with pipes attache which water was projected by squeezing th Hero of Alexandria, in his Treatise on Pneu written probably about 150 years before Christian era proposition 27, describes a m which he calls 'the siphons used in conflag It consisted of two cylinders and pistons con by a reciprocating beam, which raises and the pistons alternately, and thus, with the valves opening only towards the jet, proje water from it, but not in a continuous stre the pressure ceases at each alternation of stro

The accompanying copy of Hero's d explains itself. Little or nothing is known the extent to which engines of this kind wer tically used. We have accounts of 'instrum fires' and 'water syringes useful for fires,' bumbing accounts of the city of Augsburg, 151 in 1657. Caspar Schott describes a fire-engi in Nuremberg, which must have been

nistory of the Persian kings from the creation of the world to the end of the Sassanide dynasty (636 A. D.)—the reward to be a dirhem a line. F. spent thirty years over the work, and produced the famous *Book of Kings* (*Shah Nameh*), consisting of 60,000 double lines. Without going so far as many critics have gone, we may fairly rank it among the greatest epics of all nations: the *Iliad*, the *Mahabhârata*, the *Nibelungen*. Truth and fiction, history and fairy lore, all the most gorgeous imagery of the East and its quaintest conceits, together with the homeliest and most touching descriptions of human joy and human sorrow, of valour and of love, the poet has formed into one glowing song. Though abounding—in strict adherence to its sources—in impossibilities and anachronisms (such as Alexander the Great being a Christian, Ki-Khosroo holding the Zend Avesta in his hands—some hundred and twenty years before it was brought to light—Abraham being Zerdusht, &c.), it yet contains not a little that is of real historical value, quite apart from its being the most faithful mirror of its own times. See SHAH NAMEH. But while F. was 'weaving his poetical carpet,' his enemies had not been idle. Unable to attack his genius and his honesty, they attacked his religious opinions; and the sultan, influenced by bigotry and avarice, sent the poet, instead of 60,000 dirhems of gold, so many dirhems of silver. F. was at a public bath when the messenger arrived with the money, and on discovering that it was silver, and not gold, Mahmud had sent him, he divided the amount into three portions, and gave one to the attendant at the bath, another to the messenger, and the third to a man who brought him a glass of sherbet. He then burned several thousand verses which he had written in praise of the sultan, as sequel to the *Shah Nameh*, and composed one of the bitterest satires against him, which he handed over, well sealed, to the king's favourite slave, to give it to him when he might be seized with one of his fits of despondency, as it contained a beautiful panegyric on him. Dreading the sultan's rage, he fled precipitately, first to Tus; persecuted here, he next went to Bagdad, where Kadir Billah, the calif, received him with all honour. But the unrelenting anger of Mahmud followed him thither, and he removed to Tabaristan, which again he had to leave, to seek another place of refuge. After eleven years of restless wanderings, he was at last allowed to return to his native place, a broken, wretched old man. Mahmud is said to have repented his cruelty at last, and to have sent a caravan loaded with the costliest goods to F., to entreat his forgiveness, and induce him to become once more the star of his court. But while the king's messengers entered one gate of the city, F.'s bier was carried out to his last abode by the other, 1020 A. D. (411 H.). His only daughter—an only son of his had died long before him at the age of 37 years—refused the sultan's present, and certain buildings were erected instead, in honour of the dead poet.

The great popularity which the *Shah Nameh* has always enjoyed in the East, is to a certain amount also the cause of the uncritical state of the texts. Every transcriber shaped and moulded certain passages, or even episodes, according to his own fancy, so that not two out of the innumerable copies are quite alike. Nor are the 60,000 couplets extant in any one instance, the utmost number, including all the most palpable interpolations, never exceeding 56,600. The first complete edition of the text, with a glossary and introduction, was published by Turner Macan (Calcutta, 1829, 4 vols.). Another edition, with a French translation, was published by Mohl (Paris, 1840, &c.). Champion published some English extracts in 1788. F. also wrote another poem, *Yusuf and Zuleikha*, which has been edited by Morley, and a *Divan*, or collection of poems. Many European Orientalists have written on F.; among others, Hammer, Wahl, Görres, Schack, Rückert, Morley, Ouseley, Atkinson, Nasarianz, &c.

FIRE. For the superstitions connected with fire, see BELTEIN, NEED-FIRE, and SUN AND FIRE WORSHIP.

FIRE, in Armorial Bearings, is used to denote those who, being ambitious of honour, perform brave actions with an ardent courage, their thoughts always aspiring as the fire tends upwards. A flame of fire is more frequently used as a charge in France and Germany than in this country; but we have fire-balls or bombs, fire-beacons, firebrands, fire-buckets, &c., in abundance.

FIRE, ORDEAL BY. See ORDEAL.

FIRE, ST ANTHONY'S. See ERYSIPELAS.

FIRE AND SWORD. By the law of Scotland, though decree may be given in a civil action against an absent defender, no criminal sentence can be pronounced unless the accused be present. But to resist a criminal citation, is to rebel against the law of the land, and in former times might be treated as treason. In this view, letters of *fire and sword* were occasionally issued by the privy council (Stair, iv. 89). These letters were directed to the sheriff of the county, authorising him to call in the assistance of the country, and to proceed to the extremities which the terrible words fire and sword indicate, should such proceedings be necessary for apprehending the accused party. Lord Stair describes this remedy as the 'last legal execution, warranting all manner of force of arms that is competent in war.' The same course might be resorted to where the decree of a court was resisted; and the object with which letters of fire and sword were more frequently issued than any other, was to enable the sheriff to dislodge refractory tenants who retained possession contrary to the order of the judge, or the diligence of the law. By the modern practice, the judge may, of course, always call in the aid of the military to apprehend an accused party, or to enforce a decree where the ordinary means have proved unavailing.

FIRE ANNI'HILATOR. An apparatus bearing this name was patented by Mr Phillips in 1849, and attracted a good deal of public attention, as it was expected at the time that it would supersede the ordinary Fire Engine (q. v.). The object of this invention was to extinguish fires by pouring into the midst of the conflagration streams of carbonic acid, sulphurous acid, and other gases which do not support combustion. A bottle containing sulphuric acid was placed immediately over a mixture of chlorate of potash and sugar, which, again, was surrounded by a mixture of charcoal, nitre, and gypsum. On breaking the bottle, the sulphuric acid drops upon the chlorate of potash and sugar, which, as is well known to chemists, produces immediately an intense combustion of the sugar; the heat from this fires the surrounding mixture, and dense volumes of the above-mentioned gases are evolved. It is found, however, to be practically of little value in ordinary fires, where the air has free access.

FIREARMS may be defined as vessels—of whatever form—used in the propulsion of shot, shell, or bullets, to a greater or less distance, by the action of gunpowder exploded within them. They have played so great a part in the world's story, that their invention, development, and science deserve careful analysis. At a more advanced period, an obvious division of the subject into cannon,

nature, and small-a us presents itself; but in the infancy of the inve n, and amid the obscurity enshrouding it, we c only seek to inquire into the origin of firearms ge..erally.

The invention of gunpowder bears so directly upon the gradual introduction of firearms, that it will be well to consider the two discoveries concurrently. The widely prevalent notion that gunpowder was the *invention* of Friar Bacon, and that cannon were first used by Edward III. of England, must be at once discarded. It is certain that gunpowder differed in no conspicuous degree from the *Greek fire* of the Byzantine emperors, nor from the *terrestrial thunder* of China and India, where it had been known for many centuries before the chivalry of Europe began to fall beneath its levelling power.

'Nitre,' says Sir George Staunton, 'is the natural and daily produce of China and India; and there, accordingly, the knowledge of gunpowder seems to be coeval with that of the most distant historic events.' The earlier Arab historians call saltpetre 'Chinese snow' and 'Chinese salt;' and the most ancient records of China itself shew that, when they were written, fireworks were well known, several hundred years before the Christian era. From these and other circumstances, it is indubitable that gunpowder was used by the Chinese as an explosive compound in pre-historic times; when they first discovered or applied its power as a propellant, is less easily determined. There is an account of a bamboo tube being used, from which the 'impetuous dart' was hurled a distance of 100 feet: this was at a very early period, but it is difficult to say precisely when. It is recorded, however, that in 618 B.C., during the Taing-off dynasty, a cannon was employed, bearing the inscription: 'I hurl death to the traitor, and extermination to the rebel.' This must almost necessarily have been of metal. We have also curious evidence in regard to the armament of the Great Wall; for Captain Parish, who accompanied Lord Macartney's mission, reported that 'the soles of the embrasures were pierced with small holes, similar to those used in Europe for the reception of the swivels of wall-pieces. The holes appear to be part of the original construction of the wall, and it seems difficult to assign to them any other purpose than that of resistance to the recoil of firearms.' If this surmise be correct, the use of jingalls would be carried back to three centuries at least before the Christian era. Stone mortars, throwing missiles of 12 lb. to a distance of 300 paces, are particularly mentioned as having been employed in 757 A.D. by Thang's army; and in 1232 A.D., it is incontestable that the Chinese besieged in Calfong-fou used cannon against their Mongol enemies. Thus, the Chinese must be allowed to have established their claim to an early practical knowledge of gunpowder and its effects.

It seems likely, however, that the principles of firearms reached Europe from India rather than China, and that country has equal, if not superior, claims to the first acquaintance with the art. The ancient Sanscrit writings appear to point very plainly to the operation of some primitive sort of cannon, when, in recording the wars of the Egyptian Hercules in India, it is stated that the sages remained unconcerned spectators of the attack on their stronghold, till an assault was attempted, when they repulsed it with whirlwinds and thunders, hurling destruction on the invaders; and a Greek historian of Alexander's campaign testifies that the Hindûs had the means of discharging flames and missiles on their enemies from a distance.

These Indian philosophers seem, from the writings of Ctesias and Ælian, to have also possessed an unquenchable fire similar to that employed later by the Greeks. Passing from these very early times in which there is reason to believe that some sort of great gun was employed, we come to the comparatively recent date, 1200 A.D., when their use is established beyond a doubt, for Chasêd, the Hindu bard, writes (in stanza 257) that the culivers and cannons made a loud report when they were fired off, and that the noise of the ball was heard at the distance of about ten coss, which is more than three-quarters of a mile. In 1258, the vizir of the king of Delhi went forth to meet the ambassador of Hulaku, the grandson of Genghis Khan, with 3000 carriages of fireworks (in the sense of weapons, probably a sort of rude muskets). In 1368, 300 gun-carriages were captured by Muhammed Shah Bahmiani. The use of cannon had so far advanced in India by 1482, that they were even used for naval purposes; shells having been employed two years earlier by the sovereign of Guzerat. In 1500, the Portuguese had matchlockmen to contend with, as well as heavy ordnance. Pigafetta, in 1511, found the town of Borneo defended by 62 pieces of cannon mounted on the walls. So much for the antiquity, and apparently common use of firearms in China and India, at times long antecedent to any knowledge of them in Europe, and during the period at which they were scarcely developed in an effectual degree. Most of the pieces discovered in India, and supposed to be of early manufacture, are composed of parallel iron bars welded together, and very often they had a movable breech-piece.

The knowledge of gunpowder and firearms may be presumed to have extended in a westerly direction through the Arabs, whom we find using them possibly in 711 A.D., under the name of *manjaniks*, and certainly very early in the 14th century. The Byzantine emperor, Leo, introduced 'fire-tubes' between 890 and 911, for use in connection with Greek fire; and there can be little doubt that these were a species of cannon, probably of small bore. In Spain, both Moors and Christians used artillery as early as the 12th century.

Friar Bacon was conspicuous among his contemporaries for his general learning, and we have no evidence to shew whether he discovered the ingredients of gunpowder independently of foreign aid, or whether he derived the knowledge from some ancient manuscripts; the latter, however, seems the more likely conclusion, as Sir F. Palgrave brought to light in the Bodleian Library a letter from a Spanish friar, Brother Ferrarius, who was a contemporary of Bacon, in which the materials of Greek fire are detailed, differing only in proportions, and in these but slightly, from real gunpowder. That the latter was identified of old with Greek fire, is shewn by the name 'Crake,' applied to the first cannon used. This word, which still survives in 'cracker,' is pointed out by Sir F. Palgrave to be nothing more than a Norman corruption of 'Grec.' Bacon's announcement dates from 1216; but the powder of his time, as made in the West, was not readily explosive, since the materials were but roughly cleared of impurities, and then mixed together on a slab; and probably little use could be made of it as a propellant until the process of granulating had been introduced by Bertholdus Schwartz in 1320. Immediately after this discovery, cannon of small size appeared in the armoury of almost every state, as if their use had been known previously, although no practical effect had been given to the knowledge, on account of the badness of the powder manufactured. These cannon generally consisted of a smaller barrel or chamber to receive the charge, which fitted into a larger

one containing the projectile (see fig. 1). It may be safely assumed that these weapons, if terrifying from their noise, were tolerably harmless—at least to the enemy—in their practice. In 1326, the Florentine republic ordered the making of iron shot and cannon for the defence of its villages. In 1327, Edward III. used 'crakeys of war' against the Scotch; in 1339, ten cannons were employed in the siege of Cambray. By 1346, various improvements had been made; and we find in the same year the consuls of Bruges witnessing experiments by one Peter, a tinman, who had constructed a cannon with a square bore, to throw a cubical shot of about eleven pounds; his bolt passed both walls of the town, and unfortunately killed a man on the other side. We have the authority of Villani for believing that Edward III. had three cannon at Crécy; but the cannon then made were, from the little knowledge of casting, limited to about the size of modern duck-guns, and, as has been remarked, three very inferior muskets could have had but little to do with putting 50,000 men to flight.

Fig. 1.
From the Santini Manuscripts.

Up to this time, European ordnance had been kept back by the rarity and high prices of sulphur, saltpetre, and iron, the last having been so scarce in England, that it was thought necessary to forbid its exportation by a statute of 28 Edw. III. Still, crude as was their form, and small their number, firearms had established a firm footing in Christendom; their mission of civilisation, and, paradoxical as it may appear, of humanity, had begun. With the first killing discharge, the doom of feudalism had gone forth. Plated armour no longer availed against the weapon of the peasant; and the mailed chivalry, the sinews of previous battles, who had trampled with their iron heels upon popular rights, no longer could carry all before them, but, like other soldiers, were now as loath to be slain by unseen foes as the veriest villein in the host. The people discovered their powers of contending with the noblesse; by degrees, they rose for liberty, and suppressed the tyrannies of the petty lords who had long held them as mere bondsmen. In war, again, as artillery became more general, so the slaughter of battles diminished, for an army outmanœuvred was an army at the enemy's mercy, and therefore beaten; whereas, previously, in the hand-to-hand fights where victors and vanquished mixed pell-mell in single combat, a victory could only be really won when there were no foes left to slay. A battle as great as that at Crécy might now be gained with a loss to the vanquished of not more than 1000 men, instead of the 30,000 who are said to have fallen victims to the English sword or bow.

Dating from the reign of Edward III., the employment of cannon and bombards in siege operations became more or less general. Froissart records that the Black Prince took bombards, cannon, and Greek fire to the reduction of the castle of Romozantin in 1356, but it does not appear that he availed himself of firearms at the battle of Poitiers in the same year. The bombards seem to have been short, capacious vessels, from which stone balls were shot with small charges to a short distance, and at considerable elevation; they were essentially the parents of the present bombs or mortars (see fig. 2). The cannon (*canna*, a reed), on the other hand, were, for some time at least, of extremely small bore, scarcely larger than muskets of the 18th c.; they discharged leaden bullets, and would have probably been used as hand-weapons, but for their cumbrous and heavy workmanship, which necessitated small carriages. Arms of this description are doubtless those

Fig. 2, from the *Chroniques de St Denis*, Fourteenth Century. Fig. 3, Bombard of the Fifteenth Century, from Froissart. Fig. 4, Cannon of the Fifteenth Century, from *Les Vigiles de Charles VII.*

referred to as having been brought by Richard II. to the siege of St Malo, to the number of 400 pieces, where they are said to have kept up an incessant fire day and night on the town *without* success.

In the 15th c., armies for siege operations were usually accompanied by great and small guns, the latter being intended to keep down the fire of the besieged while the large bombards were being loaded, an operation requiring no small time. These guns were gradually improved, but it was not until the reign of Henry VIII. that the founders succeeded in casting iron ordnance, to the entire exclusion, thenceforward, of cannon formed of square or rounded bars welded together. England had even then become famous for the workmanship of its ordnance. The accompanying sketch (fig. 5) of a gun found in the wreck of the *Mary Rose*, which sunk at

Fig. 5.

Spithead in the above king's reign, will shew that a degree of excellence had been attained in the manufacture of artillery, little inferior to that which has lasted till our own day, when rifled ordnance are rapidly superseding cannon of smooth bores. Still, so late as Henry's reign, although great guns were found very serviceable in siege and naval operations, where the defences of those days offered but a trifling resistance to their power, they appear to have been looked upon rather as an encumbrance than an advantage with armies in the field. This is attributed partly to the heavy character of the guns themselves, and especially of their carriages, but more particularly to the badness, or rather absence, of the necessary roads for their transport. In 1522, it is recorded in the state papers that the 'kinges ordonauns [were] unable to pass over Stanes More towards Carlile.'

As time passed on, the details of the manufacture were improved, the general principles remaining the same; the size of the guns increased, while the proportionate weight of the carriages diminished; limbers (q. v.) were added, and the equipage of a gun gradually perfected and lightened. With increased calibre, to which augmented range was usually added, the number of cannon—at one period enormous—taken with an army was by degrees reduced,

ow a certain standard proportion between
' and infantry is ordinarily maintained. Of
this proportion differs with the opinions of
commanders; but the greatest modern
have always acted on the maxim, that it
ful to send a soldier on any duty of danger
ball can be made to perform. As a weapon
ice, Vauban doubted the utility of heavy
e when he applied the Ricochet (q. v.)
of firing. Napoleon may almost be said
won his battles by artillery, for he rarely
brought his infantry into action except as
, until a way had been opened for them,
anic caused, by the massed fire of large
s of guns. The Duke of Wellington also
the greatest attention to his ordnance-
hile, referring to recent events, the campaign
Clyde in Oude is a remarkable instance of
of artillery being pushed with abundant
to its greatest limit.

n of widely varying bores have at different

Fig. 6.
Leonardo da Vinci.

naturally out of the old bombard, and doubtless deviated by degrees more and more from the cannon. Fig. 6 shews a bombard or mortar designed in the 15th century. In very early days, we read in Arabian authors of a cylinder hewn in the rock at
Iria, and used as a mortar. Such a cylinder, large size, is still to be seen at Gibraltar, t was employed in the last siege against anish, when it was made to discharge of large stones, which spreading at times ance of 500 yards, constituted a formidable f defence.

e British service, the calibre of solid-shot described by the pounds which the shot m the case of guns for hollow shot or shell, nortars, by the inches in the diameter of the n some continental armies, the power of the sckoned by the weight of a *stone* ball fitted ore.

A gun is a frustrum of a right cone, with a cylinder (bore) removed around the axis; from which it follows that the thickness of metal is greatest at the breech, where it has to withstand the effect of ignited powder in its most condensed, and therefore most powerful state. Guns are first cast in loam or dry sand, then turned to the required shape, and lastly bored with the minutest accuracy. Formerly, they were cast with the bore already formed; but the direction was rarely exactly correct, and the surface scarcely ever strictly even. Some additional particulars of their manufacture will be given under GUN-FACTORIES, ROYAL; and the science of artillery will be summarised under GUNNERY.

An article on firearms would be incomplete without some allusion to the progress made in small-arms. In the 15th c., the smallest sort of cannon were probably at times mounted and used as hand-guns. From this the step to the arquebus was rapid; that weapon developed as years passed into the clumsy matchlock; that into the firelock and flint-musket; then the percussion-musket; and lastly, into the beautiful rifles of our own day. For diminutives, small arquebuses were made to do duty as horse-pistols; genuine pistols succeeded them; these were gradually improved and reduced in size, till they have culminated in the saloon pistol, available for a waistcoat-pocket; and the deadly revolver, which quadruples a man's defensive power. All these weapons are described under their respective heads—ARQUEBUS, MATCHLOCK, MUSKET, PISTOL, REVOLVER, RIFLE.

Many valuable works have been written on firearms from the days of Leonardo da Vinci and Tartaglia to the present. Among those consulted for this article have been *Etudes sur le Passé et l'Avenir de l'Artillerie* of the Emperor Napoleon III.; *Our Engines of War*, by Captain Jervis; Major Straith's *Treatise on Artillery*; General Chesney *On Firearms*, &c.

FIREARMS, PROVING OF (in Law). In consequence of the frequency of accidents from the bursting of insufficient barrels, the legislature has interfered, not to regulate their manufacture directly, but to prevent all persons from using or selling them until they have been regularly proved in a public proof-house. The first act for this purpose, which was passed in 1813, was soon after superseded by the fuller and more complete one (55 Geo. III. c. 59). By this statute, a fine of £20 is imposed on any person using, in any of the progressive stages of its manufacture, any barrel not duly proved; or any person delivering the same, except through a proof-house; and on any person receiving, for the purpose of making guns, any barrels which have not passed through a proof-house. These penalties are to be levied on conviction before two justices, and the like penalties on persons counterfeiting the proof-marks. The statute does not extend to Scotland or to Ireland, and arms manufactured for Her Majesty, are exempted from its operation. By 10 Geo. IV. c. 38, repealing 6 Geo. IV., the malicious and unlawful use of firearms in Scotland is punishable. See GAME LAWS.

FIREBALLS are projectiles occasionally discharged from guns or mortars, for the purpose either of setting fire to, or of merely illuminating some work, against which hostile operations are directed. The usual ingredients are—mealed powder, 2; saltpetre, 1½; sulphur, 1; rosin, 1; turpentine, 2½; with pitch, tow, naphtha, &c., as circumstances dictate. The use of fireballs has, however, been in great measure superseded by the introduction of rockets (q. v.),

and incendiary shells (q. v.). Akin to the fireball, was the *fire-arrow* of ancient warfare, which consisted of tow steeped in pitch, rosin, or some inflammable mixture, wrapped round the shaft, and fired alight among an enemy's works or troops. Greek fire was also discharged in many cases on large arrows surrounded by tow and shot from *balistæ*.

FIREBOTE, the right of a tenant for life or years, according to English law, to cut wood on the estate for the purpose of fuel. See ESTOVER.

FIREBRICK. See BRICK.

FIRECLAY is the variety of clay which is employed in the construction of gas-retorts, glass-pots, firebricks, crucibles, &c., which require to withstand high temperatures. It is found chiefly in the coal measures; and the more famous kind is the Stonebridge, which is found in a bed about four feet thick. It also occurs largely near Glasgow, Newcastle-on-Tyne, and in Belgium and France. The principal constituents of fireclay are silica and alumina, accompanied by small proportions of iron, lime, magnesia, water, and organic matter, as may be observed from the following table:

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.
Silica,	64·10	51·10	48·55	69·25	83·29
Alumina,	23·15	31·35	30·25	17·90	8·10
Oxide of Iron,	1·85	4·63	4·06	2·97	1·88
Lime,	...	1·46	1·66	1·30	
Magnesia,	0·95	1·54	1·91		2·99
Organic Matter and Water,	10·00	10·47	10·67	7·50	3·64

Fireclay is found abundantly, near and at the surface of the ground, and is readily reduced to powder by travelling wheels. When kneaded with water, and fashioned into vessels and other articles, it is dried, and is then generally subjected to a strong heat, which drives off the water and organic matter, causes the silica to unite more firmly with the alumina, &c., and leaves a more or less porous material, which can withstand very high temperatures. The Passau crucibles are merely dried, and are not fired like Hessian crucibles and other fireclay wares. The larger the percentage of silica (sand) in the clay, the more refractory are the articles fashioned from it; and hence sand is often added to clay to increase its fusing-point and refractory powers; but a certain proportion of alumina, &c., is required to serve as a flux, to cement and hold together the particles of sand. The proportions of sand and clay are determined by the temperature to which the manufactured article is intended to be exposed; and the fireclay of crucibles or bricks, which are serviceable at a comparatively low temperature, as in the lining of limekilns, would become soft, and yield in glass or porcelain furnaces.

FIREDAMP is the miners' term applied to light carburetted hydrogen or coal-gas when it issues from crevices in coal-mines. See GAS.

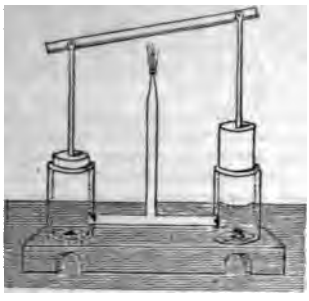
FIRE-EATING, a name usually given to a variety of feats performed by jugglers with flaming substances, melted lead, red-hot metal, &c. Evelyn, writing under date October 8, 1672, thus describes fire-eating in his day: 'I took leave of my Lady Sunderland. She made me stay dinner at Leicester House, and afterwards sent for Richardson, the famous fire-eater. He devoured brimstone on glowing coals before us, chewing and swallowing them; he melted a beer-glass, and eat it quite up: then taking a live coal on his tongue, he put on it a raw oyster; the coal was blown on with bellows till it flamed and sparkled in his mouth, and so remained till the oyster gaped, and was quite broiled; then he melted pitch and wax with sulphur, which he drank down as it flamed; I saw it flaming in his mouth a good while; he also took up a thick piece of iron, such as laundresses use to put in their smoothing-boxes, when it was fiery hot, held it between his teeth, then in his hand, and threw it about like a stone; then he stood on a small pot, and bending his body, took a glowing iron with his mouth from between his feet, without touching the pot or ground with his hands; with divers other prodigious feats.' About 1818, Signora Josephine Girardelli, who described herself as the 'original Salamander,' performed astonishing feats of this kind in London and other places in England. According to the accounts of her, 'She commences her performances by passing plates of red-hot iron over her legs; she then stands with her feet naked on a plate of red-hot iron, and afterwards draws the same plate over her hair and across her tongue,' &c. About the same time appeared in Paris M. Chaubert, whose astonishing powers of resisting heat attracted the attention of the National Institute. Among other things performed by this person, was his going into a common baker's oven, with a leg of mutton in his hands, and remaining with the oven closed until the mutton was completely dressed. Another of his performances was standing in a flaming tar-barrel until the whole of it was consumed around him. He subsequently exhibited in London.

Many of the feats of this kind are undoubtedly mere tricks, or illusions, produced by sleight of hand; others are capable of scientific explanation. There is nothing more wonderful in stuffing blazing tow into the mouth—a common form of mountebank fire-eating—than in eating flaming plum-pudding, or in dipping the finger into spirits and letting it burn like a candle. It is also well known that the tongue, or the hand dipped in water, may be rubbed with impunity against a white-hot bar of iron; the layer of vapour developed between the hot metal and the skin prevents contact and produces coolness (see SPHEROIDAL STATE OF LIQUIDS). Such performances as those of M. Chaubert are explained by the well-known power of the living body to maintain its normal temperature, for a time, independently of the external temperature (see ANIMAL HEAT).

FIRE-ENGINE, a machine employed for throwing a jet of water for the purpose of extinguishing fires. This name was formerly applied to the steam-engine. Machines for the extinguishing of fires have been used from a very early date. They were employed by the Romans, and are referred to by Pliny; but he gives no account of their construction. Apollodorus, architect to the Emperor Trajan, speaks of leathern bags, with pipes attached, from which water was projected by squeezing the bags. Hero of Alexandria, in his Treatise on Pneumatics—written probably about 150 years before the Christian era—proposition 27, describes a machine which he calls 'the siphons used in conflagrations.' It consisted of two cylinders and pistons connected by a reciprocating beam, which raises and lowers the pistons alternately, and thus, with the aid of valves opening only towards the jet, projects the water from it, but not in a continuous stream, as the pressure ceases at each alternation of stroke.

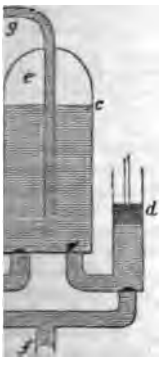
The accompanying copy of Hero's diagram explains itself. Little or nothing is known as to the extent to which engines of this kind were practically used. We have accounts of 'instruments for fires,' and 'water syringes useful for fires,' in the building accounts of the city of Augsburg, 1518; and in 1657, Caspar Schott describes a fire-engine used in Nuremberg, which must have been almost

ical in construction with that described by Hero. d a water-cistern, was drawn by two horses, rorked by 28 men, and threw a jet of water,



h in diameter, to a height of 80 feet. It was ıtil late in the 17th c. that the air-chamber ose were added; the first being mentioned rault in 1684, and the hose and suction-pipe invented by Van der Heide in 1670. In id, hand-squirts were used up to the close 16th century. They were of brass, and ıed three or four quarts of water. Two men ıe handles at the sides, while a third forced piston. The nozzle was dipped in a vessel er after each discharge, then raised, and the again forced out. So clumsy an apparatus nave been but of little service in the fearful rations to which our old wood-built towns ı subject.

ı the addition of the air-chamber and hose, me improvement in the details of construche 'siphons' of Hero became the modern gine. The principle of the action of the air-er, and of its connection with the pumps, &c., easily understood by the aid of the annexed n, where *a* represents in section a piston ascending, *d* the other piston descending, *f* the pipe or hose communicating with the water-supply, *g* the hose that conveys the issuing stream to the fire, *bc* the level of the water in the air-chamber, *e* the space above filled with compressed air. The rising piston raises the water from *f* to fill its cylinder; the descending piston forces the water contained in its cylinder into the bottom of the air-chamber, and thereby compresses the air in *e*. The pistons rise and descend alternately. The



ıed air reacts by its elasticity, and pressing ıe surface *bc*, forces the water through the

In the space *e*, above *bc*, the whole of the formerly filled the chamber is supposed to ıressed. Assuming this to be one-third of its bulk, its pressure will be about 45 lbs. to the inch, and this pressure will be continuous ırly steady, if the pumps act with sufficient ıd rapidity to keep the water at that level. may be compressed to any extent—and its ;y is increased in exactly the same proportion orce that may be stored in the compressed ıly limited by the force put upon the pumps, strength of the apparatus.

r proposition 9 of the same work, in which ıhons used in conflagrations' are described, Hero describes and figures the air-chamber as 'a hollow globe or other vessel, into which if any liquic be poured, it will be forced aloft spontaneously and with much violence, so as to empty the vessel, though such upward motion is contrary to nature.' The globe is represented with a single piston attached for compressing the air. Thus, about 1800 years elapsed before proposition 9 and proposition 27 of this work were put together for so obvious and useful a purpose as the fire-engine, although the book was tolerably well known to the mathematicians of the period; and when they were put together, it was probably done by a practical man, who had never heard of the name of Hero.

The more recently constructed fire-engines include contrivances for preventing the entrance of mud and gravel, and for getting readily at the valves in case of their being out of order, while the cistern is dispensed with, a hose being carried directly to the water-supply. They are usually drawn by two or four horses, though smaller engines are made to be drawn by hand or by one horse. The hose is of leather, fastened by metal rivets, instead of the sewing formerly used. In the United States, cotton is woven into a tube by machinery constructed for the purpose. Two such tubes are fitted one within the other, and held together by a solution of India-rubber, which, on consolidating, forms a water-tight layer.

The fire-engines of the London Fire Brigade establishment have usually 7-inch barrels with 8-inch stroke, and throw about 90 gallons of water per minute. Their weight, with implements, firemen, and driver, is about 30 cwt. These are found more convenient for general purposes than larger engines, as they can be drawn at a gallop by two horses for a distance under six miles. Four horses are used for greater distances. When a large engine is required, two of these may be joined together, and throw 180 gallons per minute. The pumps are worked by levers, with long horizontal bars attached, to enable a number of men to work together upon the same pumps. Many larger engines than these have been constructed, and steam has been successfully applied. The first application of the steam fire-engine was made when the Argyle Rooms in London were burned in 1830. Several floating fire-engines for conflagrations near the Thames have been constructed and worked by steam; one of these is capable of throwing 1400 gallons per minute. A floating engine was used with considerable effect when the Houses of Parliament were burned; but at the fire of the warehouses near London Bridge (1861), the fury of the combustion, when at its maximum height, was so great, that the combined efforts of all the London engines, whether worked by steam or by hand, had no perceptible effect in subduing it. For all ordinary fires, the hand-engines above referred to are the most useful, as they can be brought to the spot and set in action immediately, whereas some time must always be lost in getting up the steam, and in bringing to the locality of the fire the larger steam fire-engine. The saving of a few minutes is often of more importance than doubling the quantity of water. These more powerful engines are therefore only likely to be used for great fires, where the smaller engines, after working for some time, are found to be insufficient.

It has been questioned whether, in cases of very intense combustion, a comparatively small stream of water has any subduing effect at all—some assert that it may even increase the conflagration. It appears that carbon, in a state of intense incandescence, is capable of decomposing water by combining with its oxygen to form carbonic oxide; this gas,

as well as the hydrogen liberated from the water, is itself combustible; and it is asserted that the heat generated by the combination of these two gases exceeds that which is lost in decomposing the water, and expanding it to the gaseous form. This, however, is doubtful, for the subject has not yet received a sufficient amount of exact investigation to warrant any decided conclusion either way.

For working fire-engines, an organised body of *firemen* are required. In London, the fire insurance companies formerly had separate establishments of fire-engines and firemen; but in 1825 some of them united, and by 1833 all the important companies combined, and the London Fire-brigade was formed, under the management of the late Mr Braidwood, whose death in the discharge of his duties at the great fire just referred to was justly deplored throughout the country as a national loss. The men of the brigade wear a uniform, with strong helmets and metal epaulets, to protect them from the blows of falling beams, &c. They have about twenty stations in the metropolis, with from one to four engines, and a proportionate staff of men at each. The courage and skill of the men in making their way through and about burning buildings, for the purposes of directing the stream from the hose, or for saving life and property, and the general efficiency of the whole organisation, are worthy of the highest praise. Most of our provincial towns now have a fire-brigade upon the same model as that of London. The fact that Paris has seven times as many firemen as London, is a tolerable proof of the amount of work the London firemen are called upon to perform. At Paris, as on the continent generally, the fire-engines and firemen are under government control; and the *sapeurs pompiers*, or firemen, are empowered to enforce the assistance of any people they can find in the streets. As the insurance companies in England pay a fee to the first person who gives notice of a fire at the engine station, there is always a supply of volunteers from among cabmen and people in the streets, besides policemen, to perform this important service; and in like manner the pump-bars of the fire-engines are always fully manned.

In many continental towns, fire-watchmen are stationed in commanding situations, such as church-towers; and their duty is to ring a fire-bell, or otherwise give the alarm, immediately upon observing a conflagration. The fire-companies of the United States are composed of volunteer firemen, who receive no pay, but certain immunities from taxation and militia service. Their annual parade-day is quite a fete. Each company has a special uniform; and in some cities the rivalry among them is so great, that they frequently have desperate fights for the best 'location' for their engines. Prizes are awarded to those whose engines throw a jet of water to the greatest height.

In Constantinople, there are two fire-towers, one on each side of the Golden Horn, with watchmen continually stationed there. A large wicker-ball is hauled up to the side of the tower as a signal, and the cry of 'There is a fire at Scutari, Tophanè,' or whatever be the quarter of the city in which it occurs, is raised and taken up by the patrol, who strike the pavement with their iron-bound staves as they repeat the cry. In a few minutes, the alarm is thus spread throughout the whole city. Even though the fire be at Scutari, on the opposite side of the Bosporus, the whole of Constantinople is roused in this manner. The patrol compel the inhabitants to assist in extinguishing the fire; and the method usually adopted is to pull down the houses to the leeward, and thereby isolate the conflagration. According to the old custom, if the fire lasted above an hour, and was three times proclaimed, the sultan had to appear in person, to encourage the firemen and people in the work. This custom is said to have been sometimes the cause of fires, the people taking this method of making their grievances known to the sultan himself. At present, the pasha of the district is summoned in such cases.

FIRE-ESCA'PES. An immense number of contrivances have been at different times proposed for enabling people to escape by windows and house-tops from burning buildings. They are of two distinct kinds—one for affording aid from outside, and the other for enabling those within the house to effect their own escape. Of the latter, the simplest is a cord that should be firmly attached to the window-sill of every sleeping-apartment, and coiled up either in a box on the floor, or under a dressing-table, or other suitable place. A rope one-quarter or three-eighths of an inch thick, and knotted at intervals of about a foot, is well adapted for the purpose. A good quarter-inch sash-cord will support from three to four cwt. or more if new, and will cost from 6*d.* to 2*s.*, according to the height of the room. A man with tolerable nerve may let himself down by means of such a cord, either by placing his feet against the wall and bringing 'hand over hand' down upon the knots, or by clinging with his feet and knees to the rope as well as with his hands. A man may let down a woman or child by means of a sack at the end of the rope, or simply by fastening them to the end, and letting the rope pass through his hands, aided if necessary by the friction of the window-sill, if it be allowed to bend over it. A rope coiled upon a drum inside a dressing-table, with a winch-handle to uncoil it, is another form. A pulley fixed to the window-sill, over which runs a rope with a chair or simple board to sit on, is a well-known contrivance.

Some means of escape from every sleeping-room should be provided, and the inmates should be thoroughly prepared by knowing beforehand how to act in case of a fire cutting off communication with the usual means of outlet. In a row of houses with projecting balconies, a board of sufficient length to reach from the balcony of one house to the next may be kept in each room, or even a rope might be thrown across with the aid of a stone or lump of coal, &c., tied to one end. An exit by the roof or from the window on to the parapet affords a ready means of escape from a top-story, and should always be provided in tall houses. In case of emergency, when no provision has been made, the cord holding the sacking of the bedstead may be undone, or the bedclothes and curtains tied together to form a rope; or as a last resource, the bedding may be thrown out of window to form a cushion to alight upon in case of the cord or bedclothes being too short to reach the ground; or if there be no time to extemporise such contrivance and it should be necessary to drop directly from the window, in this case, it would be better to hang by the hands from the window-sill and then drop, than to jump direct, as the height of the fall would be somewhat diminished thereby. In all such cases, presence of mind and coolness is of the utmost importance, and may render very simple and slender means of escape more effectual than the most complete and elaborate would be without these qualities; and presence of mind may be to a great extent acquired chiefly by being mentally prepared, and, if possible, by rehearsals of what should be done in case of danger.

Fire-escapes, to be used from without, consist either of simple ladders kept in churches, police-offices,

r convenient stations, or a series of lad-
at can be jointed together; of poles with
attached; of ropes with weights at one end,
ey may be thrown or shot into windows; of
ations of ladders, ropes, bags, baskets, nets,

EFLY, a name common to all winged
ts insects, at least to all that possess much luminosity. Except the lantern-fly (q. v.), they are all coleopterous, and belong to two nearly allied tribes. *Lampyrides*, to which the glowworm (q. v.) also belongs, and *Elateriides*, to which belong our skipjack beetles, and of which the larvæ are too well-known to farmers as wire-worms. The

(*Lampyris Italica*).

owworm, which alone is winged, has too little
ity ever to receive the name of F., but the fireflies of the south of Europe (*Lampyris Italica*, and of Canada (*L. corusca*) are nearly allied to it. See GLOWWORM. Fireflies are only seen in the most southern parts of Europe. They abound in almost all the warmer parts of the world, and the brilliancy of the spectacle presented by them when glancing about in numbers amidst the darkness of night, has been often described with enthusiastic admiration. Mr Gosse says of the Canadian F.: 'The light is of a yellow colour, very different from the blue gleam of the English glowworm: from this circumstance I at first took them for candles in the woods, and though told what they were, at every one that appeared, the same idea would come across my mind. . . . They more frequently give out the light while flying, than when crawling or resting, though we may often observe the intermittent gleam as one crawls up a stalk of grass, or rests on the leaf of a tree. They fly slowly, and as they fly, emit and conceal their light with great regularity at intervals of two or three seconds; making interrupted lines of light through the air, gleaming slowly along for about a yard, then suddenly quenched, and appearing again at the same distance ahead. The insect is a pretty beetle, with soft elytra, of a light-brown colour, marked with red, and handsomely striped; the light proceeds from the last three segments of the abdomen, which are of a delicate cream colour by day. At night, these three segments are bright at all times; but at the regular intervals I have mentioned, they flash out with dazzling splendour. If this part be plucked off and crushed, many patches of brilliance occur for a few moments among the flesh, but they gradually die away.' He further describes these fireflies as appearing in great numbers in summer evenings, over wet and marshy ground, millions of them above a river, or over the surface of a large field, like stars on a clear winter night, but flashing and disappearing, and moving about in mazy evolutions.—But still more brilliant are the fireflies of more tropical regions, belonging to the tribe *Elaterides*, as the F. of the West Indies (*Elater noctilucus*), which gives out its light chiefly from two eye-like tubercles on the thorax. The light is so powerful, that the smallest print may be read by it; and this becomes quite easy if a few of the insects are enclosed in a small glass vessel. They are not unfrequently employed—particularly in St Domingo—to give light for household purposes; and they are used for purposes of decoration on festival-days by women, who attach them to their dress or to their hair. One which had been accidentally brought alive to Paris, once astonished and alarmed the Faubourg St Antoine. These insects are caught in some parts of the West Indies—a torch being used to attract them—and brought into houses to destroy mosquitoes, which they eagerly pursue and devour. See LUMINOSITY OF INSECTS.

Firefly (*Elater noctilucus*).

FIRELOCK, the name applied on its introduction, in 1690, to the old musket, which produced fire by the concussion of flint and steel, to distinguish it from the *matchlock* previously in use, which had been fired by the insertion of a lighted match at the powder-pan. Writers of the earlier part of the 18th c. called firelocks 'asnaphans;' a word obviously corrupted from the Dutch *snaphaan*, and leading to the inference that they were brought to England by

William III. and his Dutch auxiliaries. Their first invention is, however, involved in obscurity. The weapon was superseded before 1830 by the percussion musket; which, in its turn, has now yielded to the rifle (q. v.).

FIRENZUOLA, Angelo, an author distinguished for the Attic choiceness of his language, was born at Florence in 1493. Having completed at Perugia the studies which he commenced in Florence, he proceeded to Rome in anticipation of a brilliant legal career, but shortly abandoned the eternal city, disappointed in hope and shattered in health. It seems well authenticated, that he finally enrolled himself among the monkish brotherhood of Vallombrosa, and rose to considerable influence, in spite of the extreme licence of morals, and licentiousness of writing for which he was noted. The date of his death is doubtful, but it is generally placed between 1542 and 1544. His chief works are a spirited paraphrase of the *Golden Ass of Apuleius*—in which he is generally considered by his countrymen to have far excelled the original in nerve and beauty of language; *I Discorsi degli Animali*—containing some sound lessons of just legislation to the ruling powers, the censure being skilfully veiled by means of his animal orators; *I Ragionamenti*, a work in close imitation of the *Decameron* both as regards the impurity of sentiment, and classic purity of language; *Il Trattato della bellezza delle donne*, an eulogistic discussion concerning the charms of the gentle sex, to whom he was inordinately devoted. His works were published in Florence after his death. The best edition is that of Florence (1763, 3 vols.).

FIRE-POLICY. See Insurance.

FIRE-PROOF BUILDINGS. The problem of constructing warehouses, dwelling-houses, &c., that shall be proof against all risk of conflagration, has not yet been solved. The liability to conflagration may be greatly diminished by the construction of a building, but cannot be entirely averted; and therefore, in all 'fire-proof' buildings containing furniture or other combustible materials of any kind, the ordinary precautions against fire should be strictly observed. It is well to state this at the outset, as, unless it be understood, a so-called fire-proof building may be more dangerous than an ordinary one, especially in warehouses, &c., intrusted to the care of watchmen and others, who, relying upon the supposed immunity the name expresses, are liable to neglect many precautions they would not fail to observe in a building believed to be dangerous. The most destructive fire that has occurred in London since 1666 was the recent one at Cotton's Wharf, the warehouses of which were what is called 'fire-proof.' The great fury of this conflagration depended on the nature of the goods that were stored. It is scarcely possible to believe that such combustibles as tallow, turpentine, &c., could have been stored in the vicinity of saltpetre, unless there had existed some faith in their practical isolation from each other by the fire-proof divisions of the building, as it is so well understood that saltpetre, though incombustible of itself, intensifies to an immense extent the combustibility of all combustibles, by supplying them with undiluted oxygen when heated in contact or within a moderate distance of them.

The nearest approximation to fire-proof construction may be obtained as follows: the walls should be of stone or brick, and any ties, lintels, &c., required in the construction should be of iron. The staircases should be of iron or stone, and the floors or landings of tiles, concrete, or stone. Wherever wood is inevitably used, it should be prepared with silicate of soda (see Fire-proofing). Instead of wooden joists to support the floors of each story, arched stone or brickwork should be used, and this should be put together with sufficient care to be independent of the mortar. The roof should be constructed in like manner, wooden rafters being entirely excluded. The doors should be of iron, and the security would be much increased if the doors between any two apartments containing combustible materials were double, with a space between them equal to the thickness of the walls. Of course, it is not practicable to carry out all these precautions in a dwelling-house, but the danger from fire may be considerably diminished by attending to some of them. Wooden staircases are especially dangerous. The most important conditions for a warehouse are, that each apartment shall be separated from the next by stout walls of non-conducting materials, and more especially, that each shall be as nearly as possible air-tight; and whenever, from the nature of the goods, ventilation is required, it should be obtained by periodically opening the doors and windows. If this latter condition is fulfilled, any fire would extinguish itself, unless there be along with the combustible goods some oxygen-giving substance, such as saltpetre, chlorate of potass, or other nitrates or chlorates.

At first sight, it may appear that a warehouse built entirely of iron, would be effectually fire-proof, but this is far from being the case. In the first place, iron conducts heat more readily than any other material used in building; secondly, cast-iron is liable to crack and split when suddenly heated or cooled. Iron supports may, under some circumstances, be even more objectionable than wood, for if the water from a fire-engine were to play upon a heated cast-iron girder, it would probably give way immediately, while a stout wooden beam might be extinguished before being burned through. When buildings supported by iron girders are burning, they are far more dangerous to firemen than those with wood, as the experienced fireman can form a pretty accurate judgment of the time that burning wooden beams will stand, and may move about in their vicinity to direct the stream of water to where it is most needed, but iron girders split and fall without visible notice. It is on this account that floors of arched masonry are recommended above. In great fires, the heat is sufficient to fuse iron.

Without going to the expense of making warehouses and manufactories absolutely fire-proof, certain precautions not of a costly nature might be usefully adopted, for the purpose of merely checking the progress of conflagration until the arrival of fire-engines. Among these simple measures, may be included iron doors hinged on stone between different departments; a sufficient deafening not easily destructible between the ceiling of one story and the floor of that above; and stone stairs. For rendering timber difficult of combustion, see Fire-proofing.

FIRE-PROOF SAFES AND REPOSITORIES are used as receptacles for deeds, paper-money, account-books, and other valuables. They are now regular articles of commerce, and are to be found in almost every counting-house, lawyer's office, jeweller's or watchmaker's shop or warehouse, and are indispensable to banking and such-like establishments. Our forefathers used oaken chests secured with iron straps and studs for similar purposes. That which formerly contained the crown-jewels of Scotland, and is still exhibited in Edinburgh Castle, is a good example. Subsequently, iron chests made simply of stout cast or wrought iron were used.

The modern safe has double walls and doors of stout iron plates, and the space between the plates is filled with some substance that shall resist the transmission of the heat which would be readily conducted through solid iron. The materials used for these linings are very various—sand, dried clay, charcoal, ashes, bone-dust, alum, gypsum, &c. The safes of Messrs S. Mordan & Co., which are largely used by bankers, are lined with a mixture of equal parts of saw-dust and alum. Some makers include small vessels containing liquids, the vessels burst when heated, and the liquids exert some cooling effect. Alum acts in nearly the same manner. It contains 24 equivalents of water, or nearly half its weight. At 212°, ten equivalents are driven off in vapour; at 248°, ten more; and at 392°, the four remaining equivalents are volatilised. It is a mistake, however, to suppose that any of these linings can render such a safe really fire-proof; and this is admitted by the more scrupulous manufacturers, who carefully abstain from using the designation of 'fire-proof,' but apply that of 'fire-resisting,' which honestly describes all that they are capable of doing, as they may resist the action of fire for a considerable time; but whether or not their contents may be ultimately preserved from a fire, is simply a question of the duration and intensity of the heat to which they are exposed. Their great weight in some cases assists in preserving them, especially when on an upper floor, as such a safe would be the first thing to break through the burning joists and descend to the lower part of the building, where the fire is usually the most smothered. These safes are sometimes let into recesses of stout masonry, built on purpose, and protected by an additional double iron door. This, of course, adds greatly to their security. All such safes should of course be secured by the best locks that can be made, protected by every possible precaution against picking, blowing up by gunpowder, or other violence. See LOCKS.

FIRE-PROOFING. Attempts have continually been made to render cotton, linen, and other textile fabrics, timber, &c., incombustible; but at present they have been but partially successful. There are many means by which fabrics may be prevented from flaming, their combustion being reduced to a slow smouldering; and the many recent cases of fatal results from the present extravagant dimensions of ladies' dresses have rendered the adoption of some such protection against fire very desirable. By moistening the fabric with a solution of any saline substance, which, upon drying will leave minute crystals deposited in or between the fibres, its inflammability will be greatly diminished, but the salt imparts a degree of harshness to the fabric, and in many cases weakens the fibres. Alum, sulphate of zinc, and sulphate of soda have been used, and are effectual to prevent flaming, but they weaken the fibre. Common salt does the same. Phosphate and sulphate of ammonia are less objectionable on this account, but the former decomposes by contact with the hot iron in ironing. Tungstate of soda has been proposed, and is said to have no injurious effect on the fibre. Sulphate of ammonia, chloride of ammonium (sal ammoniac), and borax, are among the best fitted for domestic use, though they are not unobjectionable. For made-up clothing, borax is, perhaps, the best, as it is most effectual in its action, and is the least injurious to the appearance of the article, though it is stated to have some weakening effect on the fibre; this, however, is only perceptible in case of a tearing strain, and will not perceptibly damage such articles as ladies' underclothing, or anything else only subject to ordinary wear. Wood has been treated in a similar manner. Milk of lime, alum, sal ammoniac, sulphate of ammonia, chloride and sulphate of zinc, sulphuret of lime and baryta, &c., have been used, and its *inflammability*, but not its *combustibility*, is destroyed. Like the fabrics, when similarly treated, wood smoulders slowly. The most efficient protection to wood is silicate of soda. If planks of moderate thickness be brushed three or four times over, on each side with a strong solution, they are rendered almost incombustible; they will only burn when very intensely heated. The silicate fuses and forms a glass which envelopes the surface, and even the internal fibres of the wood, if it be sufficiently saturated, and thus seals it from the oxygen of the air.

FIRE-RAISING, in the law of Scotland, is the equivalent term for Arson (q. v.) in England. If any part of a tenement, however small, has been set fire to wilfully, this crime has been committed. It is quite indifferent where the fire has commenced, and the offence is frequently perpetrated by setting fire to furniture, or to other objects either within or without a house; but it is not regarded as completed, and is punished as a separate crime, of which we shall speak afterwards, unless the fire has communicated itself to some part of a building. If the fire originated in carelessness, however gross, it is not wilful fire-raising, but a minor offence, punishable with fine and imprisonment. But if the intention was to injure the proprietor of a tenement by burning, not his house, but an object in its neighbourhood—e. g., a haystack—and the fire was accidentally communicated to the house, the offence is the same as if the fire had been applied to the house directly. The infliction of capital punishment for the offence of fire-raising is now in desuetude. Where a man burns his own house without endangering the life of any one, he has not committed the crime of fire-raising, but he may be punished criminally, if the act was done for the purpose of defrauding the insurers. Till recently, it was the rule in Scotland, that where fire was the result of inevitable accident, it freed a carrier or innkeeper from responsibility for any goods that were destroyed in his custody, unless where fraud or collusion could be shewn; but the law in this respect has been altered by the Mercantile Law Amendment Act, 19 and 20 Vict. c. 60, which provides, s. 17, that after the passing of the act (1856), 'All carriers for hire, of goods within Scotland, shall be liable to make good to the owner of such goods all losses arising from accidental fire while such goods were in the possession or custody of such carriers'—thus equalising the law of Scotland with that of England.

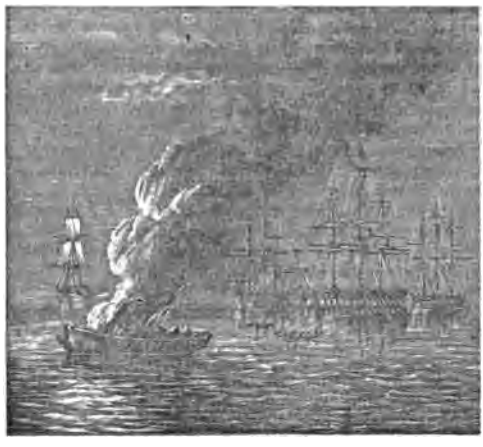
Attempting to set fire to houses, crops, &c., is a distinct crime from Arson (q. v.), or the actual destruction of property by fire. By 9 and 10 Vict. c. 5, it is enacted, that if any one shall attempt to set fire to a house, &c., with such intent that the offence, if committed, would be felony, and liable to be transported for life, he may be transported for fifteen years (now penal servitude), or imprisoned for two years. The attempt to burn growing crops of corn, &c., is a felony by 7 and 8 Geo. IV. c. 30, and punishable by transportation for seven years, or by imprisonment. These offences are also misdemeanours at common law. By 24 and 25 Vict. c. 97, s. 8, the attempt to set buildings on fire is punishable by penal servitude for fourteen years, or imprisonment for two years; if a male under sixteen, to be whipped.

In Scotland, an attempt to commit wilful fire-raising (q. v.) is an offence at common law. It is not necessary to constitute this offence that the fire should have consumed any part of the building, &c. Furniture—as a mattress—partly consumed,

a lighted [illegible] at thrust under a stack without igniting it, are sufficient to warrant a conviction. Inciting others to commit fire-raising is an indictable offence; and, in some old cases, persons have been punished for the mere threats to commit the offence, without being guilty of any overt act.

The English Act 9 and 10 Vict. c. 25, declares that whoever shall maliciously, by the explosion of gunpowder or other explosive substance, destroy or damage any dwelling-house in which there is any person at the time, is guilty of felony, and shall be subjected to transportation for life, or not less than fifteen years, or to an imprisonment not exceeding three years. Blowing up a building with intent to murder, and thereby endangering life, or casting upon any person any explosive or corrosive fluid whereby grievous bodily harm is occasioned him, and similar offences, are declared subject to the same punishment. Attempting any of these offences subjects the perpetrator to a minor punishment. The manufacturing or having in possession any explosive substance, or dangerous or noxious thing, or any machine or instrument for the purpose of committing any of the above offences, is a misdemeanour, liable to imprisonment not exceeding two years. Male offenders under eighteen years of age, convicted under the act, may be whipped.

FIRE-SHIP, a vessel, usually an old one, filled with combustibles, sent in among a hostile squadron, and there fired, in the hope of destroying some of the ships, or at least of producing great confusion. Livy mentions the use of such by the Rhodians, B.C. 190; but among the first occasions in modern times when they are known to have been employed, were by the Dutch in the Scheldt during the War



Fire-Ship.

of Independence in the Netherlands, and, shortly after, by the English in 1588, against the Spanish Armada. The Chinese tried them against the British fleet before Canton in 1857, but unsuccessfully. The service of navigating one of these ships into the midst of an enemy, there firing it, and then attempting to escape, is always fraught with great risk of failure and disaster.

FIREWORKS. See PYROTECHNY.

FIRE-WORSHIPPERS. See GUEBERS.

FIRISHTA, MOHAMMAD KASIM HINDU SHAH, a celebrated Persian historian, born towards the end of the 16th c. (1570?), at Astrabad, on the Caspian Sea. At a very early age, he went with his father (Gholam Ali Hindu Shah) to India, where we find him, when twelve years old, at Ahmednuggur, in the Deccan, sharing the instruction which the latter gave to Prince Miran Hussein Nizam Shah. He afterwards became captain in the body-guard of Murteza Nizam Shah; and when this king was deposed by his own son, F.'s former fellow-student—who, in his own turn, was deposed and murdered in less than a twelvemonth afterwards—F. went to Bijapore (998 H., 1589 A.D.), where Ibrahim Adil Shah II., the reigning monarch, received him with great honour. He also appears to have conferred a military rank upon him, as, soon after his arrival, F. is mentioned as taking part in an action against Jumal Khan, in which he was wounded and taken prisoner, but ere long he made his escape. His death is supposed to have taken place shortly after the year 1612. His great work is the *Tarikhi Firishta*, or History of the Mohammedan Power in India, which he finished in 1018 H. (1609 A.D.). Twenty years were spent in its preparation, and the number of books used for, and partly embodied in it—special histories of certain periods and provinces—amounts, according to F. himself (Introduction), to thirty-five; but twenty others besides these are quoted in the course of the work. It consists—besides a preamble or introduction on the Progress of Mohammedanism in India, and a final treatise on the geography and the climate of India—of 12 divisions, treating of the kings of Ghizni and Lahore, Delhi, the Deccan, Guzerat, Malwah, Candeish, Bengal and Behar, Mooltan, Sinde, Cashmere, Malabar, and of the saints of India. Written with an impartiality, simplicity, and clearness rare in an Eastern work, this history has become a standard work on the subject, into which it was the first to enter at length. Single portions of it have been translated by Dow, Scott, Stewart, Anderson, &c.; but the whole work, edited first by J. Briggs (Bombay, 1831, fol. 2 vols.), was also translated by him (London, 1832, 8vo, 4 vols.). A fuller account of F.'s life and writings, by the same, will be found in the second volume of the Transactions of the Asiatic Society.

FIRKIN (dim. from *four*, the fourth part of a barrel), an old measure of capacity containing nine gallons (old ale and beer measure). But previous to the year 1803 it had two values, being estimated at eight gallons in old ale measure, and at nine in old beer measure. The firkin is equivalent to 9¼ imperial gallons. See GALLON.

FIRLOT (according to Jamieson, from Ang.-Sax. *feorth* and *lot*, the fourth part), an old Scotch dry measure, of which there were four in a Boll (q. v.). Though differing in value for different substances and places, its relation to the boll remained invariable. See PECK.

FIRM. See PARTNERSHIP.

FIRMAMENT, a word in use of old to signify the vault of heaven. The term found its way into English from the Vulgate, which renders the Septuagint *Stereoma*, and the Hebrew *Rakia*, by the Latin *Firmamentum* (Gen. i. 6). Rakia (from the verb *raka*, to beat or strike out) signifies whatever is expanded or stretched out, and was specially employed by the Hebrews to denote the hemisphere above the earth, compared (Exod. xxiv. 10) to a splendid and pellucid sapphire. Elsewhere (Ez. i. 22–26) it is spoken of as the 'floor' on which the throne of the Most High is placed. Hence it follows that the notions of solidity and expansion were both contained in the Hebrew conception of the

nt. The blue ethereal sky was regarded as a ystal sphere, to which the stars were fixed e the *cælo affixa sidera* of Pliny, ii. 39 ii. 57), and which was constantly revolving, ; them with it. This sphere or firmament 'the waters which were under the fir- from the waters which were above the nt;' and the theory of the phenomena of rain, , that there were 'windows in heaven'— he firmament, through which, when opened, rs that were above the firmament descended. me day were all the fountains of the great oken up, and the windows of heaven were Gen. vii. 11. The view entertained by the and other early nations, was essentially the In the progress of astronomical observations, und that many of the heavenly bodies had lent motions, inconsistent with the notion being fixed to one sphere or firmament. e number of crystalline spheres were inde- increased, each body that was clearly inde- of the rest having one assigned to it, till a system was introduced, capable of being derstood only by the philosophers who it. See PTOLEMAIC SYSTEM. It was long en formed the idea of the possibility of a ing maintained in motion in space without support, and considering the number of na of which the hypothesis of a crystalline nt offered an apparent explanation, we must t as having been in its day a curious and s speculation.

FIRMAN, a word of Persian origin, signifies an nd is used by the Turks to denote any decree emanating from the Ottoman Porte. nt of signing any firman relating to affairs d with his special department is exercised y minister and member of the divan, but e of placing at the head of the firman the a cipher containing the name of the sultan ced letters, and which alone gives effect to ee—is committed to the hands of a special , who is called *nichandji-ghadi*. The name to such decrees as have been signed by the himself is *hatti-sherif*. The name firman o signify a more formal kind of Turkish , which can only be granted by the sultan pasha.—A written permission to trade is India a firman.

FIRST-BORN (Heb. *Bekor*, Gr. *prototokos*, Lat. *itus*), in scriptural use, signifies the first spring, whether of man or of other animals. nciple of the Mosaic law, and indeed of the law of nature, it was established that the of all the produce of creatures, whether or inanimate, were in some sense due to ator as a recognition of His supreme n. See FIRST-FRUITS. Under the title rom this recognition are to be classed many ices regarding the first-born of animate whether rational or irrational, which pre- mong eastern nations generally, or which ally established by the Mosaic law: 1. The n male, whether of men or of animals, was from the time of birth to God. In the first-born male children, the law required hin one month after birth, they should be d by an offering not exceeding in value five of silver (Exod. xiii. 13). If the child died e expiration of thirty days, the obligation of ion ceased; but if that term were completed, gation was not extinguished by the subse- eath of the infant. This redemption took cording to a fixed ceremonial. The first- le of animals also, whether clean or unclean, was equally regarded as devoted to God. The first-born of clean animals, if free from blemish, was to be delivered to the priests within twelve months after birth, to be sacrificed to the Lord (Deut. xv. 21); nor was it permitted to any but the priests to partake of the flesh of such victims (Num. xviii. 18). If the animal were blemished, it was not to be sacrificed, but to be eaten at home (Deut. xv. 22). The first-born of unclean animals, not being a fit subject for sacrifice, was either to be put to death, or to be redeemed with the addition of one-fifth of its value (Lev. xxvii. 27; Num. xviii. 15). If not redeemed, it was to be sold, and the price given to the priests. 2. Primogeniture, both by the patriarchal and by the Mosaic law, had certain privileges attached to it, the chief of which were the headship of the family, and a double portion of the inheritance. Before the time of Moses, however, it was in the power of the father to decide which among all his sons should be considered the first-born. Moses ordained that the right should invariably belong to the first-born in point of time.

Among other nations, considerable variety existed as to the succession of children to the inheritance of their parent. The Greeks, especially the Athenians, excluded the females of a family so rigorously from the inheritance, that in the event of a father dying intestate and without heirs-male of his body, the nearest male kinsman succeeded to the estate. The later Romans, on the contrary, placed daughters on the same footing with sons as to the division of intestate property. The Mohammedans gave the daughters a certain share of the father's estate, but only one-half of that assigned to the sons. All the nations of Germanic descent restricted the succession, especially in land, to heirs-male. But the Visigoths in Spain admitted females, except in certain contingencies.

The rights of the first-born in English and Scotch law are noticed under SUCCESSION, PRIMOGENITURE, &c. In France, the law of primogeniture fell at the Revolution, in common with many other relics of the feudal system. How far the results of the change have been beneficial, is still a moot-question among political economists. In the state of Virginia, also, after the American revolution, a similar change took place; and that the change has been in accordance with public opinion in that state may be inferred from the fact, that a parent now commonly makes, by will, the same disposition of his property as that which would be provided by the law itself in the case of his dying intestate.

FIRST-FRUITS (Heb. *reshith*, Gr. *pro'ogenne-mata* and *aparchai*, Lat. *primitiæ*), that portion of the fruits of the earth and other natural produce, which, by the usage of the Jews and other ancient nations, was offered to God, as an acknowledgment of His supreme dominion, and a thanksgiving for His bounty. Among the Jews, the institution of first-fruits comprised both public and private offerings.

Of the former class, there were three principal offerings: the first was at the opening of the corn-harvest. On the day after the Passover Sabbath, the 16th of the month Nisan, a sheaf of new corn, which was cut and gathered with much solemnity, was carried to the Holy Place, and there waved before the altar (Lev. xxiii. 5 and foll.); nor was it permitted to commence the harvest-work till after this solemn acknowledgment of the gift of fruitfulness. Again, at the Feast of Pentecost, two loaves of leavened bread, made from the flour of the new harvest, were waved, with a similar form of worship, before the altar (Ex. xxxiv. 22). Thirdly, at the Feast of Tabernacles, in the 7th month, was held

the great feast of the gathered-in harvest, the final acknowledgment of the bounty of God in the fruits of the year (xxiii. 16).

Besides these public offerings of first-fruits on the part of the entire people, individual Jews were bound to private offerings, each upon his own behalf. 1. A cake of the first dough of the year was to be offered to the Lord (Num. xv. 21). 2. The 'first of all the fruits' were to be placed in a basket, and carried to the appointed place, where the basket was to be offered with a prescribed form of words, commemorative of the sojourn of Israel in Egypt, and of his deliverance by the strong hand (Deut. xxvi. 2 and foll.). All these offerings were divided into two classes—the first, which were called *Bicurim*, comprised the various kinds of raw produce, of which, although the law seems to contemplate all fruits, seven sorts only were considered by the Jewish doctors to fall under the obligation of first-fruit offering—viz., wheat, barley, grapes, figs, pomegranates, olives, and dates. The law lays down no rule as to the quantity of the first-fruit offering; and it would be tedious to enter into the many questions regarding it which have been raised by the commentators. It was customary for the offerers to make their oblations in companies of twenty-four, and with a singularly striking and effective ceremonial.

The second class of first-fruit offerings were called *Terumoth*, and comprised the produce of the year in the various forms in which it is prepared for human use, as wine, wool, bread, oil, date-honey, dried onions, and cucumbers. As to the quantity of these offerings, and the persons on whom the obligation fell, there are many discussions, for which we must refer to the biblical authorities.

Under the kings, and again after the captivity, much laxity crept into the observance of this practice, which Nehemiah laboured to revive in its primitive exactness. Offerings analogous to the Jewish first-fruits became usual very early in the Christian Church, as is clear from a passage in Irenæus (*Adv. Hær.*, b. iv. c. 17 and 34); but the extent to which it prevailed, and the amount and general character of the oblation, are exceedingly uncertain. It appears to have been merged in the legal provision established by the emperors.

The medieval ecclesiastical impost known under the name of *primitiæ*, or first-fruits, and sometimes of *annates* or *annalia*, was entirely different. By the word, in its medieval and modern sense, is meant a tax imposed by the popes on persons presented directly by the pope to those benefices which, by the canonical rules, or in virtue of privileges claimed by them, fall within the papal patronage. Persons so presented were required to contribute to the Roman see the first-fruits (that is, the income of the first year) of their benefice. During the residence of the popes at Avignon, when the papal necessities compelled the use of every means for eking out a precarious revenue, the impost was sought to be extended to every benefice: and this claim was the subject of many contests, especially in Germany and in England, where the claim, so far as regarded direct papal presentation, had existed from the reign of King John. Henry VIII., by two successive statutes (25 Henry VIII. c. 20, and 26 Henry VIII. c. 3), withdrew the right of first-fruits from the pope, in order to transfer it to the king; and he established a special court for the administration of first-fruits, which, however, was soon disused. In the reign of Anne, the revenues arising from this impost in England were vested in a Board, to be applied for the purpose of supplementing the incomes of small benefices (2 Anne, c. 11). A similar change was introduced in Ireland by the 2 Geo. I. c. 15; but in the latter kingdom the payment was entirely abolished by the 3 and 4 Will. IV. c. 27. In France, this tax was abolished by the 'Pragmatic Sanction' enacted at Bourges in 1438, and subsequently by the *Concordat* of Leo X. with Francis I. in 1512. In Spain, it ceased partially in the reign of Ferdinand and Isabella, and finally under Charles V. In Germany, it formed one of the first among the *Centum Gravamina* presented to the emperor in 1521, and the claim ceased altogether from that period.

FIRTH. See FRITH.

FISCHART, JOHN, a very extraordinary German author, was born either at Mainz or Strasburg, probably about the year 1545. Regarding his life, we know very little. He was by profession a jurist, but his writings exhibit an immense learning and reading in all the departments of human knowledge. About 1570, he made a journey to England. Towards 1580, he was living at Strasburg in terms of close friendship with the eminent book-printer, Bernhard Jobin. During 1581 and 1582, he was advocate to the Imperial Chamber at Speier, and in 1585 became bailiff of Forbach, where he probably died about 1590. Of the very numerous writings which appeared 1570—1590, partly under his own, and partly under various fictitious names, about fifty have been proved to be on the whole genuine, though disfigured by interpolations. In respect to others, however, the authorship is doubtful. The original editions of almost all F.'s works are extremely rare, but new ones have recently been published. His most celebrated works are based on foreign models, particularly Rabelais, but there is no servile imitation manifested: a free creative genius works plastically on the materials. To this class belong his *Aller Praktik Grossmutter* (1573), *Assentheurlich Naupengehörliche Geschichtklitterung von U. S. W.* (1575), *Podagrammisch Trostbüchlein* (1577), *Binenkorb des Heyl. Römischen Imenschwarms* (1579), and *Der Heilig Brotkorb* (1580). These writings are wholly satirical. With the most inexhaustible humour, he lashes, now the corruptions of the clergy, now the astrological fancies, the dull pedantry, or other follies, public and private, of the time. Next to these stands the outrageously comic work of F.'s—quite original in its conception—entitled *Flöhatz, Weibertratz* (1574). Essentially different in its homely and simple tone is his *Das glückhafft Schiff von Zürich*, written in verse, and published in 1576 (new edition by Halling, 1829). Similar in point of style are his *Psalmen und Geistliche Lieder* (1576; new edit. Berlin, 1849). The rest of F.'s numerous writings, partly in prose, partly in verse, are of unequal merit, singularly varied in style and contents; the prose works being in general more complete than the poetic. What gives so high a value to F.'s satirical humour, is the warm and genuine feeling which he exhibits for the moral foundations of all public and private life—viz., religion, 'fatherland,' and the family, a feeling which betrays itself in his wildest mirth. His works are, moreover, one of the richest sources from whence to draw information with regard to the manners of his time. But perhaps the most extraordinary thing about F. is his treatment of the language. No German author can be compared with him, not even Jean Paul Richter himself. He coins new words and turns of expression, without any regard to analogy, but nevertheless displays the greatest fancy, wit, and erudition in his most arbitrary formations. The fullest collection of his writings is in the Royal Library at Berlin. For a critical account of the investigations concerning

works, see Volmar in Ersch and Gruber's die (s. 1, vol. 5).

a naval term of various application. RIES. The capture of various kinds of e purpose of trade has always been exten- ied on in maritime countries, and in those watered by large rivers; and has been in many instances of adding greatly to perity. In Great Britain and Ireland, this pursuit affords remunerative employ- large proportion of the population, and unequalled nursery for sailors to recruit the .

of capturing fish, like other arts, has been nly by degrees to its present perfection. ages, fish were caught in the rudest y men who lay on the rocks, ready to m with arrows, or transfix them with spears. Even yet, in places which are only partly civilised, fish are taken with blankets or sheep-skins; and a roughly made spear, known as a leister, is still used in the country districts of the United Kingdom in the illegal capture of salmon. Advancing intelligence, however, and the use of fish as an article of barter for other kinds of food, soon led to more effective modes of capture. Persons who dwelt on the sea-coast began to exchange fish for animal food killed by the inland hunters, and in this way initiated a commerce which is now represented by a vast amount of capital and enterprise.

The importance of fisheries, as bearing on the food-supplies of nations, inland as well as maritime, and as forming a remunerative outlet for labour, can scarcely be overestimated, more especially as fish has ever been in the greatest demand by all classes of the people, and has been in use for human food from the most remote periods. Previous to the Reformation, it was in universal demand in Britain, being the prescribed diet during the fasts appointed by the church.

One great peculiarity of this source of wealth is that, with slight exceptions, the sea-harvest (if we may so call it) is ripened, without trouble or expense for the fisher, who only requires to provide the means of gathering it; and that, under certain regulations, it is free to all comers. River fisheries, except in the case of salmon, are, so far as commerce is concerned, comparatively unproductive in Great Britain; and Lochleven is the only British fresh-water lake the produce of which is worth mentioning. But the great continental rivers abound in excellent fish, which in the aggregate are of very considerable value.

The principal fisheries of Great Britain are those connected with the capture of salmon, herring, shell-fish, cod, soles, turbot, mackerel, &c. Immense quantities of these fish are in constant demand, and the various lines of railway, that branch inland from the coast, afford a rapid means of transit, and have in consequence considerably enhanced the value of sea-produce, which in former years was lost for want of a sufficiently rapid conveyance to those seats of population where it would have found a ready sale. In fact, it is affirmed by those who have studied the subject, that the increased demand for fish, consequent upon the increased facilities for its transit, has so affected the fisheries as to render them less productive than formerly, when the demand was more limited.

It is difficult to obtain reliable statistics of the different fisheries, as, excepting the government Board for Scotland, there is no recognised authority on the subject. The following figures, bearing on the herring-fisheries of Scotland, which are the most important of the fisheries of the United Kingdom, are taken from official returns made by the commissioners for the fishing of 1860. The total quantity of herrings cured during that year was 681,193¼ barrels; the total quantity branded, 231,913½ barrels; and the total quantity exported, 377,970½ barrels; being an increase over the preceding year of 189,706 barrels in the quantity cured, of 73,237½ in the quantity branded, and of 104,991 in the quantity exported. From the fishery statistic accounts, we find that, in the year 1860, 12,721 boats, manned by 42,430 fishermen and boys, were engaged in the herring, cod, and ling fisheries of Scotland and the Isle of Man; and that the total estimated value of the boats, nets, and lines employed in these fisheries during the same period was £750,196. The greater portion of the herrings are salted or cured, and in this state they are sold in very large quantities, not only in Great Britain, but

in her colonies and in other foreign countries. At Hamburg and other continental seaports, there are merchants who deal largely in cured herrings, and employ agents to visit the various British ports, in order to secure a supply. Accurate statistics of the quantity of herrings which is annually cured in Scotland may be consulted in the various returns of the Fishery Board. The following figures represent the number of barrels cured annually for the last ten years: 1852, 498,788; 1853, 710,344; 1854, 636,532; 1855, 766,703; 1856, 580,000; 1857, 550,000; 1858, 630,000; 1859, 500,000; 1860, 637,000; 1861 (supposed), 680,000.

The principal seats of the herring-fishery in Great Britain are at Wick, in Caithness-shire, Scotland, and at Yarmouth, in England; but it is also carried on in many places along the coast. The annual consumption of herrings in London will give a good idea of the total quantity of that fish required for general consumption throughout the kingdom. Upwards of 300,000 barrels of fresh herrings, of 700 fish to each barrel, are annually used in the great metropolis, 265,000 baskets of bloaters, of 150 fish per basket, and not less than 60,000,000 of red herrings. Large quantities of the pilchard and of the sprat are also consumed, the annual value of the latter being estimated at upwards of £100,000.

A visit to Billingsgate affords the best means of obtaining a proper notion of the food-wealth of the sea. Here tons upon tons of all kinds of fish are daily distributed. The average quantities per annum of white fish estimated to have passed through Billingsgate in the course of the last five years are as follows: Haddocks, 3,000,000; whitings, 18,500,000; soles, 100,000,000; cod, 500,000; plaice, 35,500,000; mackerel, 25,000,000. So great is the demand for white fish throughout the kingdom, that many fishermen run as far north as the Orkneys to obtain them; and welled vessels in 1861 tried the experiment of carrying live cod all the way from Rockall, a very distant fishery (situated in lat. 57° 35′ N., and long. 13° 40′ W.), where there is an abundant supply of large fish, such as cod, but hitherto with little success. One vessel took on board forty score of live cod at this dépôt, but on arriving at Great Grimsby only three score of these were found to be alive, for which a sum of £24 was obtained. Most of the cod-smacks carry their cargo alive as far as Gravesend; but they dare not venture further up the Thames, as the fish would not live in its foul waters. The Irish seas are famed for the fine quality of their white fish; the haddocks of Dublin, in particular, have a great reputation. In Scotland, a vast proportion of the haddocks are slightly smoked, and sold as 'Finnans,' which form a well-known breakfast delicacy in all parts of the country. Large quantities of cod and ling are caught, split up, and sold in a dried state.

The most valuable white fish, individually considered, is the aldermanic turbot, which brings a high price. Eels are also caught in large quantities at all seasons, and fetch a remunerative price in the London fish-markets. With reference to cod and ling, the annual returns published by the Board of Fisheries in Scotland shew that, in the year 1860, 115,688 cwt. were cured dried, and 4339½ barrels cured in pickle; and that the total quantity exported was 32,221 cwt. cured dried.

As regards crustaceans and shell-fish, Mr Mayhew, in one of his elaborate works on London, states their annual consumption as follows: Oysters, 495,896,000; lobsters (averaging 1 lb. each), 1,200,000; crabs (averaging 1 lb. each), 600,000; shrimps (324 to a pint), 498,428,648; whelks (227 to half-bushel), 4,943,200; mussels (1000 to half-bushel), 50,400,000; cockles (2000 to half-bushel), 67,392,000; periwinkles (4000 to half-bushel), 304,000,000. These numbers are applicable to a bygone time, and would require to be considerably augmented to represent the present consumption of these delicacies in London. This branch of the trade represents, according to some economists, an annual sum of about £300,000. The lobster, being by far the most valuable of the crustacean kind, is most assiduously nursed in ponds, so as always to be ready for market. Mr Scovell of Hamble, near Southampton, keeps a thousand or two always on hand, and steam-vessels are employed to bring them alive from the most distant parts of the coast: these boats are built exclusively for this purpose, and have immense wells in them to hold the living freight. The lobsters are not at once brought to London, but are kept ready in perforated boxes, on the Essex side of the Thames, to answer the demand as it arises. Norway supplies at least two-thirds of our lobsters. Mr Saunders, the extensive lobster salesman of Lower Thames Street, used to estimate the daily consumption of lobsters in Great Britain at 40,000. There is also an enormous demand for oysters, and a considerable proportion of our maritime population earn a comfortable livelihood by breeding and dredging them. At Whitstable, in Kent, and at various places in Essex, there are dépôts for breeding and storing oysters. The 'spat' is procured and grown in the course of four years into a marketable commodity of much value. The Whitstable Oyster Company received for oysters, in 1859, the sum of £62,000; £50,000 of this sum being for native, and £12,000 for other kinds of oysters. The oyster is found in great abundance on the British coasts, there being famous fisheries for it both in Scotland and Ireland. In America, and other countries also, it is a common mollusc. See OYSTER.

Whilst sea-fisheries are open to all who have the means of working them, salmon-rivers are for the most part private property. The owners of particular streams usually form themselves into an association chiefly for the protection of the fish during the spawning season. The usual method is for the 'lairds' to let their fishings to tenants, who are called 'tacksmen,' and whose interest it is to capture and sell all the fish they can find. The rents obtained are, in some instances, very large, and form a handsome addition to the land-revenues of the proprietors. Before the invention of packing in ice, and previous to the introduction of steam-boats and railways, salmon used to be sold in the markets at the price of two-pence per pound. When the increased demand for it, created by these facilities of conveyance, caused it to attain its present price, tacksmen were tempted to overfish their streams, and the consequence has been the exhaustion of particular rivers. An elaborate report on the state of the English salmon-fisheries, presented to parliament in 1861, contains ample proofs of the universal falling off in the rivers of England and Wales. It is intended, however, under the auspices of the commissioners of the English salmon-fisheries, to take active steps to have them re-peopled with fish. The Scotch and Irish salmon-fisheries have also suffered from the effects of overfishing, and various legislative measures and other means have of late years been tried with a view to avert the extermination of this valuable fish. See SALMON, PISCICULTURE.

The following statement of the number of boxes of salmon received in London for the ten years ending in 1860, will afford an index to the value of the British salmon-fisheries. Each box contained

is impossible, from the paucity of reliable ıation, to do more than roughly estimate the ıt of capital employed in the British fisheries, : value of the stock of boats, nets, and other ments of capture. However, it is certain that ınual value of the produce of British fisheries kinds is not less than £5,000,000.

food-fisheries of France are now becoming ensive with those of Britain, so far as the e of sea-fish and crustaceans are concerned; . the cultivation of those less important fishes thrive best in lakes, canals, and rivers, xcel us, for while we only cultivate these for ses of amusement (see ANGLING), the French make them an article of commerce, and large sums of money from their sale. At me, the whole fresh-water fisheries belonging ance were not of so much value as one of almon streams; but by means of artificial ation and careful nursing, they have been increased in value, and, by the care of the ıment, are being yearly extended. The fresh- fisheries of France are of great extent, of the fishponds in that country extending wards of thirty thousand acres. According official summary of the value of the fresh- fisheries of France, dated 1860, the state ses the right of fishing over 8135 miles of and water-courses; and individual proprie- ercise similar rights over 930 miles of canals vers, 114,889 miles of small water-courses, and 0 acres of lakes and ponds. In Paris, the consumption of fish gives for each individual n estimate of 27 lb. of sea-fish, and $\frac{1}{5}$ lb. of water fish.

ng the other foreign fisheries most worthy ice are the river-fisheries of Germany, where ulture of the Danube salmon and other water fish is assiduously carried on. In the erranean, various kinds of fish are taken, the greatest value being the tunny. The anchovy ardine are also taken in large quantities. ount of the great eel-fishery at the mouth Po, on the Adriatic, has already been given s work. See COMACCHIO. The Dutch are as rious upon the sea as they were at the time they founded Amsterdam, and a large pro- n of the population of Holland are engaged in fisheries, which are still a source of wealth at kingdom, particularly the herring-fishery, engages about twenty thousand people. Norwegian fisheries afford large quantities of rs and turbots, while from Newfoundland is d a plentiful supply of cod or ling. The oundland fisheries, which are principally for have existed for upwards of three centuries. rancis Drake was the first person who fished on behalf of England, and the fish he sent soon excited a spirit of enterprise in the country, which led to the dispatch of a large number of ships and the extension of the fishery. The island is surrounded by the cod-banks, and the capture and cure of this fish form the staple occupation of the people. See NEWFOUNDLAND.

The oil-fisheries are not now so important as they were at one time, the invention of gas and the discovery of other lubricants having rendered us independent of whale oil. The success of the whale-fisheries has also fluctuated so much as to prevent modern capitalists from embarking very largely in the trade. The only novelties that distinguish the whale-fishery of the present day are the introduction of steam-whalers, and, in some instances, of vessels wintering in Greenland; but, with all these advantages, our whalers barely pay their expenses, and the fishery, as compared with former years, exhibits a considerable falling-off. In the year 1814, the total catch of the British ships engaged in the fishery, 143 in number, was 20,000 tuns, and in the following year, the Hull ships alone had 7987 tuns, exclusive of black oil. The series of years from 1813 to 1830 were remarkably prosperous, there being scarcely a broken season in the whole of that period. Formerly, London sent out a whaling fleet of twenty ships, and the Hull squadron in 1807 amounted to sixty-three vessels. The total whaling fleet numbered at one time 159 ships, but to-day it barely amounts to a tenth of that number. The seal is now largely captured for the purpose of obtaining its oil. See WHALE, CACHOLOT, SEAL, GREENLAND, &c. The South-Sea or sperm-whale fishery is principally in the hands of the Americans, who pursue this branch of commerce most successfully. The quantity of sperm-oil yielded by the fishing of 1861 was 68,932 barrels, or nearly 7000 tuns.

FISHERIES, LAWS REGARDING. As it is quite impossible, within the limits of the present work, to give any detailed account of the provisions which the legislature have introduced for the purpose of promoting and protecting our fisheries, we shall content ourselves with pointing out the principal objects which our policy has had in view with reference to this very important subject.

1. From a very early time, statutes have been passed both in England and Scotland, for the purpose of protecting the breeding of fish, and preventing the destruction of the spawn or fry. Of these the first in the statute book is 13 Edw. I. s. l. c. 47, and the latest, 14 and 15 Vict. c. 26.

2. A feeling of the interest which the whole community has in the development of the fisheries, has led to a system of advancing public moneys for their encouragement; for this purpose, commissioners have been appointed, through whom money is advanced on loan. The last act having this object in view is 19 and 20 Vict. c. 17.

3. Bounties were formerly paid upon the taking and curing of fish of various descriptions, and on the vessels employed in various branches of the fisheries; but this method of encouraging the fisheries has been abandoned. The last statute relating to this subject is 7 Geo. IV. c. 34.

4. A treaty was entered into in 1839 between her Majesty and the late King of the French, and carried into effect by act of parliament (6 and 7 Vict. c. 79, amended by 18 and 19 Vict. c. 101), concerning the fisheries in the seas between the British Islands and France. By this convention, the limits within which the general right of fishing is exclusively reserved to the subjects of the two kingdoms respectively, are fixed at three miles' distance from low-water mark. With respect to bays, the mouths of which do not exceed ten miles in width, the three-mile distance is measured

from a straight line drawn from headland to headland.

5. In 1854, a similar treaty was concluded between her Majesty and the United States of America, relating, *inter alia*, to the rights of fishery between the British colonies in North America and the United States. This treaty was carried into effect by 18 and 19 Vict. c. 3.

6. The trade in fish, as regards the cities of London and Westminster, is regulated by acts of parliament, the chief objects of which are to secure a supply of fresh fish, and to prevent forestalling of the same. The first of these acts is 22 Geo. II. c. 49, and the last 4 and 5 Will. IV. c. 20.

7. Fresh fish of British taking, imported in British bottoms, may be landed without report or entry, under 16 and 17 Vict. c. 107, s. 49.

8. Persons employed in the fisheries, in such manner and under such circumstances as are laid down in 50 Geo. III. c. 108, are exempted from impressment.

9. The fisheries of Ireland are regulated by recent acts, of which the earliest is 6 and 7 Vict. c. 108, and the latest 13 and 14 Vict. c. 88.

10. By the Scotch Act 21 and 22 Vict. c. 69, fees are imposed on the branding of barrels under the acts concerning the herring-fisheries. See HERRINGS, SALMON, &c.

FISHES, ROYAL—i. e., those which at common law are the property of the crown—are the whale and the sturgeon, when either thrown on shore, or caught near the coast. The ground of the privilege is said to have been the superior value of these fishes. They were considered too precious for a subject, just as the Swan (q. v.), which was a royal bird, was too good for any table but the king's. 'Our ancestors,' says Blackstone, 'seem to have entertained a very high notion of the importance of this right, it being the prerogative of the kings of Denmark and the dukes of Normandy; and from one of these it was probably derived to our princes. It is expressly claimed and allowed in the statute *De Prærogativa Regis* (17 Edw. II. c. 11), and the most ancient treatises of law now extant make mention of it.'—Stephen's *Com.* ii. p. 547. Strictly, it was the head only of the whale which belonged to the king, the tail being a perquisite of the queen-consort (*Ib.* p. 457). In Scotland, whales thrown on shore above six horse-power draught, belong to the queen or her donatary, the admiral. Smaller whales have been claimed both by the landlord and the tenant on whose ground they are cast, but they are usually given to the catcher. In Shetland, where the washing of whales on shore is an occurrence of sufficient frequency to have given rise to a local custom, they are equally divided between the proprietor of the soil and those concerned in catching them. See SALMON.

FISHES (*Pisces*), the fourth—or, according to Milne-Edwards and some other naturalists (see AMPHIBIA), the fifth—class of vertebrated animals; consisting of creatures which live in water, and accordingly breathe by gills (*branchiæ*), and not, at any stage of their existence, by lungs. In number—both of individuals and of different kinds—they are supposed to exceed all the other classes of vertebrate animals put together. Even the water of hot springs and the pools of caverns have their peculiar fishes, and some of these are only known as thrown out with torrents of muddy water by volcanoes.

The form of fishes is generally adapted to easy and rapid progression through water, being more or less nearly that of a spindle, swelling in the middle, and tapering towards the extremities; the outline unangular, and the surface smooth. But exceptions to this rule are numerous; and some, provided with other means of seeking their food, or of preservation from their enemies, exhibit the greatest possible departures from the ordinary shape: some are globe-shaped, some have a most irregular and angular outline, many are much elongated, as eels; and others are compressed and flattened, as flounders.

The bones of fishes differ much in their structure from those of other vertebrate animals: they are less dense and compact, and when their ossification is perfect, remain separate, as in the early embryotic state of the *Mammalia*. The bones of the sub-class of Cartilaginous Fishes (q. v.), however, never become properly ossified. The bones of fishes generally contain a smaller proportion

Skeleton of Perch.

of earthy matter than those of other vertebrate animals, and their cartilaginous basis contains no gelatine strictly so called. The typical character of the vertebrate skeleton is, however, maintained, although modified; and many of the bones—a great majority, for example, of those of the head—are evidently homologous with those of quadrupeds and of man. There is no neck, and the vertebræ are distinguishable only into abdominal and caudal. The vertebræ are concave at each end, and pierced in the middle, the hollow space being occupied with a gelatinous substance. Spinous processes, sometimes short, sometimes long, extend upwards and downwards from the vertebræ to support the muscles. Fishes also generally have ribs, connected with the abdominal vertebræ; and in many, an additional set of small bones (*epipleural spines*) connected with the ribs, and arising from near the base of the ribs, extends outwards and backwards through the lateral muscles. The four limbs which belong to the typical structure of vertebrate animals, assume in fishes the form of *Fins* (q. v.), and are generally, although not always, all present, the first pair being the *pectoral*, the second pair the *ventral* fins. In some fishes, the ventral fins, answering to the hind-feet of quadrupeds, are actually further forward than the pectoral fins, and are then called *jugular* fins. In some, as the common eel, the ventral fins are wanting; in some, as the *Murænæ*, there are neither pectoral nor ventral fins. Connected with these fins are bones, which shew that they represent the limbs of other vertebrate animals. Fishes have, however, also other fins not so closely connected as these with the internal (*endo-*) skeleton, and not placed like them in pairs towards the sides, but vertically on the middle (*mesial*) line; one or more (*dorsal*) on the back; one or more (*anal*) on the opposite or ventral aspect, behind the anus; and one (*caudal*) at the extremity of the tail. The caudal fin is in general the principal organ of locomotion, and most of the muscles of the body combine to give great energy to its strokes, great part of the body moving with it, and the vertebræ with their processes being so framed as to admit great freedom of lateral, and scarcely any vertical motion. The pectoral and

s seem to serve chiefly for balancing the guiding and staying its motion; the dorsal ins, like the keel of a ship, for keeping roper position. All the vertical fins are by bones which do not join those of the :eleton, but are thickest at the skin, from y penetrate towards the vertebræ, being between the spinous processes of the column. Several of the last caudal re generally very short and combined, and osed spines which support the caudal fin owards them. The *rays* of fins are either nes (spines)—sometimes prolonged beyond rane, and forming defensive weapons—or :artilaginous and jointed, in which case ı also branch near their summit. The never has any other than these soft rays, fishes have no other in any of their fins. ies, belonging to different families, have ıl fins developed to an unusual degree, so : them capable of supporting short flights see FLYING FISH and FLYING GURNARD); are capable of employing their fins as ocomotion in a very different way, creeping ground, or hopping among the weeds and he shore.

rt of fishes consists only of one auricle and :le, receiving venous blood only, and sending gills, where, being oxygenated, it passes eater or systemic circulation by the dorsal e CIRCULATION. In most fishes, there is, e heart, a thick *bulb* or muscular swelling t artery which conveys the blood from the he gills, and which assists in propelling being furnished with valves to prevent tation into the heart; and this bulb and exhibit varieties admirably characteristic t natural groups, much founded upon in n of Müller and Owen. The blood of d; its corpuscles are oval and of consider- ut in general not very numerous. Fishes

Cheironectes Caudimaculatus.

ittle oxygen in respiration, and are *cold-* imals, having in general a temperature ated above that of the water in which although there are some singular excep- his rule, as the tunny, sword-fish, &c., ving a comparatively high temperature, redder blood with more numerous cor- The oxygen appropriated by means of the piration is not obtained by decomposition but from the air which is mixed in it, : the necessity of aërating an aquarium; hence also we perceive one of the benefits resulting from the agitation of the ocean and of lakes by winds. Some fishes require a greater supply of air than they can easily obtain from the water, and frequently come to the surface to breathe. Fishes taken out of the water die from want of breath, in consequence of the drying up of the fine fringes of the gills; and those which are capable of subsisting longer out of water than others, have generally small gill openings, not so freely admitting the air to dry the gills, whilst a few are provided with receptacles for water to keep them moist. See ANABASIDÆ.

The gills of fishes are situated at the back part of the sides of the head, and consist of a multitude of very vascular membranous plates, which are generally in double fringe-like rows fixed by the base only, and simple, although in a few fishes they are feathery, and in the greater number of *Cartilaginous Fishes* (q. v.), they are fixed both by their external and their internal edges, or consist of mere folds of membrane attached to the surface of the gill-cavities. In general, there are four gills on each side; the number is greater in some of the Cartilaginous Fishes. In Osseous Fishes, the gill-plates are attached to the external edge of the branchial arches, bony arches connected with the *hyoid bone* or bone of the tongue—which is unusually developed in fishes—and with the base of the skull, the connection at both ends being effected by intervening small bones, and the whole forming a complicated system; whilst the cavity containing the gills, on each side of the head, is covered by a bony plate, the gill-lid, gill-cover, or *operculum*, with two subordinate pieces, called the *sub-operculum* and *inter-operculum*, articulated on the temporal bone, and playing on the *pre-operculum*, a bony plate placed before them in the head. It is by the motion of these bony plates that the water is expelled which is taken in by the mouth, and which, after passing amongst the gills, and supplying them with air, passes out by the gill-orifices at the back of the head. Besides these opercular plates or bones, a series of flattened rays, connecting them with the bone of the tongue, and called the *branchiostegal rays*, aid in forming the gill cavities. In the branchiostegal rays, distinctive characters of fishes are often found.

The brain of fishes differs very considerably from that of other vertebrate animals. See BRAIN. In general, they possess the nerves and organs of all the senses, although the senses of touch and taste are commonly supposed to be more dull than in many other animals; and a few fishes, living chiefly in mud, or in the waters of caverns, are destitute of eyes, and consequently of sight, although even they possess optic nerves, and seem sensitive to light. But in most of them, the eyes are large, and vision is evidently very acute; and some have cirri or barbules near the mouth, filaments proceeding from some of the fin-rays, &c., which are regarded as delicate organs of touch, adapted to the wants and habits of the particular species. The eyes are covered by the skin, modified in its character, and have no eyelids nor nictitating membrane. They are very variously placed in different kinds. There is no external ear.

The mouth is the only organ of prehension. It is very different in different kinds—sometimes very small, sometimes extremely large, sometimes forming a sucker by which the fish can both fix itself and pump up the fluids of the animal on which it preys. The snout is also abbreviated, prolonged, or otherwise modified in very various ways. The teeth are far more various in form, number, position, and structure, than in any other class of animals. They never have any roots, but are fixed to the bones

which support them; they fall off, however, and are replaced. Some fishes have no teeth; some have very small teeth; some have teeth in great number, but so fine as to resemble the hairs of a brush; some have short thick teeth; some have long sharp teeth, either straight or crooked; some have teeth so flat and closely set that they resemble a regular and beautiful pavement; and the teeth of fishes are sometimes situated not only on the jawbones, but on the *vomer* or bone extending along the middle of the roof of the mouth, and indeed, also, on other parts of the palate to the very throat, and very commonly on the tongue. The food of fishes is various: a few subsist on vegetable food of different kinds, but most of them on animal food, of which there is no kind that does not seem to be particularly agreeable to some of them, from the mere animalcule or the most minute crustacean to the flesh of the mammalia. In general, they are excessively voracious, and seem to spend most of their lives in seeking food. Many of them prey on other fishes, and many seem equally willing to devour other species or the younger and weaker of their own. Some of them swallow their food almost or absolutely alive; others subject it to processes of comminution, trituration, and mastication in the mouth. Salivary glands are not found in fishes, although they exist in some of the vertebrate animals. The digestive process seems to be performed very rapidly. The stomach and intestines vary very much in different kinds. The kidneys are in general extremely large, extending through the whole length of the abdomen.

The *air-bladder* is found in many fishes, but not in all; and is present or absent in different fishes even of the same genus or family. See AIR-BLADDER. Its uses, and its connection with the habits of particular species, have as yet been but partially ascertained.

Fishes are oviparous (egg-producing); a few are ovoviviparous (eggs hatched within the body, and young produced alive). The chief reproductive organs are generally two elongated lobes of a fatty substance, *milt*, in the males, and of rudimentary eggs, *roe*, in the females. Impregnation usually takes place after the *roe* or *spawn* is deposited, the male accompanying the female to the place of spawning. In some Cartilaginous Fishes, it takes place before the deposition of the eggs; and male sharks and rays are furnished with organs called *claspers*, the use of which is well indicated by the name. The fecundity of fishes is generally very great, and their eggs very small in proportion to the size which they ultimately attain, although this is not so much the case in the Cartilaginous Fishes already mentioned. Some of the fishes most valuable to man, as the salmon, herring, and cod, are remarkable for their fecundity. Nine millions of eggs have, according to Leuwenhoek, been ascertained to exist in the roe of a single cod; and provision is thus made both for the preservation of the species amidst all the dangers to which the spawn and the young are exposed, and for the wants of man. The spawn of fishes is deposited in very different situations, according to the different kinds—as by some on aquatic plants, by some on beds of sand or gravel; but many species leave the depths of the ocean in order to deposit it in shallower waters, and some, usually marine, ascend rivers for this purpose. Very few fishes take any care of their eggs or young; but there are remarkable exceptions to this rule, and some of the gobies and sticklebacks are known to tend their young with great care. Sticklebacks also construct nests. See STICKLEBACK. It is not long since this curious fact was discovered, although these little fishes have been so long familiarly known; and it is therefore not improbable that many other fishes may have the same habit.

The growth of fishes is very rapid when supplies of food are abundant, but becomes slow in less favourable circumstances, or is arrested for a long time, in a manner to which there seems to be nothing similar among other vertebrate animals.

The skin of fishes is generally covered with Scales (q. v.), which, however, are sometimes minute and imbedded in the skin, and sometimes altogether wanting. The scales are either horny or bony, and are generally imbricated, like the slates of a roof, their free ends backwards; but sometimes form bony plates, fixed by the whole of their lower surface. They usually exhibit beautiful symmetrical markings and inequalities of surface of various kinds, and in some are covered with a thick coat of enamel. The differences of character in the scales have been made the foundation of a classification of fishes by Agassiz, by whom all fishes are distributed into the four orders of *Cycloid*, *Ctenoid*, *Placoid*, and *Ganoid Fishes* (see these heads), having respectively cycloid, ctenoid, placoid, and ganoid scales; a classification which has been found particularly convenient with reference to fossil fishes, although other systems maintain their ground against it as preferable for recent species. It is not, however, wholly artificial, for a relation can be very generally traced between the character of the scales and the general structure and economy of a fish.

The scales of a row extending from the head to or towards the tail on each side of the body of Osseous fishes in a somewhat waved line, called the *lateral line*, are pierced for the transmission of a slimy matter, with which the whole body is lubricated.

The colours of fishes depend upon a substance consisting of small polished laminæ, secreted by the skin.

As fishes need no covering, like fur or feathers, to prevent the dissipation of their animal heat in the surrounding medium, their scales must be regarded chiefly as defensive armour. Some of them are also defended by large bony plates, which are either on the head alone or also on the body, and some by spines connected with the fins, gill-covers, &c. Few have any other offensive weapons than their teeth, but the spine attached to the tail of some rays is a remarkable exception, as is also the elongated snout or beak of the sword-fish, saw-fish, and a few others. But a much more remarkable kind of armour—probably both offensive and defensive—is possessed by a few fishes, in an electrical apparatus, by which they can give severe shocks. It is also an interesting fact, that the electrical apparatus is quite different in different fishes possessing it, the Gymnotus or Electric Eel, the Torpedo, and the Electric Silurus or Malapterurus. See ELECTRICITY, ANIMAL.

Many fishes are gregarious, swimming in shoals, which in some species consist of immense multitudes. Some also make periodic migrations; salmon, for example, ascending our rivers, and herrings and pilchards visiting our coasts, but the long migration formerly ascribed to these fishes is now doubted or disbelieved. The occasional overland migrations of eels, and the more frequent overland migrations of some tropical fishes, cannot but be regarded with peculiar interest; and the instinct is very wonderful by which, when fleeing from a pool that is about to be dried up, they direct their course towards a place where water is more abundant. This faculty is, however, rare, although possessed by tropical fishes both of the eastern and western hemispheres; but more generally the fishes destined to inhabit tropical ponds which are liable

[redacted]ried up, are capable of living dormant, [redacted]d in the mud, till they are liberated again [redacted]rains, when they reappear in their former [redacted]ea.

[redacted]e uses of fishes to man, by far the most [redacted]at is that of supplying him with food. [redacted]orm an article of food in almost all coun- [redacted]d in some a principal part of the food of [redacted]abitants. Many fishes are highly esteemed [redacted] table, which are not procured in sufficient [redacted]ice to be a principal part of food in any [redacted]. Some fishes, on the contrary, are unpala- [redacted]and some, mostly tropical, are poisonous, [redacted]thers are poisonous only at particular sea- [redacted]The skin of some Cartilaginous Fishes yields [redacted]EN (q. v.), and the air-bladder of some fishes [redacted]ISINGLASS (q. v.). The minute laminæ which [redacted]lliancy of colour to some, and the similar [redacted]e found in the air-bladder of others, afford [redacted]erials of which artificial pearls are made. [redacted]eful for lamps is obtained from a number [redacted]s, and the medicinal value of cod-liver oil [redacted]ell known.

[redacted]lassification of fishes most generally adopted [redacted] of Cuvier, who divides them into OSSEOUS (having true bones), and CARTILAGINOUS (q. v.); and divides Osseous Fishes into [redacted]pterous Fishes (*Acanthopterygii*, q. v.), and [redacted]terous Fishes (*Malacopterygii*, q. v.). The [redacted] of Agassiz has already been noticed. That [redacted]r and Owen differs from both.

Fishes.—The medium in which fishes live, [redacted]hard and almost indestructible nature of [redacted]ortions of their skeletons—as their teeth, [redacted]nd scales—would lead us to anticipate their [redacted] occurrence in the Sedimentary rocks; but [redacted]h as the soft parts of the animal are liable [redacted]ly decomposition, the remains of fish must [redacted]tist in a fragmentary and scattered con- [redacted]Thus, the teeth in the shark, the spine [redacted]in the sting ray, and the scales in the bony [redacted]uld survive the total destruction of the [redacted]nous skeleton as well as the soft portions [redacted] fish, and would alone remain to testify to [redacted]istence.

[redacted]earliest ichthyc remains are of this frag- [redacted] character. They have been obtained from [redacted]llow rock,' a member of the Upper Silurian [redacted]nd consist of spines and portions of skin, [redacted]e been thickly covered with hard tubercles [redacted]kles, like the shagreen of the shark's skin. [redacted]nes most nearly resemble the dorsal spine [redacted] dogfish; they are small, flattened, and [redacted]curved. Along with other similar frag- [redacted]remains, they have been placed under the [redacted]at indefinite generic title *Onchus*.

[redacted]minute, compressed, conical, and glistening [redacted]alled *Conodonts*, obtained in great numbers [redacted]e Lower Silurian measures in Russia, and [redacted]ed by their describer, Pander, to have been [redacted]n of fishes, belong certainly to very different [redacted] Their small size and peculiar forms, and [redacted]re margin of the hollow base by which [redacted]re attached, shew them to have been the [redacted]n from the lingual ribbon of shell-less [redacted], which have left no other traces of their [redacted]e than these remarkable Conodonts.

[redacted]udlow bone-bed contains the earliest noticed [redacted]ains. No idea of the numerical importance [redacted] at this early period can be satisfactorily [redacted] yet these remains being confined to a single [redacted], and occurring rarely even in that, would [redacted] indicate that the Silurian seas were but [redacted]nanted by these earliest sharks.

[redacted]e immediately succeeding Devonian rocks, [redacted]mbers largely increased. The ichthyo- dorulites, or fossil spines of this period, have been referred to fourteen different genera. Numerous species of true ganoids have been determined from their well-preserved enamel scales, which occur singly or in confused groups, and frequently also associated with the head, fins, and tail, so as to present a faithful 'nature-print' of the fish upon the rock. See DIPTERUS, DIPLACANTHUS, &c. But the most remarkable and characteristic fossils of this period are the Buckler-fishes, whose head and part of their body were covered with bony plates, giving them so singular and anomalous an appearance, that some of them were originally considered crustacean. They are almost confined to the Old Red Sandstone series, a single species (found in Permian strata) being the only cephalaspid that is known later. See CEPHALASPIS, COCCOSTEUS, PTERICHTHYS, &c.

Fish remains are of frequent occurrence in the Coal-measures. Upwards of twenty species of plagiostomous fishes have been determined from the spine defences, some of which are very large and powerful. The frequency with which the peculiar teeth of the cestracionts are met, shew that they must have been common in the carboniferous seas. Ganoids were also abundant. See PALÆONISCUS, HOLOPTYCHIUS, &c.

In the Permian period, the forms are similar to what exist in the older strata. Up to the last Permian deposit, the fish have all possessed heterocercal tails; but with the Secondary rocks, the homocercal tail not only appears, but becomes the more frequent form.

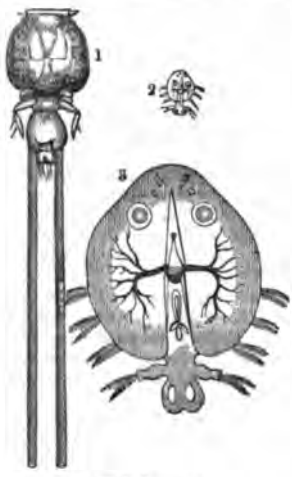
Numerous species and many new forms appear in the Trias and Oolite. Sharks are remarkably abundant in the Cretaceous strata; but the Chalk is specially remarkable from containing the earliest discovered remains of the true bone-fishes—those covered with ctenoid and cycloid scales.

In the Tertiary strata, the character and proportion of ichthyc remains exhibit a condition in the inhabitants of the water very similar to what at present prevails. The cartilaginous orders decrease, and are replaced by osseous fishes, such as the salmon, cod, turbot, and herring—fishes which are of much greater value to man than those they superseded.

FISH-HOOKS. A considerable amount of skill is required for the successful manufacture of these simple articles. There are two kinds in the market, the English and the Limerick fish-hooks, the latter are in the highest repute among anglers. The English fish-hooks are made chiefly at Redditch, in Worcestershire. Steel-wire is cut into the required lengths, and softened; then the ends of three of these are inserted into shallow holes of a sort of rest or standard, and thus supported, the barbs of all three together are cut up by the skilful pressure of a stout knife; they are then pointed, and turned by pressing them against a little ridge of sheet-brass let into a block of wood, and having the requisite curvature. The other end is next flattened out, by laying it on a small anvil, and striking a blow with a hammer. This is done to prevent the silk ligature from slipping over the end. The finer worm-hooks have the shanks filed, in order that the silk dressing may not enlarge the shank so much as to prevent the slipping of the worm over it. They are then hardened, tempered, and blued. The Limerick hooks are made by cutting the steel, which is made from the best malleable iron, into lengths for two hooks. The ends are then forged out to the shape of barb and point, and the barb is undercut *with a file* from the solid forged end, instead of being cut and turned up with a knife. This constitutes the chief superiority

of the Limerick hooks. They are shaped to the required curve by grasping them in circular pliers, and bending the wire with a turn of the wrist.

FISH-LOUSE, or **SEA-LOUSE**, names commonly given to the entomostracous crustaceans of the order *Siphonostoma*. All the creatures of this order are of small size, and parasitic on fishes, aquatic batrachians, &c., on the juices of which they live, although they have also the power of swimming freely in the water, some of their legs being adapted to this purpose, and, indeed, they can swim with extreme rapidity, making use of this power to gain that place where they may obtain food at the expense of other creatures. They do not begin life as parasites, the females depositing their numerous eggs on stones, plants, &c. They are animals of singular form and appearance. The genera *Argulus* and *Caligus* are now regarded as the



Fish-Louse:
1, *Caligus* (female); 2, *Argulus*, natural size; 3, *Argulus*, magnified.

types of two families. In the former, there is a curious sucking disc on each side of the beak or proboscis, although there are also jointed members terminated by prehensile hooks. In the latter, the hooks of the anterior pairs of feet are the principal organs of adhesion to the slippery bodies of the fishes from which food is to be drawn; and the abdomen of the female is furnished with two remarkably long tubes, the functions of which are not perfectly ascertained. The bodies of all of them are transparent, or nearly so. Some of the *Caligidæ* are common on many of the British sea-fishes; *Argulus foliaceus* on fresh-water fishes, and even on tadpoles. Sickly fishes often become the victims of multitudes of these creatures.

The name fish-louse is sometimes given also to the *Lernæidæ*, but they are very different.

FISHING-FROG. See ANGLER.

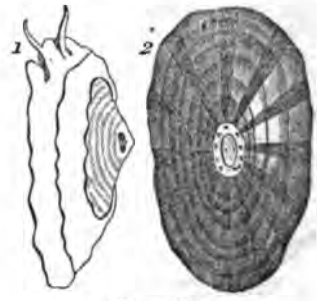
FISHING-TACKLE. See ANGLING.

FISHPONDS. See PISCICULTURE.

FISK, or **FISC**, a term often to be found in Scottish law-books. It is derived from the Latin *fiscus*, literally, a wicker-basket, which came ultimately to signify the privy purse of the emperor, as distinguished from the public treasury, which was called *ærarium*. In Scotland, it signifies generally the crown's revenues, to which the movable estate of a person denounced rebel was formerly forfeited. It still gives his name to a very important officer, the Procurator Fiscal (q. v.), or public prosecutor in the first instance, by whom all crimes are prosecuted before sheriffs and other inferior judges, and whose duty it is to report to crown counsel—i. e., to the Lord Advocate, or his deputes—all cases which, from their aggravated character, require to be tried by a higher court. See PUBLIC PROSECUTOR.

FISSIRO'STRES (Lat. split-beaked), a tribe of birds, one of the tribes into which the great order *Insessores* is divided. It is characterised by peculiar width of gape, and the bill is depressed or horizontally flattened, short, and often furnished with strong bristles at the angles; the birds of this tribe being insectivorous, and generally subsisting by catching insects on the wing, to which this structure of bill is beautifully adapted. The powers of flight are generally great, but the legs are short and weak. Swallows and goat-suckers are familiar examples of this order.

FISSURELLIDÆ, a family of gasteropodous molluscs, of the order *Scutibranchiata*. The shell much resembles that of the limpet family (*Patellidæ*), but has either a hole at the apex, or a slit at the front margin. The hole at the apex characterises the genus *Fissurella* (Keyhole Limpets), and



Fissurella:
1, the animal; 2, the shell.

the slit appears in the genus *Emarginula*. These openings of the shell are subservient both to the passage of the water requisite for respiration, and the discharge of the excrements. The fissurellidæ resemble limpets in their habits, and are found either on the sea-shore or at no very great depth. They are widely distributed over the world. Several species are British.

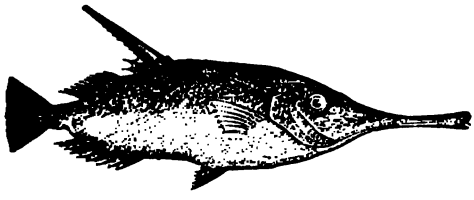
FISTULA, in former times, was applied, in its etymological meaning of a *pipe*, to such Abscesses (q. v.) as had contracted to narrow, hard, open passages in the soft texture of the body (see TISSUE), lined by a kind of false membrane, giving rise to a thin discharge. At the present time, however, the term fistula is generally limited to the opening of such a passage when in close contact with a mucous membrane. Thus it is common to speak of salivary, urinary fistula, &c.; and the most common and troublesome kind of all is the fistula in ano, in connection with the lower bowel, or Rectum (q. v.). The treatment of fistula should only be intrusted to experienced surgeons; but there are always quacks in abundance willing to undertake it, and hold out flattering hopes of an early cure without proper surgical procedure.

For the cure of salivary or urinary fistula, all that is generally necessary is to restore the patency of the ducts, which is done by passing instruments along them. Should a fistula, however, be situated where it is surrounded by muscular fibres, as at the

orifice of the lower bowel, it is necessary to divide these muscular fibres, so as to leave the part at rest while nature repairs it. As the sinus, which is the continuation inwards of the fistula, is lined with imperfectly organised lymph, it is generally necessary to stimulate the part by the introduction of lint, either alone or saturated with some irritant, such as the sulphate of zinc, which, when mixed in the proportion of 1—3 grains to each ounce of water, and coloured with lavender, makes the famous red lotion of the shops.

At times, however, fistulæ require more elaborate treatment, and are extremely difficult to close, especially those which result from loss of tissue between two adjacent mucous canals; fortunately, however, modern surgery is able to remedy these also. It is necessary to make the edges of the orifice once more raw, and to bring them in contact, but formerly the wound used rarely to unite, as the stitches produced such an amount of irritation. Now, however, by the use of silver or iron wire, according to the taste of the surgeon, the parts can be kept together long enough to insure union; and thus, by the ingenuity of American surgeons, especially Marion Sims of New York, and others in this country, certain diseases of women, arising from protracted labours, and formerly rendering the unfortunate subjects of them miserable and unfitted for any of the duties of life, may be now remedied by a skilfully performed, but almost painless proceeding.

FISTULA'RIDÆ, AULOSTO'MIDÆ, or FLUTEMOUTHS, a family of acanthopterous fishes, remarkable for the conformation of the head: the skull being elongated into a tube, at the extremity of which are the mouth and jaws. The species are all marine; they are widely distributed;



Snipe or Trumpet Fish (*Centriscus scolopax*).

only one, the Snipe-fish, Sea-snipe, or Trumpet-fish (*Centriscus scolopax*), is found, and that very rarely, in the British seas. These fishes are not to be confounded with the Pipe-fishes, which have a similar elongation of snout, but are otherwise very different.

FISTULI'NA, a genus of fungi allied to *Boletus* (q. v.); the under surface (*hymenium*) at first covered with minute warts, which ultimately form tubes. *F. hepatica* is common in Britain and throughout Europe on old oak, walnut, and chestnut trees; it occurs also on ash and beech. It is semicircular, of very regular outline, with a lateral stem, or none; its colour red; its substance fibrous and juicy, much resembling beet-root. When old and beginning to decay, it looks like a mass of liver. It sometimes attains a great size. Dr Badham describes a specimen nearly five feet round, and weighing eight pounds. Mr Berkeley mentions one which grew on an ash pollard, and weighed nearly thirty pounds. This fungus is much esteemed in some parts of Europe as an esculent; it is wholesome and nutritious; and the abundance in which it may often be procured, makes it the more worthy of regard; whilst there is almost no possibility of confounding it with any dangerous fungus. Its taste resembles that of the common mushroom, but

Fistulina Hepatica.

is rather more acid. 'When grilled, it is scarcely to be distinguished from broiled meat.' It furnishes itself with abundance of sauce.

FITCHET. See POLECAT.

FITCHY, or FITCHÉ. Crosses are said, in Heraldry, to be fitchy when the lower branch ends in a sharp point. Crosses are supposed to have been so sharpened to enable the primitive Christians to stick them into the ground for devotional purposes.

FITS, a name popularly applied to Convulsions (q. v.), or, indeed, to any sudden seizure of disease implying loss of consciousness, or any considerable change in the condition of the mind.

FITZ is an old Norman word signifying 'son,' evidently from the Lat. *filius* (Fr. *fils*). Like the Scotch *Mac*, the Irish *O'*, and the Oriental *Ben*, it is prefixed to proper names to signify descent, as in the Norman names Fitzwilliam, Fitzwalter, Fitzgerald. A later application of it has been to denote the natural sons of royalty, as in Fitzroy, Fitzjames, and Fitzclarence. The Russian termination *witch* is a disguised form of the same word.

FIU'ME (in the Illyrian language, *Reka* or *Rika*; Latin, *Fanum St Viti ad flumen*), an important seaport of Austria, is situated at the efflux of the Fiumara into the Gulf of Quarnero, in the Adriatic, 40 miles south-east of Trieste, across the Istrian peninsula, in lat. 45° 20′ N., and long. 14° 26′ E. F. has quite the character of a German town, is adorned with many handsome buildings, and consists of an old and new town, which together contain about 14,000 inhabitants. It has manufactures of tobacco, rosoglio, wax, paper, chemicals, and a flourishing trade in ship-building. F. has a fine freestone quay, with a light-house, but has little commerce. It has been a free port since 1722; and in 1849 was severed from Hungary with the territory to which it belongs, and now forms a portion of the Austrian crownland of Croatia.

FIVES, a popular game in England, and one especially enjoyed by school-boys, and in certain barracks where there is a 'court,' by soldiers. The game existed at a very early period—14th c.—both in France and England, being termed 'palm-play' in the former, and 'hand-tennis' in the latter; its present name is derived from its being played usually by five on each side. The method of playing the game is very simple: a good roomy court is requisite, bounded by a high wall at one end, and against this wall a ball is propelled by striking it with the open hand. The players arrange themselves either five against five, as is usually the case, or in fewer numbers, and begin the game by one member striking the ball against the wall, and causing it to rebound anywhere beyond the floor-score,

which is about two yards from the wall; one of the opposite party then strikes the ball as it rebounds, and if it does not touch the wall higher than three feet from the ground, his stroke goes for nothing, and the opposite party score one. The ball may be struck either from a direct rebound before it reaches the ground, or after it has 'dapped' or hopped from the ground once. Fifteen is usually game. When the players are skilful, the ball is kept going by the alternate strikers for many minutes at a time, and the game is thus rendered exciting both for players and onlookers.

FIXED AIR was the name given to Carbonic Acid (q. v.) by Dr Black, who was the first to observe that the solid substance, carbonate of magnesia (MgO,CO_2), could, when heated, evolve carbonic acid (CO_2), proving that the latter was a *fixed air* whilst in union with the magnesia.

FIXED BODIES is a term applied in chemistry to those substances which remain fixed, and are not volatilised at moderately high temperatures.

FIXED OILS are those oils which, on the application of heat, do not volatilise without decomposition. See OILS.

FIXED STARS. See STARS.

FIXING, in Photography. When a picture has been obtained through the agency of light, by the exposure of a sensitive surface suitably prepared, and the subsequent development of the latent image, there remains in the deepest shadows of the picture a portion of the sensitive material, unacted upon by light. The removal of this unaltered sensitive material by an appropriate solvent, is termed fixing, though the term *clearing* would perhaps be preferable, fixing being more strictly accurate in the case of the Daguerreotype process (q. v.), where the picture is literally *fixed* to the silver-plate by the deposition of a film of metallic gold, of extreme tenuity, from a boiling hot solution of Sel D'or (q. v.).

For particulars of failures arising from imperfect fixation or clearing, see PRINTING PROCESS.

FIXTURES, in the Law of England, are those personal chattels (q. v.) which are let into the soil, or otherwise actually affixed to the freehold; a definition which is sufficiently accurate to afford a principle for the solution of the questions which arise between landlord and tenant as to the right of the former to retain, or of the latter to remove—but a principle, the application of which is attended with many practical difficulties. If the chattels be entirely clear of the soil, they are not fixtures at all, and may be carried off at pleasure like any other species of personal property. The general rule as to what constitutes a fixture legally immovable is, that it must be either let into the earth, or cemented or otherwise united to some erection previously attached to the ground, so that it would be waste to remove it afterwards (Woodfall, pp. 466, 467). But it must be remarked, that a tenant may in all cases construct any erection he may make in such a manner as that it shall not become a fixture. Thus, if he even erect buildings—as barns, granaries, sheds, and mills—upon blocks, rollers, pattens, pillars, or plates, resting on brickwork, they may be removed, although they have sunk into the ground by their own weight (*Ib.* 467). To this rule various exceptions have been made in favour of what have been called *trade-fixtures*, or fixtures put up for the purpose of carrying on a trade; and the statute mentioned below has greatly modified the law as to those erected for agricultural purposes. It is difficult to state the limits of the exception with reference to trade-fixtures with any approach to accuracy. The following is perhaps as near an approach as the varying circumstances of each individual case will admit of. 'Whenever the following circumstances occur, it may be confidently pronounced that there the tenant may safely remove the article. Thus, things which the tenant has fixed to the freehold for the purposes of trade or manufacture, may be taken away by him whenever the removal is not contrary to any prevailing practice; where the articles can be removed without causing material injury to the estate, and where of themselves they were of a perfect chattel nature before they were put up, or at least have in substance that character independently of their union with the soil—or, in other words, where they may be removed without being entirely demolished, or losing their essential character or value' (*Ib.* p. 468); see also the case of Hellawell *v.* Eastwood, 6 Excheq. Rep. 312. Nurserymen have been allowed to remove trees and shrubs which they have planted expressly for purposes of sale, but not to plough up strawberry-beds, out of the ordinary course of management of the nursery-ground. Neither can they remove hot-houses, green-houses, forcing-pits, or other erections of that description; and in no case can private persons sell or remove fruit-trees, though planted by themselves (Amos and Ferard on *Fixtures*, 343, 2d edition). The provision of the common law of England with reference to agricultural fixtures has been modified by 14 and 15 Vict. c. 25, s. 3, which provides, that if any tenant of a farm or land shall, with the consent in writing of the landlord for the time being, at his own cost, erect any farm-buildings, either detached or otherwise, or put up any other building, engine, or machinery, either for agricultural purposes or for the purposes of trade and agriculture (which shall not have been put up in pursuance of some obligation in that behalf), then all such building, engines, and machinery shall be the property of the tenant, and shall be removable by him, notwithstanding the same may consist of separate buildings, or that the same, or any part thereof, may be built in or permanently fixed to the soil, so as the tenant making such removal do not in anywise injure the land or buildings belonging to the landlord, or otherwise do put the same in like plight and condition as the same were in before the erection of anything so removed, provided that no tenant shall be entitled to remove any such matter or thing without giving to the landlord or his agent one month's previous notice in writing of his intention so to do; and thereupon it shall be lawful for the landlord, or his agent, on his authority, to elect to purchase the matters and things proposed to be removed; and the right to remove the same shall thereby cease, and the same shall belong to the landlord; and the value thereof shall be ascertained by two referees, one to be chosen by each party, or by an umpire to be named by such referees, and shall be paid or allowed in account by the landlord who shall have so elected to purchase.' This act is confined to England; but in questions of fixtures, as Mr Hunter observes, the common law of England having been deemed practically authoritative in Scotland, the clause affords valuable matter for consideration, as shewing what has been held advisable in England (*Landlord and Tenant.* p. 290, 3d edition). In Scotland, it has been customary, in agricultural leases more particularly, to determine the respective rights of landlord and tenant by positive stipulation, and, for this reason, fewer points have been decided by the courts than in England.

As regards urban tenements, the rule seems to be that the tenant may remove whatever he has fixed up for ornament or domestic use—e. g., hangings

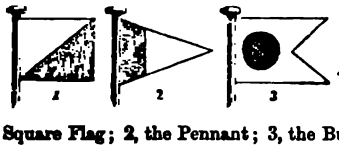
s, stoves, &c., but not such erections as have part of the tenement, and constitute per- improvements. Thus, he cannot remove a atory fixed to and communicating with n a dwelling-house by windows and doors.

'CCUS, C. VALERIUS, a Roman poet, who ed in the 1st c., and is supposed to have died Absolutely nothing is known regarding He is the author of an epic poem on the utic expedition, which in its extant form is ete. Some modern critics, Wagner among praise it extravagantly, and place the author Virgil; but the more general opinion of cholars is, that the work is rather a specimen ied mediocrity than of genuine inspiration. *itio princeps* of the *Argonautica* appeared in Of modern editions, may be mentioned those ner (Gött. 1805) and Lemaire (Paris, 1824). glish metrical translation was published by cholas Whyte as early as 1565. Similar ions exist in French, Italian, and German.

COURTIA'CEÆ, a natural order of exo- plants, allied to Passion-flowers, consisting bs and small trees, almost exclusively con- the warmest parts of the globe. Many of cies, particularly of the genus *Flacourtia*, pleasant, sweet, or subacid fruits. *Fla- inermis* is much esteemed and cultivated Moluccas. Arnotto (q. v.) is produced by a this order.

G, a popular name for many endogenous rith sword-shaped leaves, mostly growing in tuations. It is sometimes particularly appro- to the species of *Iris* (q. v.), or Flower- ; but is given also very indiscriminately r plants of similar foliage, as the *Acorus* (see ACORUS), which is called Sweet Flag.

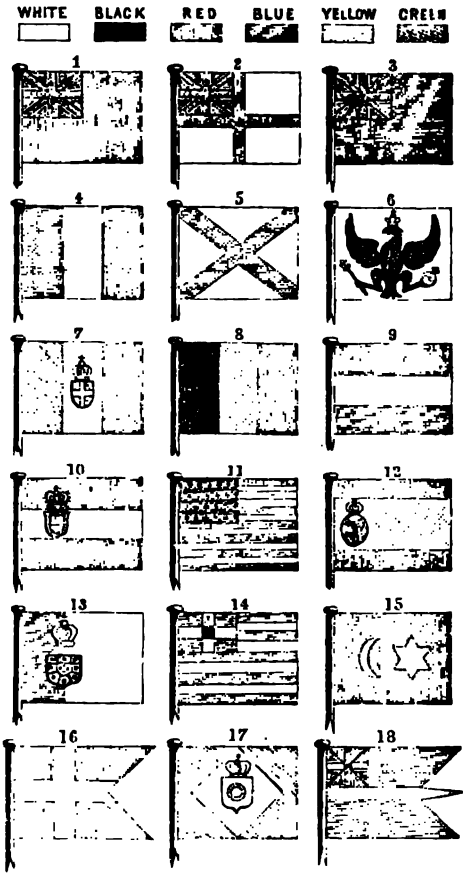
G (common to the Teutonic languages, and from a root signifying to fly), a cloth of aterial, capable of being extended by the nd designed to make known some fact or spectators. In the army, a flag is the arried as its distinguishing mark by each t; and also a small banner, with which the to be occupied is marked out. In the navy, is of more importance, often constituting y means vessels have of communicating ch other, or with the shore. For this devices of conspicuous colours (usually hite, red, yellow, or blue) are hoisted at t-head or at the gaff. The flags having rms—viz.



Square Flag; 2, the Pennant; 3, the Burgee.

few patterns in each shape give sufficient tions of three or four flags to express any word in the language. The flag is also a he rank of the principal person on board a as the 'Royal Standard,' containing the the United Kingdom, which is only hoisted member of the royal family is on board; hor of Hope, on a red ground, denoting miralty; the pennant, which specifies the s squadron to which the ship belongs (see VICE); and the ensign, which denotes n.

ssigns borne by ships-of-war of the leading states of the world are as shewn below (in these diagrams, the direction of the lines shews the colour as in heraldry), viz.:



Flags of the Principal Maritime Nations:

1, Britain, red ensign; 2, Britain, white ensign; 3, Britain, blue ensign; 4, France; 5, Russia; 6, Prussia; 7, Italy; 8, Belgium; 9, Holland; 10, Austria; 11, United States; 12, Spain; 13, Portugal; 14, Greece; 15, Turkey; 16, Denmark; 17, Brazil; 18, Sweden.

A white flag is accepted throughout the world as a token of peace; a red flag, as defiance; and a black flag denotes a pirate; a flag of plain yellow usually signifies that the vessel bearing it is in quarantine. See also UNION JACK.

FLAG OF THE PROPHET (Sanjak-Sherif) is the sacred banner of the Mohammedans. It was originally of a white colour, and was composed of the turban of the Koreish, captured by Mohammed. A black flag was, however, soon substituted in its place, consisting of the curtain that hung before the door of Ayeshah, one of the Prophet's wives. This flag, regarded by the Mohammedans as their most sacred relic, first came into the possession of the followers of Omar at Damascus; it afterwards fell into the hands of the Abbasi; then passed into those of the califs of Bagdad and Kahira; and, at a later period, was brought into Europe by Amurath III. It was covered with forty-two wrappings of silk, deposited in a costly casket, and preserved in a chapel in the interior of the seraglio, where it is guarded by several emirs, with constant prayers.

The banner unfolded at the commencement of a war, and likewise carefully preserved, is not the same, although it is believed by the people to be so.

FLAG-CAPTAIN, in the Navy, is the captain of the admiral's ship in any squadron, and is ordinarily his nominee.

FLAG-LIEUTE'NANT is an officer who, in the navy, performs such duties for an admiral as would devolve upon an aide-de-camp in the army. He communicates the admiral's orders to the various ships, either personally or by signal.

FLAG-OFFICER, in the British Navy, is an admiral, vice-admiral, or rear-admiral. He is so called from his right to carry, at the mast-head of the ship in which he sails, a flag denoting his rank. For an admiral, the flag is borne at the main; for a vice-admiral, at the fore; and for a rear-admiral, at the mizzen: the flag being, in either case, red, white, or blue, according to the squadron to which the officer belongs.

FLAG-SHIP, the ship in a fleet which bears the admiral's flag, and therefore forms a sort of centre to which all other vessels must look for orders. It is usually the largest vessel in the fleet.

FLA'GELLANTS, the name given to certain bodies of fanatical enthusiasts, who, at various intervals from the 13th to the 16th c., made their appearance in the different countries of Europe, proclaiming the wrath of God against the corruption of the times, inviting sinners to atone for sin by self-inflicted scourgings or flagellations, and themselves publicly enforcing this exhortation by voluntary scourging of themselves, and by other forms of self-castigation. In large and disorderly bands—frequently headed by priests, and by fanatics in the costume of priests and monks, bearing banners and crucifixes aloft, their breast and shoulders bare, and their face concealed by a hood or mask, each armed with a heavy knotted scourge, loaded with lead or iron—they marched from town to town, chanting hymns full of denunciations of vengeance and of woe. In the most public place of each town which they entered, they threw themselves upon the earth, with their arms extended in the form of a cross, and there inflicted upon themselves the discipline of scourging, frequently to blood, and even to mutilation. Each member enrolled himself for 33 days, in honour of the 33 years of the life of our Lord on earth; and all for the time professed entire poverty, subsisting only on alms or voluntary offerings. These fanatical movements, resembling, in some respects, at least, the religious revivals of our own time, recurred at frequent intervals. The most remarkable, however, are three in number. The first originated at Perugia in 1260, at a time when society in Italy was greatly disorganised by the long continued struggles of the Guelph and Ghibelline factions. The very disorders of the time prepared the way for this religious reaction. Numbers crowded to follow the new cry, until at last the body became so formidable as to draw upon itself the suspicions of Manfred, the son of Frederic II., by whom it was vigorously suppressed. Later offshoots of the party made their appearance in Bavaria, Austria, Moravia, Bohemia, Poland, and France; when to their extravagant practices, they added still greater extravagances of doctrine. In virtue of a pretended revelation, they asserted that the blood shed in self-flagellation had a share with the blood of our Lord in atoning for sin; they mutually confessed and absolved each other, and declared their voluntary penances to be a substitute for all the sacraments of the church, and for all the ministrations of the clergy. The Jews were to them an object of special abhorrence; and this unfortunate race, exposed at all times to every caprice of the popular will, suffered dreadfully from the fury of the Flagellants in many of the towns of Germany and the Netherlands. In the second outbreak of Flagellantism about 1349, the outrages against public decency were much more flagrant than at its first appearance. Men and women indiscriminately now appeared in public half naked, and ostentatiously underwent these self-inflicted scourgings. The immediate occasion of this new outburst of fanaticism, was the terror which pervaded society during the dreadful plague known as the Black Death, which Hecker, in his *Epidemics of the Middle Ages*, describes with terrible fidelity. The same extravagances were again repeated in Upper Germany, the provinces of the Rhine, the Netherlands, Switzerland, Sweden, and even England. Although rigorously excluded from France, these fanatics effected an entrance into Avignon, then the residence of the popes, when they were condemned by a bull of Clement VI. The mania gradually subsided, nor do we again find any permanent trace of it till the beginning of the next century. In the year 1414, a new troop of Flagellants, locally called *Flegler*, made their appearance in Thuringia and Lower Saxony, renewing and even exaggerating the wildest extravagances of their predecessors. These new fanatics appear to have rejected all the received religious usages, and indeed all external worship, placing their entire reliance on faith and 'flagellation.' Their leader was called Conrad Schmidt. They rejected not only the doctrines of the church upon the sacraments, but also purgatory and prayers for the dead. Schmidt pretended a divine mission; and proclaimed that the blood of flagellation was the true wedding-garment of the gospel; that it was more precious than the blood of the martyrs, and a sure passport to eternal life. The violence of these fanatics drew upon them the severest punishments of the Inquisition. Many of them were capitally condemned, and Schmidt himself was burned at Sangerhausen in 1414. Their doctrines, comprised in fifty articles, were condemned in the Council of Constance.

These strange extravagances are reprobated by the Roman Catholic Church in common with all other Christian communities; but Roman Catholics (relying on 1 Cor. ix. 27, Coloss. iii. 5) hold the lawfulness, and even the meritorious character, of voluntary self-chastisement, if undertaken with due dispositions, practised without ostentation or fanaticism, and animated by a lively faith and a firm hope in the merits of Christ. This is the self-castigation known under the name of 'the Discipline'—a form of mortification not unfrequent in the monastic state, and even practised by lay persons, and these sometimes of the highest rank, both in ancient and in modern times. Compare Forstemann's *Die Christlichen Geisslergesellschaften*, Wadding's *Annales Minorum Fratrum*, Raynaldi's *Continuation of Baronius*, Mosheim's *Church History* (Soames' ed.), Giesceler's *Kirchengeschichte*, Milman's *Latin Christianity*, and Wetsir's *Kirchen-Lexicon*.

FLA'GEOLET, a wind instrument with a mouthpiece like the common whistle. It is made of boxwood or ivory, in several pieces, and has holes for the fingers, like the flute. According to Burney, the flageolet was invented by Sieur Juvigny in 1580.

FLAGEOLET-TONES is the name given to the harmonic notes of the violin, violoncello, and other stringed instruments, which notes are produced by the finger lightly touching the string on the exact part which generates the harmony, and not by pressing the string down to the finger-board. The string

ss on both sides of the finger, the long side ig itself into parts of the same length as the ide. See HARMONICS. The inventor of the r of playing flageolet-tones is said to have Domenico Ferrari. The best work on the t is by Collinet.

A'GSTONE, a rock which splits into tabular , or flags of various size and thickness, in the ıl plains of stratification. Flagstones are lly sandstones, combined with more or less ceous or calcareous matter; some, however, durated clays, and others thin-bedded lime-

They are used for paving, cisterns, &c. ıost famous are those of Festiniog (North), remarkable for their large size, even grain, eat beauty; those of Yorkshire, also of large ınd of great hardness and toughness; and of Caithness, which are extremely tough and e. The Caithness flags belong to the Old andstone; the Yorkshire are taken from the ne grit division of the Coal Measures.

A'MBOROUGH HEAD (Saxon, *Fleam-*, a promontory of the Yorkshire coast, and g the northern boundary of Bridlington It terminates a range of white perpen- chalk cliffs, 6 miles long, and 300 to 450 gh. Its rugged sides contain many caverns, the sea near are picturesque chalk rocks, swarm with sea-birds. The chalk contains ponges, crinoids, &c. On the Head is a light- 214 feet high, seen 19 miles off, and in lat. N., and long. 0° 5' E. Across the peninsula, in the Head, runs a ditch, with two lines of e and breast works, called Dane's Dyke, but an ancient British work.

AMBOY'ANT, the latest style of Gothic ecture which prevailed in France. It prevailed during the 15th and part of the 16th cen- and corresponds to the Perpendicular (q. v.) gland. The name is derived from the flame- rms of the tracery of the windows, panels, g. 1). The characteristics of this style are

Fig. 1.—Window, Harfleur.

e and elaborate ornament, combined with l bareness of surface. The crockets, for ce, are generally cut into a great number of leaves, while they are placed far apart; the ings are divided into large empty hollows, and small thin fillets and beads; the finials have crockets minutely carved, set upon bare pyramidal terminals; the arch-mouldings are divided into a great number of small parts, and want the boldness and decision of the earlier styles. These mouldings are frequently abutted on the pillars, or continued down them without any caps; and when there are caps, they are small and without effect. See fig. 2. When mouldings join, they are frequently run through one another, so as to appear to interlace. The effect is intricate rather than beautiful, suggestive, like the rest of the style, of ingenuity in stone-cutting rather than art. The doorways and windows are sometimes large and fine (as in fig. 1); but whil these are highly enriched, the general surface of the building is left too plain. There are many large buildings in France executed in this style, but it is usually portions only which are fine, not the general effect. Some of the spires of this period are also very beautiful. The north spire of Chartres Cathedral, for example, is considered one of the finest in France.

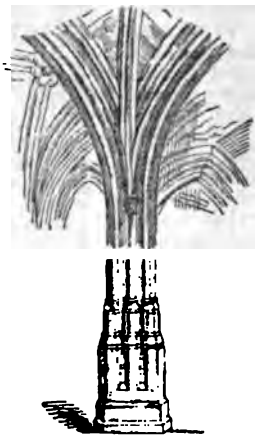


Fig. 2.

FLAME is a particular form of Combustion (q. v.) or burning. Ordinary combustion consists in the oxygen of the atmosphere combining with some combustible substance so rapidly as to give out light and heat. When the combustible is either originally a gas, or becomes so by the heat, the combustion takes the form of flame. Flame, then, is the burning of a gas. In most cases, the gas of flame is a compound of hydrogen and carbon, with minute particles of solid carbon suspended in it, and is formed from the fuel (coal, tallow, &c.) being decomposed by the heat. The heat and light of flame vary with the gas: hydrogen produces great heat, but little light. The lighting power of a gas depends upon the proportion of carbon it contains, the particles of which become glowing hot before being consumed.

The flame of a lamp or candle, or simple gas-jet, consists of a hollow cone, in the centre of which there is no combustion. The central space appears dark only by contrast with the luminous cone which surrounds it. It consists, in reality, of transparent invisible compounds of carbon and hydrogen, which are constantly rising in vapour from the wick. If a glass tube, open at both ends, be held obliquely in the flame of a candle, with its lower extremity in the dark central space above the wick, it will conduct away a portion of the combustible vapour, which may be kindled like a gas-jet at its upper end, as represented in fig. 1. This dark portion of the flame may be called *the area of no combustion*.

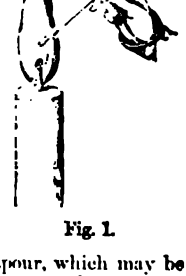

Fig. 1.

The luminous cone which envelops the dark space is *the area of partial combustion*. The oxygen

of the atmosphere penetrates to this depth, but not in sufficient quantity to oxidise or burn both the carbon and the hydrogen; it therefore unites with the hydrogen, for which it has the stronger attraction, and leaves the carbon free. The outer cone is named *the area of complete combustion*, because there the carbon meets with sufficient oxygen to burn it entirely. The light is produced in the area of partial combustion, where the carbon is set free from the hydrogen in the form of solid particles, and is heated to whiteness by the combustion of the hydrogen. The combustion of the carbon in the outer cone, by which it is converted into carbonic acid gas, produces heat, but so little light as to be barely traceable.

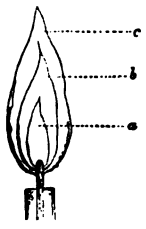

Fig. 2.
a, area of no combustion; *b*, area of partial combustion; *c*, area of complete combustion.

That carbon exists in a solid state in the white part of a flame, is readily shewn by holding a piece of white earthen-ware into it, which becomes coated with carbon in the form of soot. No soot is deposited in the dark or no-combustion area of the flame, because there the carbon is in chemical combination with hydrogen, forming a gas. The carbon becomes solid only when the hydrogen deserts it, as it were, to unite with oxygen.

The highly illuminating power of compounds of hydrogen and carbon is thus traced to the fact, that *their hydrogen and carbon do not burn simultaneously, but successively, and in such a way that the one heats the other white hot.* It is quite possible to make them burn simultaneously; but when they do, the light evolved is very feeble. This takes place in the 'Bunsen burner,' in which air is allowed to mix with the gas before combustion.

FLA'MENS were priests in ancient Rome devoted each to some special deity. There were fifteen in all. The chief of these (*Flamines Majores*) were the flamens of Jupiter, of Mars, and of Quirinus, who were always patricians; the remaining twelve (*Flamines Minores*) were chosen from the plebeians. The flamens were elected at first by the *Comitia Curiata*, but afterwards by the *Comitia Tributa*, and were installed into their office by the supreme dignitary of the Roman pagan religion, the *Pontifex Maximus*. The flamen of Jupiter was a privileged person; he was not required to take an oath, was attended by a lictor, his house was an asylum, and he had a seat in the senate. But all this was attended by numerous superstitious restrictions: he might not have a knot on any part of his attire, nor touch flour, or leaven, or leavened bread; he might not touch or name a dog, or mount a horse, or be a night out of the city, &c. His wife, called Flaminica, was subjected to similar restrictions, and when she died, the flamen was obliged to resign. The majority of Roman writers attribute the institution of flamens to Numa.

FLAMI'NGO (*Phœnicopterus*), a genus of birds which until recently was placed by all naturalists among the *Grallatores* (Waders), but is now generally ranked among the *Palmipedes*, and even referred to the family of *Anatidæ*. The bill is large, deeper than broad, and suddenly curved downwards near the middle, so that, as the bird wades and seeks its food, either in the water or in the mud, it makes use of the bill in a reversed position, the upper mandible being lowest. The edges of both mandibles are furnished with small and very fine transverse laminæ, which serve, like those in the bills of the ordinary *Anatidæ*, to prevent the escape of the small crustaceans, molluscs, worms, small fishes, seeds, &c., which are the F.'s food, and to separate them from the mud with which they may be mingled. The upper surface of the tongue is also furnished on both sides and at the base with numerous small flexible horny spines, directed backwards. Unlike the ordinary *Anatidæ*, flamingoes have great part of the tibia, as well as the tarsus, naked, in this resembling all the Waders. They are birds of powerful wing, and fly either in strings or in wedge-shaped flocks like geese, a single bird leading the way for the flock. They seldom make use of their webbed feet for swimming, to which the length of their legs is not well adapted, the use of the membrane being rather to support them on soft muddy bottoms. When feeding, they keep their feet in almost constant motion, as if to stir the mud. Hundreds may sometimes be seen feeding together in the shallow waters or salt marshes of tropical coasts, chiefly of Asia and Africa, or on the banks of rivers or inland lakes, and by their large size and rich colours making a brilliant spectacle. They make their nests in marshes, scraping together a heap of mud, on the top of which is the nest; and it is said that the long legs of the female F. often hang down into the water during the incubation, not being easily disposed of otherwise.—There are several species of F., but very similar to each other, both in appearance and habits. One species only visits the south of Europe, the Common F. (*P. ruber*), a bird measuring fully four feet from the tip of the bill to that of the tail, and six feet from the tip of the bill to the claws; the male, when in full plumage, is of a rose-red colour, with deep purple wings; the female, and the young for several years, are less brilliant, the young at first being whitish, and the red first appearing on the wings.—The AMERICAN F. (*P. Americanus* or *Chilensis*) is of a more orange tint, and is abundant on many parts both of the eastern and western coasts of America.

Flamingo (*Phœnicopterus ruber*).

FLAMI'NIAN WAY (*Via Flaminia*), the great northern road of ancient Italy, leading from Rome to Ariminum (*Rimini*) on the Adriatic. It was constructed by C. Flaminius during his censorship (220 B. C.), and was designed to secure a free communication with the recently conquered Gaulish territory. The F. W. was one of the most celebrated and most frequented roads of Italy both during the period of the Republic and of the Empire. Its importance may be estimated from the fact, that when Augustus (27 B. C.) appointed persons of consular dignity road-surveyors for the other highways of his dominions, he reserved the care of the F. W. for himself, and renewed it throughout its whole length. Its general direction was northerly. Leaving Rome, it kept for the most part at no great distance from the Tiber till it reached Narnia (*Narni*), where it struck off in a north-easterly direction, passing Interamna (*Terni*) and Spoletium (*Spoleto*), and reaching the foot of the Apennines, at Forum Flaminii. Crossing the central ridge of the Apennines, at Ad Ensem (La

Schieggia ?), it again proceeded in a northerly direction, pursuing much the same line of route as the modern road from Foligno to Fano, and reached the Adriatic at Fanum Fortunæ (Fano), whence it wound along the coast to Ariminum (Rimini), where it ended, or rather where the name ceased; for the Via Æmilia (see EMILIAN PROVINCES) was just a continuation of it. The whole length of the road from Rome to Ariminum was (according to the Jerusalem Itinerary), 222 miles, and according to the Antonine, 210 miles. Remains of it still exist at various places, and assist the antiquary in tracing its direction.

FLAMSTEED, JOHN, the first astronomer-royal of England, for whose use the Royal Observatory at Greenwich (called Flamsteed House) was built, was born near Derby, 19th August 1646, and early devoted himself to mathematical and astronomical pursuits. While yet a youth, he mastered the theory of the calculation of eclipses; and his calculations of some remarkable eclipses of the moon were the means of introducing him to the notice of the eminent scientific men of his time, among others to Sir Jonas Moore, then Surveyor-general of the Ordnance, through whom, and in connection with whose department, he was appointed astronomer to the king in 1675. The year following, the Observatory at Greenwich was built, and F. began that series of observations that constitute the commencement of modern practical astronomy. He formed the first trustworthy catalogue of the fixed stars, and furnished those lunar observations on which Newton depended for the verification of his lunar theory. Extracts from the papers of F., found in the Observatory by Mr Francis Baily, and published by authority of the Admiralty in 1835, brought to light a very sharp quarrel that had taken place between F. and Newton and Halley with regard to the publication of the results of F.'s labours. The *Historia Cœlestis Britannica*, his great work, in three vols., giving an account of the methods and results of astronomical observation up to his time, was begun to be printed before his death in 1719, but was not published till 1725. It may be mentioned that F., while following his scientific pursuits, qualified himself for holy orders, and in 1684 was presented to the living of Burslow, in Surrey, which he held till his death.

FLANCHES, or FLANQUES, in Heraldry, are composed of arched lines drawn from the upper angles of the escutcheon to the base points. The arches of the flanches almost meet in the centre of the shield. The Flanches are an ordinary little used in Scotch heraldry.

FLANCONNADE, a thrust in Fencing (q. v.).

FLANDERS was formerly the name of an extensive and almost independent territory ruled by 'counts,' and embracing, besides the present Belgian provinces of the same name, the southern portion of the province of Zealand in Holland, and some of the departments in the north-east of France. Cæsar found this district inhabited by the Morini, the Menapii, and the Nervii, and having conquered these tribes, he annexed the country. Under the rule of the Franks, the river Scheldt, which flowed through the district, formed the boundary line between Neustria and Austrastia, in consequence of which the northern and south-western part of the territory comprised under the term F., although its population was decidedly Germanic, came to belong to France, while the south-east, although to a large extent non-Germanic, was after 1007 included in the German Empire. F. obtained its name from the *Vlândergau* (*pagus Flandrensis*, the district around Bruges and Sluis), whose counts had been made wardens of the north-eastern coasts of France at the period of the incursions of the Normans, in the latter half of the 9th c., and who extended the name of their hereditary possessions to the whole district which they governed. The first count or markgraf of the country is said to have been Baldwin, surnamed *Bras de Fer* (Iron-Arm), who married Judith, the daughter of King Charles the Bald of France, and widow of Ethelwulf, king of England, and afterwards received the newly created 'mark' or county, in 864, as a hereditary fief from his father-in-law. He extended his territories by the addition of Artois, which was held by his successors until Philippe Auguste reunited it to France. He died in 879, but not until he had inaugurated the industrial greatness of F. by introducing into it a great number of workmen skilled in the manufacture of woollen and other goods. Baldwin IV., or the Bearded, one of the successors of Baldwin *Bras de Fer*, received in fief from the Emperor Henry II. the burgraviate of Ghent, Walcheren, and the islands of Zealand, and thus became a prince of the German empire. He was succeeded by his son Baldwin V., or the Pious (1036–1067), who increased his possessions by the addition of the German territory between the Scheldt and the Dender, belonging to the duchy of Lower Lorraine. To this he added Tournay, the supremacy over the bishopric of Cambray (to which, till the erection of the new bishopric of Arras, the county of Flanders had been ecclesiastically subordinate), and the county of Hainault. During the Middle Ages, F. figured prominently in the political affairs of Europe—the counts of F. being more powerful and wealthy than many European kings. Baldwin IX., the founder of the Latin kingdom at Constantinople, died in 1206, leaving two daughters, one of whom died without children; the other bequeathed Hainault to John of Avennes, her son by her first marriage; and F. to Guy Dampierre, her son by a second marriage. Meanwhile, the industrial prosperity of the cities of F. had become so great, that the citizens began to feel their own power, and to claim independence. They formed republican communities like the free cities of Germany, with this difference, that they admitted the nominal suzerainty of the counts. But they were not afraid to take up arms in defence of their liberties against their nominal masters. Witness the insurrection headed by Jakob van Artevelde (q. v.) against the cruel government of Count Louis I. On the marriage of Marguerite, the daughter and heiress of Louis II., Count of Flanders, to Philip the Bold of Burgundy, the country was united to the Burgundian territories in 1384, and afterwards shared the fortunes of that duchy. The dukes of Burgundy brought great part of the former duchy of Lower Lorraine under their dominion, and thus laid the foundation for the subsequent union of the states of the Netherlands, in which F. continued to form one main component part. On the death of Charles the Bold, these territories passed, in 1477, to the House of Hapsburg, by the marriage of his daughter Mary to the Archduke Maximilian. After Burgundy had passed with King Philip II. to the Spanish line of the House of Hapsburg, the territory of F. was considerably diminished, as not only was the portion called Dutch Flanders transferred to the Estates-general by the peace of Westphalia, but, in the time of Louis XIV., France seized upon another portion of F., as also a part of Hainault, Cambray, and Artois, and was confirmed in her possession by the peace of Aix-la-Chapelle, of Nimeguen, and of Utrecht. By the last, and by the treaty of peace concluded at Rastadt, the remains of the Spanish Netherlands again fell into the hands of the House

of Austria. In 1794, F., like the other provinces of Belgium, was incorporated with the French Republic, and afterwards with the Empire, and formed the departments of Lys and Escaut; the Congress of Vienna, however, conferred these portions on the new kingdom of the Netherlands, with which they remained united till the formation of the kingdom of Belgium (q. v.). The Belgian portion of F. is now divided into the provinces of East and West Flanders (q. v.).—Compare Praet, *Histoire des Comtes de Flandres, et de l'Origine des Communes Flamandes* (Brussels, 1828); Le Glay, *Histoire des Comtes de Flandres jusqu'à l'Avènement des Ducs de Bourgogne* (2 vols., Paris, 1843); Kervyn van Lettenhoven, *Histoire de Flandres* (6 vols., Brussels, 1847—1851), &c.

FLANDERS, EAST, a province in the north-west of Belgium, is bounded on the E. by the provinces of Antwerp and Brabant, on the S. by that of Hainault, on the W. by that of West Flanders, and on the N. by the Dutch province of Zealand. It has an area of 1146 square miles, and a population which amounted in 1859 to 791,843, or 690 to the square mile. East F. is the most populous province of the most populous country in Europe. See BELGIUM. It is watered mainly by the Scheldt, and by its affluents the Lys and the Dender. The surface is low and level. The soil has been rendered extremely fertile by means of spade cultivation and an excellent manuring system. Besides the ordinary varieties of grain, potatoes, flax, hemp, and hops are produced in great quantity. The district in the north-east of the province, between the towns of Antwerp and Ghent, is celebrated as a flax-growing quarter. The manufactures are chiefly lace, damasks, linens, woollens, bobbin-net, silk, and cordage; sugar-refining, brewing, and distilling are also carried on. Chief towns, Ghent, Alost, and Dendermonde.

FLANDERS, WEST, the most western province of Belgium, is bounded on the N. by the North Sea, and on the W. and S. by France. Its area is 1237 square miles, and its population in 1859 amounted to 634,918. Its chief rivers are the Lys and the Iser; but it is watered by numerous smaller streams, and is intersected by many important canals. Its surface is flat, with sandy hills in the south and along the coast; and its soil sandy, but well cultivated and productive. It has fewer products and manufactures than East Flanders. Chief towns, Bruges, Courtrai, and Ostend.

FLANGE, a rim or projection upon a tube or cylinder of metal or other material, to serve as a bearing, or afford means of fixing it; for example, the projecting rim on the tires of the wheels of railway-carriages is called a flange.

FLANK (the side), a word used in many senses in military matters. *Flanks of an army* are the wings, or bodies of men on the right and left extremities, prepared to close in upon an enemy who shall attack the centre. *Flank files* are the soldiers marching on the extreme right and left of a company or any other body of troops. *Flank company* is the company on the right or left when a battalion is in line; the grenadier and light infantry companies usually occupy these positions, and are known as flank companies, whether with the remainder of the regiment or not. A *flanking party* is a body of horse or foot employed in hanging upon and harassing the flank of an enemy's force.—Flank, as applied in Fortification, will be best described under that article (q. v.). The *flanks of a frontier* are certain salient points in a national boundary, strong by nature and art, and ordinarily projecting somewhat beyond the general line. The effect of these flanks is to protect the whole frontier against an enemy, as he dare not penetrate between them, with the risk of their garrisons, reinforced from their own territories, attacking his rear, and cutting off communication between him and his base. Silistria and Widin were flanks of the Turkish frontier during Omar Pasha's campaign in 1853 and 1854. Similarly, in the event of an invasion of England from the coast of Sussex or Kent, Portsmouth and Chatham would be formidable flanking garrisons, which would almost necessarily have to be subdued before the invader could march on London.

In evolutions, 'to flank' is to take such a position with troops as either to aid one's own army in an attack on the enemy, by leading the latter to suppose that his flanks are in danger in his present position, or to prevent him from advancing on one's comrades by threatening his flanks if he should do so. To *outflank* is to succeed by manœuvres in commanding the flank of an enemy who has been, on his part, endeavouring to flank one's own force.

FLANNEL (Welsh, *gwlanen*, from *gwlan*, wool, allied to Lat. *lana*), a woollen fabric, differing from broadcloth and most other woollen fabrics in being woven of yarn more loosely twisted, and having less dressing. The best flannel is made in the neighbourhood of Welshpool and Newtown, in Wales, from the wool of the Welsh mountain-sheep, and is commercially known as Welsh flannel. Large quantities are also made in West Lancashire, West Yorkshire, and the neighbourhood of Leeds. A more closely spun and woven flannel, used for cricketing and rowing shirts, &c., and dyed and printed with various colours and patterns, is made in the west of England cloth-making district, in the vicinity of Stroud, in Gloucestershire. Fine light flannel of this kind is made in France and Belgium; some of this is twilled, and approaches nearly in quality to French merinoes, but is much softer. The demand for this sort of fancy-shirting flannel has of late become considerable, and has led to the production of many varieties, which, though bearing the name of flannel, vary so materially from the original Welsh flannel, that they can scarcely be included with them under any general definition. Coarse flannel, called *Galways*, is made in Ireland, and is chiefly used by the peasantry of the country.

FLAT, a musical character, shaped thus ♭, which, when placed before a note, lowers that note half a tone. When placed at the beginning of a piece of music, it denotes that all the notes on the line or space on which it is placed, with their octaves above and below, are to be played flat.

FLAT-FISH, a popular name of the fishes of the family *Pleuronectidæ* (q. v.), as the flounder, plaice, sole, turbot, halibut, &c.; which have the body much compressed, and the sides unsymmetrical, swimming on one side. It is sometimes extended in its signification so as to include skates and other fishes of the Ray (q. v.) family, which are very different, being cartilaginous fishes, quite symmetrical, and swimming on the belly, although, like the *Pleuronectidæ*, generally keeping close to the bottom. It is never applied to the much compressed symmetrical fishes, such as the dory, which swim in the ordinary posture of fishes, the dorsal edge upwards, the ventral downwards.

FLATTERY, CAPE, a headland of Washington territory, on the Pacific coast of the United States, marks the south side of the entrance of the Strait of Juan de Fuca. It is in lat. 48° 24′ N., and in long. 124° 40′ W.—Another headland of the same name is found on the east coast of Australia, in lat. 14° 52′ S., and long. 145° 20′ E. It is about 30 miles to the north of Endeavour Bay.

FLATULENCE, distention of the stomach or bowels by the gases formed during digestion. See INDIGESTION.

FLAVINE, or **FLAVIN**, is a yellow colouring matter employed in dyeing, and imported in the condition of extract. It is understood to be the colouring matter of bark (quercitron bark), and is used in place of quercitron bark. When treated with hot water, flavine yields a yellow turbid solution, which, on settling, deposits a yellow-brown powder. When employed in dyeing, the cloth is first treated with an aluminous mordant (see CALICO-PRINTING); and on subsequent immersion in the solution of flavine, a fine yellow colour is fixed on the cloth. The colouring power of the extract flavine as imported is so great that one ounce is equal in dyeing qualities to one pound of quercitron bark.

FLAX (*Linum*), a genus of plants comprising the greater part of the natural order *Linaceæ*; an exogenous order allied to *Geraniaceæ* and *Oxalideæ*, and consisting of annual and perennial herbaceous plants, with a few small shrubs. There are about ninety known species of this order scattered over the globe, but most abundant in Europe and the north of Africa. Their leaves are simple, entire, without stipules, and generally alternate. The COMMON FLAX or LINT (*L. usitatissimum*) is an

Common Flax (*Linum usitatissimum*).

annual; a native of Egypt, of some parts of Asia, and of the south of Europe, not truly indigenous in Britain, although now naturalised, and often occurring in cornfields, which is the case also in many parts of the world. The most common variety of the flax plant has a very slender erect stem, two or three feet high, branching only near the top, so as to form a loose corymb of flowers. The leaves are small, distant, and lanceolate: the flowers of a beautiful blue, rarely white, rather broader than a sixpence; the petals slightly notched along the margin; the sepals ovate, 3-nerved, ciliated, destitute of glands; the capsules scarcely longer than the calyx, not bursting open elastically, but firmly retaining their seeds, which are dark brown, glossy, oval-oblong, flattened, with acute edges, pointed at one end, and about a line in length. Another variety, however, is cultivated to some extent in many parts of Europe, so different, that some botanists account it a distinct species (*L. humile* or *L. crepitans*), which is less tall, is more inclined to branch, and is particularly distinguished by its capsules, twice as long as the calyx, and bursting open elastically when ripe. The seeds are also larger and paler. This variety is called *Springlein* and *Klanglein* by the Germans, the one name referring to the elastic bursting of the capsules, the other to the sound which accompanies it. The former variety is known to them as *Winterlein*, being often sown in the end of autumn in elevated districts where the summer is too short for spring-sown flax, and also as *Schliesslein* and *Dreschlein*, from its close capsules and the thrashing needed to separate the seed. The *Springlein* produces a finer, whiter, and softer fibre than the other, but shorter, and it is therefore not so extensively cultivated. There are many sub-varieties, to which and their different qualities no such attention has been paid, in Britain at least, as to those of other important cultivated plants.

This plant is highly valuable both for the fibres of its inner bark and for its seeds. The fibres of the inner bark, when separated both from the bark and from the inner woody portion of the stem, are FLAX or LINT, the well-known material of which LINEN thread and cloth are made, and used equally for the finest and for the coarsest fabrics, for the most delicate cambric or exquisite lace, and for the strongest sail-cloth. The seeds yield by expression the *drying* fixed oil called LINSEED OIL, so much used for mixing paints, making varnishes, &c.; whilst the remaining crushed mass is the Linseed Cake, or OIL-CAKE, greatly esteemed for feeding cattle, and when ground to a fine powder, becomes the LINSEED MEAL so useful for poultices. Linseed is sometimes used in medicine, as an emollient and demulcent in irritations of the pulmonary and of the urinary organs, and of the mucous membranes generally, deriving its value for this purpose from a mucilage which it contains, and which is extracted by hot water, making *linseed tea*. The fibre of flax is the ultimate material from which paper is made, and linseed oil is used in the manufacture of printers' ink. No plant not yielding food is more useful to man than the flax plant.

It has been cultivated from the earliest historic times. It is mentioned in the book of Genesis as one of the productions of Egypt in the time of the Pharaohs; and it has been recently ascertained by microscopic examination, that the cloth in which the mummies of Egypt are enveloped is linen. Solomon purchased linen yarn in Egypt. Herodotus speaks of the great flax trade of Egypt. Great quantities of flax are grown in that country at the present day; its cultivation is also very extensively carried on in some parts of Europe and of North America. The proportion of flax to other crops in Britain is probably smaller at present than it was at a former period, but an increase of its cultivation has been strongly recommended by persons whose opinion is entitled to great regard, and particularly in Ireland, where, however, it is more extensively cultivated than either in England or Scotland. It has the advantage of giving employment not only to an agricultural but to a manufacturing population. Flax is more extensively and more successfully cultivated in Belgium than in any other European country, particularly in Southern Brabant, Hainault, and West and East Flanders, in which the most beautiful flax in Europe is produced, employed for the manufacture of the famous Brussels lace, and sold for this purpose at about £100 to £180 per ton, the crop when prepared for the market sometimes exceeding in value the land on which it was produced. The village of Rebeque is distinguished for the production of this precious flax. The greatest care is bestowed on its cultivation, and to this its excellence is probably in a great measure to be ascribed. Not a weed is to be

seen, and the care and labour are equal to those of gardening. Flax is extensively grown in the countries on the southern shores of the Baltic, and both the fibre and seed are largely imported from them into Britain. Besides the flax raised at home, Great Britain annually imports from 80,000 to 90,000 tons of this material.

Flax has been cultivated from time immemorial, as a winter crop, in India, but only for its seed, and not at all for its fibre. This remarkable circumstance is supposed by Dr Royle to be owing to the existence of the cotton plant in that country, the fibre of which more readily offers itself to view on the bursting of the pod. But Dr Royle also states his opinion, that the climate of the greater part of India is unsuitable for the production of the fibre of flax; and the variety cultivated in India is only about a foot or eighteen inches in height, much branched, and yielding a very worthless fibre, whilst it is loaded with capsules, and the seeds yield a larger proportion of oil than those of flax grown in Europe. It is sometimes sown as an edging around fields.

Much depends on the thickness of sowing. Flax must be sown thick to yield a fine fibre; but when intended to produce a fibre for coarser purposes, the plants ought to have more room. For the finest fibre, also, they must be pulled before the seed is ripe; but a coarser fibre and a crop of linseed are often much to be preferred by the farmer. The crop is always *pulled* up by the roots.

The diminished cultivation of flax in Britain, after agriculture began to improve, is to be ascribed in part to the prevalence of the opinion, that it is a very exhausting crop for the land. This has been said to be particularly the case when the seed is ripened. But the introduction of new manures has rendered this objection less important than it formerly was; and it has been found that the refuse of flax itself is not a bad manure, and that the water in which it has been steeped is a good liquid manure. The water of flax-steeping pits or ponds is often strong enough to kill the fish of rivers into which it is allowed to flow.

The capsules (*bolls*) of flax are torn off, after it is pulled, by a sort of combing called *rippling* (see FLAX-DRESSING). Great care is requisite to dry them, and to keep them perfectly dry. For the subsequent processes, see LINSEED.

Besides the common flax, several other species are occasionally cultivated for their fibre, but are comparatively of very little value.

The *Linaceæ* are, in general, plants of elegant appearance and with flowers of much beauty; some of them have flowers larger than common flax, and some are not unfrequent ornaments of our green-houses. *Radiola millegrana*, All-seed, is one of the smallest of British phanerogamous plants.

PURGING FLAX (*Linum catharticum*) is a graceful little annual with branching stem, opposite leaves, and small white flowers, common in fields and meadows throughout Britain and most parts of Europe. It possesses purgative and diuretic properties, owing to the presence of a substance which has been called *linin*. As a domestic medicine, a handful of the fresh herb is often administered, infused in whey; and it has a popular reputation in rheumatism.

FLAX, NEW ZEALAND, a valuable fibre quite different from common flax, and obtained from the leaf of an endogenous, instead of the stem of an exogenous plant. The plant yielding it is *Phormium tenax*, often called New Zealand Flax, and sometimes Flax Lily and Flax Bush. It belongs to the natural order *Liliaceæ*, and is a perennial plant, a native of New Zealand and Norfolk Island; its leaves resemble those of an Iris, are from two to six feet long and one to two or three inches broad. The flowers are produced in a tall branched panicle; are numerous, brownish yellow, not very beautiful; the fruit is a three-cornered capsule with numerous compressed jet-black seeds. The fibre of the leaves is both very fine and very strong, and was used by the New Zealanders, before their country was discovered by Europeans, for making dresses, ropes, twine, mats, cloth, &c. New Zealand Flax is

New Zealand Flax (*Phormium tenax*).

imported into Britain for making twine and ropes; and the plant is cultivated in its native country. Its cultivation has also been attempted in some parts of Europe; but the winters of Europe, except in the south, are too cold for it. To obtain the fibre, the leaves are cut when they have attained their full size, and usually macerated for a few days in water. But the New Zealanders procure the fibre in its greatest perfection, very long and slender, shining like silk, by a more laborious process, and without maceration, removing the epidermis from the leaf when newly cut, separating the fibres by the thumb-nails, and then more perfectly by a comb.

The roots are purgative, diuretic, sudorific, and expectorant; a good substitute for sarsaparilla.—The leaves, when cut near the root, exude a viscid juice, which becomes an edible gum.—The New Zealanders prepare a sweet beverage from the flowers.

FLAX-DRESSING. When the seeds are beginning to change from a green to a pale brown, is the best time for pulling flax. Where the crop grows of different lengths, these lengths should be pulled and kept separately, uniformity in this respect being of great value in the after processes.

The process first gone through after pulling is *rippling*—which consists in tearing off the bolls by

ıe stalks through a series of iron teeth 18 ag, placed within a distance of half an ach other. These are fastened in a block which is placed at the end of a plank or on which the operator sits.

xt process is to obtain the flaxen fibre or rom the woody core, or *boon*, of the stem. ffected by steeping the bundles in water ioon begins to rot, in which state it is parated from the fibre. The operation is ing or *retting*, and requires to be managed t care, as by continuing it too long, decom- night extend to the fibre, and render it while by discontinuing it too soon, the could not be effected with sufficient ease. is generally determined by the nature erature of the water, and the ripeness of decomposition taking place more rapidly agnant water than in running streams, in retting is sometimes conducted. After iciently steeped, the flax is spread out on to rectify any defect in the retting, and to dry it for the breaking. In some it is the practice to conduct the retting on the grass—a process known as dew- contradistinction to water-retting. This and less offensive method, but it requires ger time, and in a country where land is would become very expensive. On the mixed method of retting is preferable— steep till decomposition of the boon is nced, and then to complete the process on

It has been attempted to separate the nachinery, without subjecting the flax to out the article so produced has hitherto ted as inferior in quality.

id the delays and uncertainty dependent old processes of retting or watering, plans recently introduced, bringing the opera- under control, like the other processes of ufactures. The methods which have been and are now working with success, are Schenk's and Watt's. By the first of flax is placed in vats, in which it is n by means of strong framework. Water to pass into the vats, to become absorbed ax: steam is next admitted, till the tem- of the water is raised to, and maintained 90°. Acetous fermentation ensues in a s; and after being maintained for about urs, the decomposition of the gummy or matter in the stalk is completed. The water is next withdrawn from the vat, and taken out, separated and dried either in air or in desiccating rooms, according to nces. In Watt's process, the flax is placed under provided with a perforated false the top is double, and filled with water to act enser. Steam being admitted to the case, result is the freeing of the flax from certain ils. The steam rising to the top of the is condensed by contact with it, and falls s on the flax beneath—a decoction of the matter is thus obtained. In 36 hours, ss is completed; and the flax taken out, is tween rollers in the direction of its length, sses out the water and decomposed gum, and flattens the straw. By this process, he plant takes from the land is saved the ng available as food for animals, and the refuse water as manure.

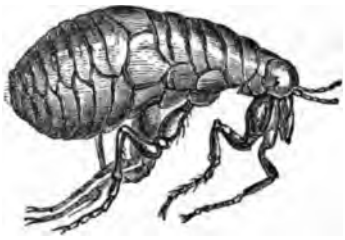
ed by either of the plans, the flax is now be freed completely of its woody particles. effected by *scutching*. Previous to this, the flax is passed through a *brake* or rollers, in order thoroughly to crack the boon. The brake, worked by manual labour, consists of a frame, in the upper side of which are a number of grooves; a movable piece is hinged at one end, and provided with a similar grooved piece on its lower side, but so placed that the projections pass into the hollows of the lower. The flax, placed between these, and struck by bringing down the hinged part, is broken, but the fibre remains uninjured.

In the flax-breaking machine, the flax is passed through a series of horizontal fluted rollers; the flutes do not touch, thus preserving the fibre while breaking the boon. In continental countries, scutching is almost invariably performed by hand, the flax being held in a groove made in an upright stand, and struck by a flat blade. Machine-scutching is much more certain and expeditious than hand-scutching, and is, in consequence, fast superseding it in this country. After passing through the breaking-machine, the flax is subjected to the action of a series of knives, attached to the arms of a vertical wheel; these knives strike the flax in the direction of its length. The process is gone through three times before the flax is ready for the market. Although machine-scutching is expeditious, it is not capable of that pliant adaptation to the varying nature of the flax to be operated upon, which is obtained in hand-scutching. The effect of machine-scutching is to produce fineness by reducing and impairing, rather than sustaining, the character of the fibre—namely, the length and fineness of its 'staple' or fibre. To remedy these defects, scutching by means of revolving brushes has been introduced. This divides the fibre without tearing it. The subsequent manufacturing operations will be noticed under LINEN MANUFACTURE.

FLAXMAN, JOHN, the greatest of English sculptors, was born at York, 6th July 1755. At the age of 15, he became a student in the Royal Academy, but never worked in the studio of any master. In 1782, he married Miss Ann Denman, a lady of superior gifts and graces, who soon began to exercise a beneficial influence upon his studies. Accompanied by her, he went in 1787 to Italy, where, by degrees, he attracted the attention of all lovers of art. This was still more the case after his return to London in 1794. He was elected an Associate of the Royal Academy in 1797; Royal Academician in 1800; and, in 1810, was appointed Professor of Sculpture to that institution. After the death of his wife in 1820, he withdrew from society, and died 7th December 1826. F.'s most celebrated works are his 'Outlines to Homer's Odyssey' (Rome, 1793), and 'The Iliad' (Lond. 1795), and his illustrations of Dante and Æschylus. Many of his works display wonderful grandeur of composition, and a pure and noble style. He was one of the first of those who, following the example of Winckelmann, strove to penetrate to the true spirit of antique art, in opposition to the false taste of the time. The study of vase-paintings, and of the Pompeian mural pictures, then just revived, led him to abandon the sickly mannerism of his predecessors for the severe simplicity of the antique, and he may with justice be styled the author of modern *rilievo* (see ALTO-RILIEVO). His works are not, however, all of equal value, and, in general, it may be said that his skill in modelling was not equal to his inventive genius. The poetry of his conceptions is of a high order. F. contributed much towards bringing the outline style, now so popular, into general use. Of his sculptures, the best known in England are his bas-relief monument to the poet Collins at Chichester, the monument to Lord Mansfield, and that to the Baring family at Micheldean Church, in Hampshire. His model for the shield of Achilles, taken from

the 18th book of the *Iliad*, is particularly worthy of admiration. F.'s private collection is now in University College, London, in the gallery known as *Flaxman Hall*.

FLEA (*Pulex*), a Linnæan genus of apterous insects, now commonly regarded by entomologists as constituting a distinct order, *Suctoria*, *Siphonaptera*, or *Aphaniptera*. The species are not numerous, and little subdivision of the genus has been attempted. It has been suggested as probable, that further investigation may lead to a recognition of the fleas as belonging to some of the larger orders, with parts modified to suit their parasitical life. All the species are very similar to the COMMON FLEA (*P. irritans*), which is plentiful in all parts



Common Flea (*Pulex irritans*), magnified.

of the world, living by sucking the blood of man, and of some species of quadrupeds and birds. It abounds particularly in the nests of poultry, pigeons, and swallows, and wherever sand and dust accumulate in the chinks of floors, &c; it is to be found also plentifully in beds, wherever cleanliness is neglected. The abundance of fleas in some countries is an intolerable nuisance to travellers, and also to residents. Such is said to be particularly the case in many parts of Australia, where the general dryness and warmth encourage their growth to an extent against which the precautionary measures of housewives are almost entirely unavailing. The female flea is rather larger than the male, but the sexes are otherwise very similar. The head is small, very compressed, rounded above, and has on each side a small round eye. The mouth has two lancet-like mandibles, the maxillæ being represented by two conical scales, the mandibles and maxillæ forming a suctorial beak, with a slender bristle-like tongue, the whole enclosed between two three-jointed plates. The thorax consists of three segments, the second and third of which bear a scale on each side; the scales are regarded as rudimentary wings. There is no marked division between the thorax and the abdomen, which consists of nine segments, much larger than those of the thorax, but much compressed. The whole body is covered with a tough integument. The activity of the flea, its power of leaping, and its extraordinary strength, are well known. Its strength has sometimes been applied to the drawing of miniature carriages, cannon, &c., which the public have been invited to witness through a magnifying-glass, as an amusing spectacle. Fleas undergo a complete metamorphosis. The female lays about a dozen eggs of a white colour, and slightly viscous. The larva is a lively little worm, at first white, afterwards reddish, and destitute of feet. When about to change into a pupa, it encloses itself in a little silk cocoon, from which emerges the perfect flea. Cleanliness and careful attention are the principal means of keeping beds and houses free of fleas; but where these are found insufficient, as is apt to be the case in some climates, and in cottages where there is much wood-work with gaping joints, certain strongly aromatic plants are employed, of which the odours appear to be detestable to them, as the different *Compositæ* known by the name of fleabane, and also wormwood, the merits of which last are thus extolled by Tusser:

'While wormwood hath seed, get a handfull or twaine,
To save against March, to make flea to refraine;
Where chamber is sweeped, and wormwood is strown,
No flea for his life dare abide to be known.'

Other species of fleas infest particular animals, as the dog, fox, mole, &c.—The Chigoe (q. v.), or Jigger of the West Indies, nearly allied to the true fleas, is far more troublesome than any of them.

FLEA'BANE (*Pulicaria*), a genus of plants of the natural order *Compositæ*, sub-order *Corymbifera*, having hemispherical imbricated involucres and yellow flowers; the whole plant emitting a peculiar aromatic smell, sometimes compared to that of soap, which is said to be efficacious in driving away fleas.

Fleabane (*Pulicaria dysenterica*):
a, root; *b*, top of stem, with leaves and flowers; *c*, achene, with pappus; *d*, pistil; *e*, a floret of the disc; *f*, a stamen; *g*, a floret of the ray.

Two species are found in England, one of which (*P. dysenterica*), common in moist places, with oblong leaves, stem 12—15 inches high, cottony, and bearing panicled flowers, has a considerable reputation in diarrhœa and dysentery. The Russian soldiers, in the expedition to Persia under General Keith, were much troubled with dysentery, which was cured by this plant.—*Conyza squarrosa*, also called fleabane, belongs to a nearly allied genius.

FLECHE, LA, a town of France, in the department of Sarthe, is agreeably situated on the right bank of the Loir, 24 miles south-south-west of Le Mans. It is a well-built town, and has three principal streets, which are wide and well paved. Its principal building is the military school, with a library of 15,000 volumes, destined for the education of the sons of poor officers, or of soldiers who have highly distinguished themselves. The building now occupied by the school was once a royal palace, and was built by Henry IV. It was subsequently given by him to the Jesuits, and used by them as a Jesuit college. Here Prince Eugene, Descartes, and Picard the astronomer, were educated. F. has some trade in corn, hay, and wine, also manufactures of linen, hosiery, and gloves. Pop. 7150.

FLE'CKNOE, RICHARD, the date of whose birth is unknown, is said to have been an Irish Roman

priest. He came to London, mingled in of the wits, and wrote several plays, all are now forgotten. He died in 1678. F. der the lash of Dryden, whose satire, *Mac Flecnoe*, is partly the model of Pope's (q. v.), and will be remembered as long as satirist is remembered. From those who inted with our extinct literature, we have ance that F. has been hardly dealt with; gh he did not rise to the rank of Dryden t, he was the author of several fugitive rt without grace, fancy, and happy turns sion. Among his dramatic pieces are *or the Chaste Lady; Love's Dominion* in 1654, and dedicated to Cromwell's daughter, Mrs Claypole); and *The Mar-Oceanus and Britannia*. His *Miscellanea, of all Sorts*, appeared in 1653.

T (that which floats), a collection of ships, f war or commerce, for one object or for one n. The diminutives of fleet are 'division' dron.' In the royal navy, a fleet is ordi- command of an admiral or vice-admiral.

T MARRIAGES. The practice of con- clandestine marriages was very prevalent nd before the passing of the first mar- (see MARRIAGE). The chapels at the ul at May Fair, in London, were long or the performance of these marriages; other place was equal in notoriety for mous traffic to the Fleet Prison. It observed, that before the passing of the II. c. 33, there was no necessity in Eng- any religious ceremonial in the perform- marriage, which might be contracted by bal consent. Hence it was not in virtue ecial privilege existing within the liberty et that marriages at that place became so but rather from the fact, that the persons they were performed, having nothing to r in money or character, were able to set e the penalties enacted from time to time iew to restrain this public nuisance. The ring which these marriages were in greatest as from 1674 to 1754. The first notice of a riage is in 1613, in a letter from Alderman Lady Hickes, and the first entry in a register 4. Up to this time, it does not appear marriages contracted at the Fleet were e; but in the latter year, an order having ed by the ecclesiastical commissioners e performance of clandestine marriages in and May Fair, the Fleet at once became rite resort for those who desired to effect marriage. At first, the ceremony was l in the chapel in the Fleet; but the ns became so frequent, that a regular trade sprung up. By 10 Anne, c. 19. s. 176, in chapels without banns were prohibited tain penalties, and from this time, rooms ed up in the taverns and the houses of parsons, for the purpose of performing ony. The persons who celebrated these were clergymen of the Church of England, been consigned for debt to the prison of . These men, having lost all sense of their ing, employed touters to bring to them sons as required their office. The sums marriage varied according to the rank of s, from half-a-crown to a large fee where ality and the purse combined to afford a ard. During the time that this iniquitous s at its height, every species of enormity tised. Young ladies were compelled to ainst their will; young men were decoyed into a union with the most infamous characters; and persons in shoals resorted to the parsons to be united in bonds which they had no intention should bind them, and which were speedily broken to be contracted with some new favourite. The sailors from the neighbouring docks were steady patrons of this mode: it was stated by the keeper of one of the taverns, that often, when the fleet was in, two or three hundred marriages were contracted in a week. Persons of a more respectable character also at times resorted to the Fleet. Thus the Hon. Henry Fox was here married to Georgina Caroline, daughter of the second Duke of Richmond. Pennant thus describes the neighbourhood of the Fleet in his time: 'In walking along the street in my youth, on the side next the prison, I have often been tempted by the question: "Sir, will you be pleased to walk in and be married?" Along this most lawless space was hung up the frequent sign of a male and female hand conjoined, with "marriages performed within" written beneath. A dirty fellow invited you in. The parson was seen walking before his shop, a squalid, dirty figure, clad in a tattered plaid night-gown, with a fiery face, and ready to couple you for a dram of gin or a pipe of tobacco.' —*London*, p. 193. Registers of these marriages were kept by the various parties who officiated. A collection of these books, purchased by government in 1821, and deposited in the Consistory Court of London, amounted to the incredible number of between two and three hundred large registers, and upwards of one thousand smaller books, called pocket-books. These registers were not received as evidence in a court of law (*Doe d Davies v. Gatacre*, 8 Carr. and P. 578), not because the marriage was invalid, but because the parties engaged in the ceremony were so worthless that they were deemed undeserving of credit. Various attempts were made to stop this practice by acts of parliament. By 6 and 7 Will. III. c. 52, and again by 7 and 8 Will. III. c. 35, penalties were imposed on clergymen celebrating any marriage without banns; but these provisions were without effect upon men who had nothing to lose. At length, the nuisance became intolerable, for, owing to the difficulty of proving these marriages, respectable parties, who in folly had entered into them, found it often impossible to establish their marriage, and the greatest confusion was in consequence produced. The act of the 26th Geo. II. c. 33, was therefore passed, which struck at the root of the matter by declaring that all marriages, except in Scotland, solemnised otherwise than in a church or public chapel, where banns have been published, unless by special licence, should be utterly void. This act met with strenuous opposition in the House of Commons, especially by Mr Fox, who had been himself married in the Fleet, but ultimately it was passed into a law. The public, however, were unwilling to surrender their privilege, and on the 26th March 1754, the day before the act came into operation, there were no less than 217 marriages entered in one register alone. See Burn's *History of Fleet Marriages*, to which we are indebted for many of the above particulars.

FLEET PRISON, a celebrated London jail, which stood on the east side of Farringdon Street, on what was formerly called Fleet Market. The keeper of it was called the Warden of the Fleet. It derived its name from the Fleet rivulet, so named from its rapidity, which flowed into the Thames. By the Act 5 and 6 Victoria, the Fleet Prison and the Marshalsea were abolished, and their functions transferred to the Queen's Bench, under the new name of the Queen's Prison. The Fleet was the king's prison so far back as the 12th c., and a receptacle for debtors since about the same period. The

blow-fly (q. v.). The forehead is rust-coloured, the thorax grayish, the abdomen blue with three black bands. The expanse of wings is nearly one inch. It is abundant throughout Britain and Europe generally, and deposits its eggs on flesh, for which purpose it often enters houses, having a remarkably delicate sense of smelling. The maggots are of very frequent occurrence on meat in summer, notwithstanding all care that can be taken.—A nearly allied species (*M. Cæsar*) is distinguished by its golden green colour, and is also common in Britain. It is found in houses from the beginning of spring to the end of autumn. Another (*M. lardaria*), with silky tawny face, a black stripe on the crown, thorax glittering white with four black stripes, and abdomen bluish-gray, tesselated with black, is most common in the end of autumn, frequenting bushes of ivy and late flowers, and is also a pest of the larder.

FLE'TA, the title of a valuable treatise on the law of England. It is not known by whom this treatise, which is one of the earliest authorities on English law, was written, and it derives its title from the circumstance that it was written in the Fleet prison. Lord Campbell remarks—*Lives of the Chancellors*, i. 166 and note: 'I shall rejoice if I do tardy justice to the memory of Robert Burnel, decidedly the first in this class, and if I attract notice to his successors, who walked in his footsteps. To them, too, we are probably indebted for the treatises entitled *Fleta* and *Britton*, which are said to have been written at the request of the king, and which, though inferior in style and arrangement to Bracton, are wonderful performances for such an age. *Fleta* must have been written after the 13th year of the king (Edward I.), and not much later; for it frequently quotes the statute of Westminster the second, without referring to the later statutes of the reign.

FLETCHER, Andrew, of Salton, a celebrated Scottish patriot and politician, was the son of Sir Robert Fletcher and Catherine Bruce, daughter of Sir Henry Bruce of Clackmannan. He was born in 1653. Notwithstanding the strong anti-English feelings which characterised him through life, F. was of English descent by the father's side; his father being the fifth in the direct line from Sir Bernard Fletcher of the county of York. But his mother was of the royal House of Scotland, the first of the Clackmannan family having been the third son of the Lord of Annandale, Robert de Bruce, who was the grandfather of the great King Robert. F.'s father, who died in his childhood, consigned him to the care of Gilbert Burnet, then minister of Salton, afterwards the well-known Bishop of Salisbury; by whom he was instructed not only in literature and religion, but in those principles of free government of which he afterwards became so zealous an advocate. So early as 1681, when he sat in parliament for the first time as commissioner for East Lothian, F. offered so determined an opposition to the measures of the Duke of York (afterwards James II.), then acting as the Royal Commissioner in Scotland, that he found it necessary to retire, first into England, and then into Holland. He there entered into close alliance with the English refugees, who had assembled in considerable numbers; and on his return to England in 1683, he shared the counsels of the party of which Russell, Essex, Howard, Algernon Sydney, and John Hampden (the grandson of the still more famous patriot of the same name) were the leaders. Though usually regarded as a republican, F.'s political creed, like that of Algernon Sydney, approached far nearer to aristocracy than to democracy in the modern sense; for though he was disposed to restrict the monarchical element of the constitution within the narrowest limits, if not to abolish it altogether, he was so far from being an advocate for a universal participation in political rights, that one of his favourite schemes for the reformation of the hosts of vagrants and paupers by whom Scotland was infested in his day, consisted in the establishment of slavery in the form in which it had existed in the classical nations of antiquity. On the discovery of the Rye House plot, F. returned to Holland. His next visit to England was as a volunteer under the unfortunate Duke of Monmouth in 1685; but he was compelled to leave the insurgent army, at the beginning of the enterprise, in consequence of his having shot the mayor of Lynn, with whom he had had a personal quarrel about a horse. The next hiding-place which F. selected was Spain; but he had no sooner arrived, than he was thrown into prison at the instance of the English ambassador, and would have been transmitted to England, to share the fate of his fellow-patriots, had he not been mysteriously delivered from prison by an unknown friend. From Spain he proceeded to Hungary, where he entered the army as a volunteer, and greatly distinguished himself. He returned to England at the Revolution. A few years later, he met in London, accidentally, it should seem, the famous William Paterson, the founder of the Bank of England, and the projector of the Darien Expedition in London; and it was at F.'s solicitation that Paterson came to Scotland, and offered, to the acceptance of his countrymen, a project which he had originally intended should be carried out by the far greater resources either of the trading communities of the Hanse towns, or of the princes of the German empire. The bitterness caused by the treatment which the Darien colonists received at the hands of King William's government, tended to confirm F. and his friends in their opposition to the Union with England, and led to his delivering in parliament those spirited harangues in favour of an exclusive Scottish nationality, which still stir the blood of his countrymen. After the Union, he retired in disgust from public life, and died in London in 1716. F.'s writings originally appeared in the form of tracts, and anonymously; they were, however, collected and reprinted at London in 1737, under the title of *The Political Works of Andrew Fletcher, Esquire*.

FLETCHER, Giles and Phineas, were the sons of Dr Giles Fletcher, Queen Elizabeth's ambassador to the court of Russia, and cousins to Fletcher the dramatist.

Giles, the elder, was born about 1580; he was educated at Cambridge, and died at his living at Alderton in 1623. His chief poetical work is a sacred poem, entitled *Christ's Victory and Triumph*, which appeared at Cambridge in 1610. This poem, although once admired, is now unknown to general readers, and is chiefly remarkable for having, to some extent, moulded the majestic muse of Milton.

Phineas, the younger brother of Giles, was born about 1584, educated at Eton and Cambridge, and became rector of Hilgay, in Norfolk, in 1621, and died there in 1660. His most important poem, the *Purple Island, or the Isle of Man*, was published in 1633. It contains an elaborate description of the human body and mind—the former being given with great anatomical minuteness. The mind is represented as being beleaguered with the vices, and likely to be subdued, when an angel comes to the rescue—the angel being James I. Although to a large extent formal and pedantic, the *Purple Island* abounds in fine passages, in which the lusciousness of Spenser and the gravity of Milton are curiously mingled.

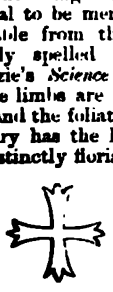
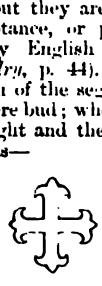
:UR-DE-LIS. Authorities are divided as to
r this celebrated emblem is derived from the
ily of the garden, or from the flag or iris,
which, as generally represented, it
more resembles both in form and
colour. 'Ancient heralds,' says Newton
(*Display*, p. 145), 'tell us that the
Franks of old had a custom, at the
proclamation of their king, to elevate
him upon a shield or target, and place
e-Lis. in his hand a reed or flag in blossom,
instead of a sceptre; and from thence
gs of the first and second race in France
resented with sceptres in their hands like
with its flower, and which flowers became
morial figures of France.' However this
e, or whatever may be the value of the
endary tales, such as that a blue banner,
lered with golden fleurs-de-lis, came down
eaven; that an angel gave it to King
at his baptism, and the like; there can
e doubt that, from Clovis downwards, the
f France bore as their arms first an inde-
umber, and latterly three golden lilies on a
ld, or, as heralds would say, azure, three
e-lis, Or—It was Charles VI. who reduced
ad hitherto been the indefinite number of
e-lis to three, disposed two and one; 'some
re upon account of the Trinity, others
represent the three different races of the
f France.'—Nisbet, i. 383. Many English
otch families bear the fleur-de-lis in some
of their shield, and generally with some
e to France.

URUS, a small town of Belgium, in the pro-
Hainault, is situated north of the left bank
Sambre, and 15 miles west of Namur: pop.
200. It has been the scene of several con-
e last and most important, however, being
le of F., fought here 26th June 1794, between
ny of the French Republic, consisting of
troops, under Jourdan, and the allies, who
aferior in numerical strength, under the
of Saxe-Coburg. The latter leader gave
for a retreat at the very moment when a
advance might have decided the victory
favour, and the result was, that Jourdan
abled to unite his army with those of the
, the Ardennes, and the North, and that the
rces were compelled for a time to evacuate
s.

URY, FLORY, FLOWRY, FLEURETTE,
eraldry, signifies that the object is adorned
urs-de-lis; a cross-fleury, for example, is a
e ends of which are in the form of fleurs-
There are several varieties in the modes
esenting these crosses, which has led to
ions being made between them by heralds
ial to be mentioned: but they are all dis-
nable from the cross-potance, or potancée,
tly spelled patonce by English heralds.
azie's *Science of Heraldry*, p. 44). In the
he limbs are in the form of the segments of
and the foliation is a mere bud; whereas the
ury has the limbs straight and the termin-
istinctly floriated. Thus—



Cross-potance.



Cross-fleury.

Perhaps, the most celebrated instance of this bearing, is in the case of the double prepuce flowery and counter-flowery gules which surrounds the red lion in the royal arms of Scotland, and which Charlemagne is said to have conferred on Achaius, king of Scotland, for assistance in his wars. The object, according to Nisbet (ii. 101), was to shew that, as the lion had defended the lilies of France, these 'hereafter shall continue a defence for the Scots lion, and as a badge of friendship, which has still continued.' That the lilies were assumed in consequence of the intimate relation which prevailed between France and Scotland for so many generations, will not be doubted; but the special occasion of the assumption may not be admitted in our day to be quite beyond the reach of scepticism, notwithstanding Nisbet's assertion that it is so fully instructed by ancient and modern writers that he need not trouble his readers with a long catalogue of them.

FLEURY, Claude, a French church historian, was born at Paris, 6th December 1640, and was educated at first for the law, but preferring an ecclesiastical career, subsequently took priest's orders. In 1672, he became tutor to the young Prince de Conti, who was brought up along with the dauphin, and at a later period, to the Comte de Vermandois, natural son of Louis XIV. After the death of the Comte in 1683, the French monarch appointed him, under Fenelon, tutor to the Princes of Burgundy, Anjou and Berri, and also abbot of the Cistercian monastery of Loc-Dieu. When the princes had completed their education, F. was rewarded with the priorate of Argenteuil. The Duke of Orleans selected him for confessor to the young king, Louis XV., giving as his reason for so doing, that F. was neither Jansenist, nor Molinist, nor Ultramontanist, but Catholic. F. held this office till 1722, when the infirmities of age compelled him to resign it. He died 14th July 1723. F. was as learned as he was modest, and as mild and kind-hearted as he was simple in his manners, and upright in his conduct. Among his numerous works may be mentioned, *Mœurs des Israélites* (Paris, 1681); *Mœurs des Chrétiens* (Paris, 1662); *Traité du Choix et de la Méthode des Etudes* (Paris, 1686); *Institution au Droit Ecclesiastique* (1687); and, above all, the *Histoire Ecclesiastique* (20 vols., Paris, 1691–1720). On this work, F. laboured thirty years. It is marked by great learning, and, on the whole, by a judiciously critical spirit. What may be called his professional sympathies, are held in check by a noble desire to be impartial, which might well put to the blush the unveracious partisanship of many Protestant writers. Semler (q. v.), an eminent German theological professor, avowed that his lectures were at first mainly extracts from the *Histoire Ecclesiastique*. Even Voltaire praised it. 'The history of F.,' says he, 'is the best that has ever been executed.' D'Alembert, and many others, recommend F.'s style as a model of elegant simplicity. The so-called *Abrégé de l'Histoire Ecclesiastique de Fleury*, published at Berne in 1776, is ascribed to Frederic the Great. A posthumous work of F.'s, entitled *Discours sur les Libertés de l'Eglise Gallicane*, has always been very popular.**

FLEXURE, or **FLEXION**, is the bending or curving of a line or figure (see **Curvature**). A curve is said to have a point of *contrary* flexure at the point where it changes its character of concavity or convexity towards a given line. In the art of building, flexure denotes the bending of loaded beams. If a beam, supported at its two ends, be loaded, it bends, its lower surface becoming convex, and its upper concave. In this bending, the particles

in the lower surface are drawn away from each other, and those in the upper are more closely packed together, while between the surfaces there is a line called *the line of no disturbance*, wherein the particles are neither drawn asunder nor compressed, and from which the mathematical theory of the flexure of beams starts. Experiments shew that the flexure of solid beams, supported at their ends, and loaded, varies—(1.) directly as the load; (2.) inversely as the product of their *breadths*, and the cube of their *depths*; and (3.) directly as the cube of the distance between the supports, while the flexure, if the load be uniformly distributed over the beam, is $\frac{5}{8}$ths of the amount produced by the load placed on its centre. See STRENGTH OF MATERIALS.

FLIES, SPANISH OR BLISTERING. See CANTHARIS.

FLINDERS, MATTHEW, an adventurous English navigator, to whom we are indebted for a correct knowledge of a great portion of the Australian coasts, was born at Donington, in Lincolnshire, 1760. He entered the merchant service at an early age, and subsequently the royal navy. In 1795, the vessel in which he was midshipman conveyed the governor of New Holland to Botany Bay; and while there, F. determined to investigate the coast south of Port Jackson, about 250 leagues of which were laid down in the charts as 'unknown.' With an equally daring and ambitious young surgeon in his ship, called Bass, he departed on the enterprise in a small decked vessel, with a crew of only six men. Their chief discovery was the straits between Van Diemen's Land (now Tasmania) and the mainland of Australia, which were named after Bass. In 1801, F. obtained from the British government the command of a scientific expedition for the investigation of the Australian coasts and their products. Commencing his examination at Cape Leuwin, F., in the course of two years, gradually explored the coast to Bass's Straits, thence northwards—laying down carefully the Great Barrier Reefs—to the Gulf of Carpentaria, which he thoroughly surveyed across to Timur, then back to Cape Leuwin, and round the south coast to Port Jackson. In 1810 he was liberated from a six years' imprisonment by the French in the Isle of France, returned to England, and gave the world the result of his researches in a work, entitled *A Voyage to Terra Australia*. He died in July 1814, the day on which his book was published.

FLINDERS LAND, now South Australia (q. v.).

FLINDERSIA, a genus of trees of the natural order *Cedrelaceæ*, one species of which, *F. australis*, yields timber little inferior to mahogany. It is much used in Australia, and is there called CALLCEDRA WOOD.

FLINT, a mineral which may be regarded as a variety of quartz, or as intermediate between quartz and opal, consisting almost entirely of silica, with a very little lime, oxide of iron, water, carbon, and sometimes even traces of organic matter. It has a flat shell-like fracture, is translucent or semi-transparent, and varies in colour from a very dark brown, or almost black, to light brown, red, yellow, and grayish white, and is sometimes veined, clouded, marbled, or spotted. Dark-coloured flints are most common in the chalk, in which principally F. occurs imbedded, forming nodules of various sizes, sometimes large nodular masses, of irregular and often grotesque shape; but gravel formed of light-coloured flints is very common, and it is disputed whether or not a change of colour has taken place by exposure to atmospheric and other chemical agencies. F. is sometimes found in beds or veins. It is very abundant wherever the chalk formation extends, in England and other countries; rolled F. nodules are also often found i pound rocks, and in alluvial soils; vast tracts being sometimes full of them. F. often contain crystals of quartz. F. nodu usually moist in the interior if broken whe taken from their beds.

F. is sometimes harder than quartz, sufficie to scratch it. The readiness with which it fire with steel is well known, and it woul that the sparks are not all merely incan particles, heated by the friction, but that i of them a chemical combination of silica a takes place, causing great increase of heat use of the F. and steel for igniting tinder, common, has been almost superseded by lucifer-matches, and gun-flints have given to percussion-caps. According to Pliny, Cl the first who struck fire with flint; or mo bably, he was the first to shew its applica useful purposes; and he therefore received th *Pyrodes*. The most ancient use of F. was p for sharp weapons and cutting instruments; knives, axes, arrow-heads, &c., are among th interesting relics of rude antiquity.

At present, a principal use of F. is manufacture of fine earthenware, into th position of which it enters, being for this first calcined, then thrown into cold wat afterwards powdered.

The origin of F. is a subject of consi difficulty. Silicious deposits are sometimes a chemical operation, as in the case of the s sinter formed round the geysers of Iceland the evaporation of water largely charged wit But at the bottom of the sea, as no evap could take place, some other agent than sp water saturated with silex must have suppli materials. It is a fact of considerable impo in this inquiry, that almost all large ma limestone have thin silicious concretions, or Thus, chert is found in carboniferous and limestones, and menilite in the tertiary lim of the Paris basin. The conditions necess the deposition of calcareous strata seem to b required for the formation of silicious conc The materials of both exist in solution in sea and as it needed the foraminifer, the coral, a mollusc to fix the carbonate of lime which the chalk deposits, so the silex was secre innumerable diatoms and sponges, and their r most probably supplied the material of th The discovery by Dr Bowerbank and other scopists of the spicules of sponges and the fr of diatoms in almost every specimen of clearly shewn that F. to a large extent, entirely, owes its origin to these minute orga It is, however, difficult to account for the c that have taken place in these materials subs to their deposition.

FLINT, a parliamentary borough and in the east of Flintshire, North Wales, forme capital of the county, on the left side of the e of the Dee, 191 miles north-west of London and 12¼ miles north-west of Chester. It a rectangle like a Roman camp, and is surr by now nearly obliterated ramparts and int ments. The Dee estuary is some miles wid but is shallow and narrow at low water. of 300 tons reach the town. The principal are coal and lead from mines in the v which afford the chief employment. Pop 3540. It unites with seven other places in s one member to parliament. Roman relics and of Roman lead smelting-works have been here. On a low freestone rock in a tidal ma the remains of a castle, built by Henry 1

ilt in 1647. The double tower or keep is 40 diameter, and includes two concentric walls, feet thick, with an intervening gallery 8 feet within, is a circle 20 feet in diameter, with rances. Deterioration of the channel of the made F. in a great degree a port of Chester, e larger vessels, especially with timber, are ged, and the cargoes floated up the Dee in vessels, the timber in rafts.

VT, a river of Georgia, one of the United of America, unites on its right with the ochee, at the south-west angle of the state, the Appalachicola, which, after a course miles, enters the Gulf of Mexico. The is about 300 miles long, being practicable am-boats up to Albany, about 250 miles from the sea.

VT, TIMOTHY, REV., an American clergyman hor, was born, in 1780, at Reading, Massa-, and graduated at Harvard College. In 1802 me minister of the Congregational Church enburg, county of Worcester in that state, e remained till 1814. In the following year, me a missionary for the valley of the Missis-rhere he was engaged in itinerant preach-l teaching a school. In 1825, he returned northern states; and in 1826, published his *tions of Ten Years passed in the Valley of the ppi* (Boston, 8vo). The same year appeared s pen a novel, entitled *Francis Berrian, or ican Patriot*, purporting to be the autobio-of a New England adventurer who acted a ous part in the first Mexican revolution, the overthrow of Iturbide. In 1828, he two works: *A Condensed Geography and of the Western States in the Mississippi* (Cincinnati, 2 vols. 8vo); and *Arthur Clen-*novel (Philadelphia, 2 vols. 8vo). Another *George Mason*, or *The Backwoodsman*, and a s in 2 vols., *The Shoshonee Valley*, appeared at ati in 1830. In 1833, he edited several s of the *Knickerbocker Magazine*, and was ently editor for three years of *The Western Magazine*. His other works are: *Indian s the West* (1833, 12mo); *Lectures on Natural , Geology, Chemistry, and the Arts* (Boston, 12mo); translation of Droy's *L'Art d'être er*, with additions by translator; and *Bio-al Memoir of Daniel Boone, the first Settler ucky* (Cincinnati, 1834, 18mo). In 1835, he uted to the London *Athenæum* a series of s of the Literature of the United States. d at Salem, August 16, 1840.—His son, P. FLINT, published a volume of poetry, *The Hunter and other Poems.*

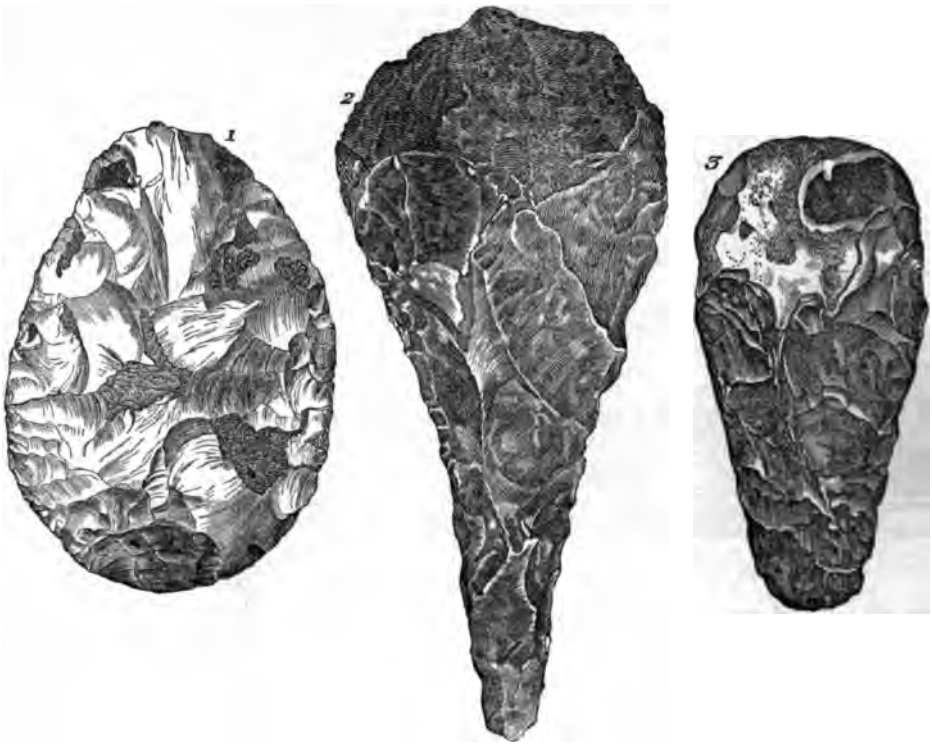
NT GLASS. See GLASS.

NT IMPLEMENTS AND WEAPONS, d to have been used by the primitive inhabit-ive from time to time, in more or less number, rned up by the plough and the spade, dug n ancient graves, fortifications, and dwelling-or fished up from the beds of lakes and in almost every country of Europe. They differ, in any material respect, from the flint ents and weapons still in use among uncivil-bes in Asia, Africa, America, and the islands Pacific Ocean. The weapons of most fre-ccurrence are arrow-heads (see ELF-ARROWS), oints, dagger-blades, and axe-heads or Celts The more common implements are knives, rasps, wedges, and thin curved or semi-plates, to which the name of 'scrapers' has ven. There is great variety, as well in the in the shape, even of articles of the same There is equal variety in the amount of skill or labour expended in their manufacture. In some instances, the flint has been roughly fashioned into something like the required form by two or three blows; in others, it has been laboriously chipped into the wished-for shape, which is often one of no little elegance. In yet another class of cases, the flint, after being duly shaped, has been ground smooth, or has even received as high a polish as could be given by a modern lapidary. Examples of all the varieties of flint weapons and implements will be found in the British Museum, in the Museum of the Royal Irish Academy at Dublin, in the Museum of the Society of Antiquaries of Scotland at Edinburgh, and above all, in the Museum of the Royal Society of Antiquaries at Copenhagen, which is especially rich in this class of remains. Representations of interesting or characteristic types may be seen in the *Catalogue of the Archæological Museum at Edinburgh in* 1856 (Edin. 1859); in Mr Wilde's *Catalogue of the Antiquities in the Museum of the Royal Irish Academy* (Dubl. 1857—1861); in Worsaae's *Nordiske Oldsager i det Kongelige Museum i Kjobenharn* (Copen. 1859); and in M. Frederic Troyon's *Habitations Lacustres* (Lausanne, 1860).

Geological discoveries have recently invested flint implements with a new interest. At Abbeville, at Amiens, at Paris, and elsewhere on the continent, flint weapons, fashioned by the hand of man, have been found along with remains of extinct species of the elephant, the rhinoceros, and other mammals, in undisturbed beds of those deposits of sand, gravel, and clay to which geologists have given the name of 'the drift.' They so far resemble the flint implements and weapons found on the surface of the earth, but are generally of a larger size, of ruder workmanship, and less varied in shape. They have been divided into three classes—round-pointed, as in fig. 1; and sharp-pointed, as in fig. 2, both being chipped to a sharp edge, so as to cut or pierce only at the pointed end; and oval-shaped, as in fig. 3, with a cutting edge all round. The first and second classes vary in length from about four inches to eight or nine inches; the third class is generally about four or five inches long, but examples have been found of no more than two inches, and of as much as eight or nine inches. In no instance has any flint implement discovered in the drift been found either polished or ground. The French antiquary, M. Boucher de Perthes, was the first to call attention to these very interesting remains, in his *Antiquités Celtiques et Antédiluviennes* (Paris, 1847—1857). But it has since been remembered that implements of the same kind were found in a similar position at Hoxne, in Suffolk, along with remains of some gigantic animal, in 1797, and at Gray's Inn Lane, in London, along with remains of an elephant, in 1715. Both these English examples are still preserved—the first in the Museum of the Society of Antiquaries at London, the second in the British Museum, and they are precisely similar in every respect to the examples more recently found in France.

To what age these remains should be assigned, is a question on which geology seems scarcely yet prepared to speak with authority. But, in the words of Mr John Evans, in his essay on 'Flint Implements in the Drift,' in the *Archæologia*, vol. xxxviii. (Lond. 1860), 'thus much appears to be established beyond a doubt, that in a period of antiquity remote beyond any of which we have hitherto found traces, this portion of the globe was peopled by man; and that mankind has here witnessed some of those geological changes by which the so-called diluvial beds were deposited. Whether these were the result of some violent rush

or waters, such as may have taken place when "the fountains of the great deep were broken up, and the windows of heaven were opened," or whether of a more gradual action, similar in character to some of those now in operation along the course of our brooks, streams, and rivers, may be matter of dispute. Under any circumstances, this great fact remains indisputable, that at Amiens, land which is now 160 feet above the sea, and 90 feet above the Somme, has, since the existence of



Flint Implements from the Valley of the Somme—Reduced.

man, been submerged under fresh water, and an aqueous deposit from 20 to 30 feet in thickness, a portion of which, at all events, must have subsided from tranquil water, has been formed upon it; and this, too, has taken place in a country the level of which is now stationary, and the face of which has been little altered since the days when the Gauls and the Romans constructed their sepulchres in the soil overlying the drift which contains these relics of a far earlier race of men.'

FLINTSHIRE, a maritime county of North Wales, bounded on the E. by Cheshire and the river Dee, on the S. and W. by Denbighshire, and on the N. by the Irish Sea. The main portion of the county is 25 miles long by 10 broad, and the larger of the two outlying portions, which lies toward the south-east of the main part, is 10 miles by 5. F. is the smallest of the Welsh counties, its area being only 184,905 acres, of which $\frac{1}{7}$th is arable. The coast, 20 miles long, is low and sandy, but on the Dee estuary fertile. A hill-range, parallel to the Dee, runs through the length of the county, and rises in Garreg to 825 feet. Another range along the south-west border of the county rises in Moel Famma, 1845 feet. The chief rivers are the Dee, Alyn, and Clwyd. The chief strata are Permian, Carboniferous, and Devonian. Coal, and ores of iron, lead, silver, copper, and zinc are the chief mineral products and exports. F. supplies a fourth of the lead produced in Britain. The soil is fertile in the plains and vales, and the staple produce is wheat, oats, barley, potatoes, cattle, cheese, and butter. Cotton is the main manufacture. The London, Chester, and Holyhead Railway skirts the east and north shores. F. contains 5 hundreds and 32 parishes. Pop. (1861) 69,870. About 215 places of worship (110 Methodists, 41 Episcopal). F. sends two members to parliament. The chief towns are Flint, formerly the county town; Mold, St Asaph, Holywell, Rhyddlan, and Hawarden. F. has traces of Roman lead-mines, is traversed by Wat and Offa's Dykes, and has some ancient castle and ecclesiastical ruins. In F., in the 7th c., Saxon invaders massacred 1200 Christian monks of the monastery of Bangor. In 796, the Saxons defeated the Welsh here with dreadful slaughter, which event gave rise to the still popular plaintive air of *Morfa Rhyddlan*.

FLINTY SLATE, of which there are beds in some parts of Scotland, and in many other countries, is an impure quartz, assuming a slaty structure. It contains about 75 per cent. of silica, the remainder being lime, magnesia, oxide of iron, &c. Its fracture is rather splintery than shell-like. It is more or less translucent. It passes by insensible gradations into clay-slate, with which it is often in most intimate geological connection. Lydian Stone (q. v.) is a variety of flinty slate.

FLOATING BATTERY is a hulk, heavily armed, and made as invulnerable as possible, used

nding harbours, or in attacks on marine
es. The most remarkable instance of their
ment was by the French and Spaniards
Gibraltar, in the memorable siege which
from July 1779 to February 1783, when ten
se vessels, carrying 212 large guns, were
t to bear on the fortress; they had sides of

g Battery used in the Russian War, 1854—185

hickness, and were covered with sloping roofs,
e the shot striking them to glance off inno-
. But their solidity and strength were
ling against the courage and adroitness of the
ers, under the gallant General Elliot, who
led in destroying them with red-hot cannon-

Steam floating batteries of iron were con-
d for the war with Russia in 1854, both by
itish and French governments; but, notwith-
g that they rendered good service before
rn, they have since been generally discarded
ier than purely defensive purposes, as too
ous for navigation, and too suffocating from
oke that collected between their decks during
—The iron-plated frigates now (1862) made
s the *Warrior*) can scarcely be regarded as
g batteries, being rather frigates of splendid
rendered almost impenetrable by sheets of
erlying their sides.

)ATING ISLANDS exist in some lakes,
ore rarely in slow and placid rivers. Not
uently, they are formed by the detachment of
s of the bank; the interlaced roots of plants
g a fabric sufficiently strong to endure the
nal buffeting of waves, and to support soil
rbage or even trees to grow in. Floating
are often formed by aggregation of drift-
n the creeks and bays of tropical rivers, and
wafted into the channel of the river when it
led or by the wind, are carried down to the
ith the soil that has accumulated, and the
tion that has established itself upon them.
re sometimes seen at a distance of 50 or 100
from the mouth of the Ganges, with living
standing erect upon them. Portions of the
l soil from the deltas of rivers, held together
e roots of mangroves and other trees, are
mes also carried out to sea after typhoons
rricanes, and ships have, in consequence,
nvolved in unexpected dangers, as amongst
the icebergs of colder latitudes. Imagination has always invested with a peculiar interest the

> Straggling plots, which to and froe doe rome
> In the wide waters;

and ancient legend did not fail to notice the floating islets of the sacred Vandimonian Lake, which were large enough to bear away cattle that were tempted upon them by their fresh green grass; and the island of the Cutulian waters, which carried on its surface a dark and gloomy grove, and was constantly changing its place. A small lake in Artois, near St Omer, is remarkable for the number of its floating islands, as are also the marshy lakes of Comacchio near the Gulf of Venice. Among the largest in the world are those of the Lake of Gerdau, in Prussia, which furnish pasturage for 100 head of cattle; and that of the Lake of Kolk, in Osnabruck, which is covered with beautiful elms. Loch Lomond was long celebrated for its floating island; it, however, can no longer boast of one, as it has long since subsided and become stationary. Floating islands are found in some lakes of Scotland, and also in Ireland, and consist for the most part of large floating masses of peat. Pennant gives a description of one which he saw in Breadalbane, the surface of which exhibited plenty of coarse grass, small willows, and even a little birch tree. More interesting to the scientific inquirer, as presenting a phenomenon not so easily explained, are those floating islands which from time to time appear and disappear in the same spot, of which there is one in the Lake of Derwentwater in Cumberland, one in the Lake Ralang in the province of Smalande in Sweden, and one in Ostrogothia. That in Derwentwater is opposite to the mouth of a stream called the Catgill; and the most probable of the many theories which have been proposed to account for it is that which ascribes it to the waters of the stream, when flooded by rains, getting beneath the interlaced and matted roots of the aquatic plants which there form a close turf on the bottom of the lake. This floating island, when it rises above the water, is most elevated in the centre, and on its being pierced with a fishing-rod, water has spouted up to the height of two feet.

The marshy ground of the vale of Cashmere, and particularly around the city of Cashmere, containing many lakes, and liable to inundations, exhibits a peculiar form of human industry in its numerous FLOATING GARDENS, employed chiefly for the cultivation of cucumbers, melons, and water-melons. These floating gardens may be described as portions of the marshy ground artificially made to float, by cutting through the roots of the reeds, sedges, and other plants about two feet below the surface, upon which mud is then spread. The floating of the garden secures the soil and crop from destruction by inundations.

Floating gardens existed on the Lake of Mexico before the conquest of Mexico by the Spaniards. The Mexicans had made great progress in the art of gardening, and particularly in the cultivation of flowers, which were much used both in their festivities and in their worship. How they were induced to attempt the formation of floating gardens, and at what period it was first done, are mere matters of conjecture. The shallowness of great part of the lake was favourable to the success of the attempt, and perhaps the gradual receding of its waters may be reckoned among the reasons of the gradual diminution of the number of the floating gardens, which have almost ceased to be reckoned among the wonders of the world. The Abbé Clavigero, in his *History of Mexico*, describes them as formed of wicker-work, water-plants, and mud; as sometimes more than 20 poles in extent; the largest

ener commonly having a small tree in the centre, and sometimes a hut for the cultivator; and as employed for the cultivation both of flowers and culinary plants. Humboldt confirms this description, but states that the real floating gardens, or *chinampas*, are rapidly diminishing in number. The existing *chinampas* are in general not floating gardens, but plots of ground with very wide ditches between them, formed by heaping up earth from the ditches in the swamps or shallows at the side of the lake.

Great part of Bangkok, the capital of Siam, consists of floating houses. See BANGKOK.

FLOA'TSTONE, a variety of quartz, consisting of fibres—delicate crystals—aggregated so that the whole mass is sponge-like, and so light, owing to the air confined in the interstices, as to float for a while on water. It is found in a limestone of the chalk formation near Paris, in imbedded masses, or incrusting flint nodules.

FLOBE'CQ, a small town of Belgium, in the province of Hainault, 20 miles north-east of Tournai. It has extensive manufactures of linens, has breweries, salt-works, oil and flour mills, and has two fairs annually. Pop. 5258.

FLO'DDEN, BATTLE OF. On the 24th January 1502, a 'perpetual peace' was concluded between England and Scotland. In the course of a few years, however, a series of petty quarrels had done much to bring this peaceable arrangement to a termination; and in 1513, on the invasion of France, Scotland's ancient ally, by Henry of England, a war broke out between the two countries. James IV., the chivalrous but rash king of Scotland, summoned the whole array of his kingdom to meet on the Borough or Common Moor of Edinburgh, which extended from the southern walls of the city to the foot of the Braid Hills, and which was then 'a field spacious, and delightful by the shade of many stately and aged oaks.' Here an army, it is said, of 100,000 men assembled. With this force James crossed the border on the 22d August 1513; but instead of advancing at once, and achieving a decisive success, he lingered in the neighbourhood of the Tweed until his army had become reduced by desertion to about 30,000 men. On the 6th September, James took up his position on Flodden Hill, the last and lowest eminence of the Cheviots toward the north-east. On the morning of the 9th, the Earl of Surrey, lieutenant-general of the northern counties of England, at the head of an army of about 32,000 men, advanced from the south-east, crossed the Till by a skilful and unexpected movement, and thus cut off all communication between King James and Scotland. While the English were crossing the Till, the Scots might have attacked them with every chance of success, and their not taking advantage of this opportunity was the first great mistake of the battle. Observing that the English were aiming at a strong position to the north-west of Flodden Hill, and desirous of preventing this, James, having ordered his tents to be set on fire, advanced against them in battle-array. The two armies were drawn up in similar order, each consisting of a centre, a right and left wing, and a reserve placed behind the centre. At about four o'clock on Friday, 9th September, the battle commenced with cannonading on both sides. The Earls of Huntly and Home, who commanded the left wing of the Scottish army, charged the English right, which was led by Sir Edmund Howard, and entirely defeated it. Instead, however, of following up their success, Home's borderers commenced pillaging the baggage of both armies; and Huntly, after his first charge, is said to have left the field. On the Scottish right, the clansmen under Lennox and Argyle, goaded to fury by the English archers, rushed forward, heedless of order, and fell with the greatest violence upon their opponents, who, however, received them with wonderful intrepidity and coolness, and at length put them to flight with great slaughter. Meantime, a desperate resistance was being made by the Scottish centre, where the king fought on foot among his nobles. Scottish history presents no instance in which the national valour burned with a purer flame than in this. Hemmed in by outnumbering enemies, the king among his slender group of lords fought manfully until, when the night was closing on Flodden, he fell pierced by an arrow, and mortally wounded in the head. The hill was held during the night by the Scots; but at dawn, learning the state of matters, they abandoned their position. Their loss amounted to from 8000 to 10,000 men. 'Scarce a Scottish family of eminence,' says Scott, 'but had an ancestor killed at Flodden.' Besides the king, the Archbishop of St Andrews and twelve earls were among the slain. The English loss amounted to about 6000 or 7000; but Surrey's victory was so nearly a defeat that he was unable to prosecute the war with any vigour. The sixth canto of Sir Walter Scott's poem of *Marmion* contains a magnificent, and in the main an accurate, description of the battle.

FLOGGING, ARMY AND NAVY. Corporal punishment has existed from time immemorial in the British army and navy; formerly having been inflicted upon slight occasion, and often with barbarous severity. In deference, however, to public opinion, it has been much less resorted to during recent years, and promises almost to disappear under a regulation of 1860. A man must now be convicted of one disgraceful offence against discipline before he can be liable to flogging for the next such offence; and even after one such degradation, he may be restored to the non-liable class by a year's good conduct. The punishment of flogging, which is generally administered with a whip or 'cat' of nine tails on the bare back, cannot, under existing rules, exceed fifty lashes.

Corporal punishment is not recognised in the French army; but then the soldiers in that country are drawn by conscription from all ranks of society, and have, on an average, a higher moral tone than the British recruits, who, attracted by a bounty, volunteer usually from the lowest orders. On the other hand, the discipline in the French army, and especially during war on a foreign soil, is universally admitted to be inferior to the strict rule preserved among British troops. Soldiers and sailors being men unaccustomed to control their passions, and any breach of insubordination being fatal to the *esprit* of a force, unless summarily repressed, it is considered necessary to retain the power—however rarely exercised—of inflicting the painful and humiliating punishment of flogging. The French soldier, though escaping the ignominy of personal chastisement, is governed by a code harsher than our articles of war as actually administered; and the punishment of death, scarcely known in the British service during peace, is not unfrequently visited in France upon offenders against discipline.

FLOOR-CLOTH, a coarse canvas coated on both sides, and partly saturated with thick oil-paint, one side having usually a coloured pattern printed upon it in oil-paint. The canvas basis for floor-cloth is chiefly manufactured in Dundee. As it is required to be without seam, and of sufficient width to cover considerable spaces of flooring, special looms are required for weaving it. It is made

to 24 feet in width, and in lengths from 100 ards.

irst step towards converting this canvas r-cloth consists in stretching it on a frame. s work of some difficulty, on account of the e of the pieces. Some of the frames are as 100 feet in length by 24 feet in height, canvas must be stretched over it as tight as

The back or plain side of the cloth is rated upon, by *priming* it with a solution and scouring it with pumice. The object is to prevent too much of the paint from ing the canvas, and rendering it brittle, and an even surface to receive the paint, which l with linseed oil, with very little or no ne, and is consequently thicker than comnt. This is thrown or splashed upon the with a brush; and then with a long steel he workman spreads the dabs of paint, and a tolerably smooth surface. This *trowel*s left for 12 or 14 days to dry, and then coat is laid on in a similar manner; and this e back or under side of the floor-cloth.

the first coat of the back is drying, the *primed* and pumiced, and a coat of trowelid on. As more care is required on this coat of colour is scoured quite smooth with and two more trowel-colours are added, and ured like the first. Another coat is now laid on with a brush, and is called a *brush*. This forms the ground upon which the s to be printed.

printing is done by means of wood-blocks. ttern is first drawn and painted, in its form and colours, upon a piece of paper; piece of paper is now laid under this, and ines of that portion of the pattern included colour are pricked through to the lower In like manner, pricked outlines of each ther colours are prepared. Each of these sheets is laid upon a block of pear-tree d dusted over with powdered charcoal or k, and thus the pattern is drawn in dots e wood; the carver cuts away the wood ling the pattern, and leaves it standing in

ear-tree blocks are backed by gluing them e of deal, and this piece again to another, fibres at right angles, to prevent warping.

olours are spread by boys upon padded covered with floor-cloth, and each printer block upon that containing the required and then places it upon the floor-cloth, king it with the handle of a short heavy prints his portion of the pattern. He oceeds with a repetition of this, and as he , he is followed in order by the printers ther colours, who place their blocks accurer the pattern the first has commenced. t printer's chief care is to keep the repetithe pattern accurately in line.

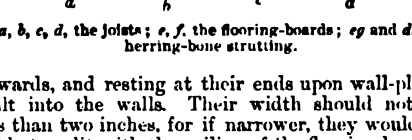
uality of floor-cloth depends mainly upon ber of coats of paint, the kind of medium the colour, and the time given to drying. best qualities, a fortnight must elapse be- laying on of each coat, and finally, several exposure in the drying-room is necessary. rental of the space thus occupied, and the of the capital left stagnant during this time, to a considerable sum, there is a strong nt to manufacturers to hasten the prohich may easily be done by using gold size linseed oil, or other rapid 'dryers,' instead linseed oil; but just in proportion as the s hastened by these means, the durability bility of the floor-cloth are deteriorated. In order to secure the maximum of durability, floor-cloth should still be kept three or four years after it has left the drying-room of the manufacturer, and purchasers should always select those pieces which they have reason to believe have been the longest in stock. Narrow floor-cloth, for stair-carpeting, passages, &c., is made as above, and then cut into the required widths, and printed. It usually has a large pattern in the middle, and a border of a smaller design.

The laying of lobbies and passages with encaustic tiles has lately led to the superseding of floor-cloth in such situations, while for some other purposes, such as covering the floors of churches, reading-rooms, and waiting-rooms at railway-stations, it is superseded by the newly invented material called kamptulicon, or vulcanised India-rubber cloth, which is impervious to wet, soft and quiet to the tread, and warm to the feet. This new material is made plain or figured to resemble painted floor-cloth.

FLOORS, FLOORING, the horizontal partitions between the stories of a building, the upper part of which forms the floor of the apartments above, and the lower portion the ceiling of those below.

Floors are variously constructed, according to their dimensions, and to the weight they have to sustain. *Single-joisted floors* are the simplest and most cheaply constructed, and are used for ordinary buildings, where the distance between the bearings does not exceed 20, or at most 24 feet.

The annexed figure represents a section of a single-joisted floor, in the line of the flooring-boards, and across the joists. These joists are beams laid edge



a, *b*, *c*, *d*, the joists; *e*, *f*, the flooring-boards; *eg* and *dh*, herring-bone strutting.

upwards, and resting at their ends upon wall-plates built into the walls. Their width should not be less than two inches, for if narrower, they would be liable to split with the nailing of the flooring-boards. They are placed edge upwards, in order to economise timber, as the strength of a beam to bear a transverse strain varies simply with the breadth and with the square of the depth. See STRENGTH OF MATERIALS. When a deep and long joist is used, there is danger of its twisting or turning over; this is prevented by *strutting*, that is, nailing cross pieces of wood between them, as shewn between the joists *c* and *d* of the figure, or less effectually, by driving pieces of planking between them. Strutting is required when the length of the joists exceeds eight feet. The laths for the ceiling of the room below are nailed to the bottom of the joists. In good substantial work, the distance between the joists from centre to centre is about 12 inches, but this is often exceeded in cheaply built houses.

Double-joisted floors are constructed by laying strong timbers, called *binding-joists*, from wall to wall, at a distance of about six feet apart; and a double set of joists, one above for the floor, and one below for the ceiling, are laid across these, and notched down upon them. These latter, when thus placed, are called *bridging-joists*, as they bridge over the interval between the larger binding-joists. This is adopted when a more perfect ceiling, free from cracks, produced by the yielding of the floor, is required, or where there is a difficulty in obtaining a sufficient amount of long timber for single joisting the whole of the floor.

The framed floor is one degree more complex

than the double-joisted. Binding and bridging joists are used in the framed floor, but the binding-joists cease to be the primary support, as for this purpose strong balks of timbers, called *girders*, are used. They are laid across, at distances of from eight to ten feet, and the binding-joists are framed into them by a *tusk-tenon* joint. See CARPENTRY. The bridging-joists are notched to these in the same manner as for double-joisted floors. A *bay* is the general name for the space between girders: if between a girder and wall, it is called a *tail bay;* or between two girders, a *case bay;* and the work between is described as a *bay of joisting.*

When the space to be spanned is too great for a simple wood-girder, trussed or built up wooden girders or iron girders are used: the latter have of late come into extensive use, even where simple wood-girders are applicable. See GIRDER.

With a given quantity of timber, and a moderate space, the single-joisted floor is the strongest of any. One of its disadvantages is the free communication of sound to the apartment below, unless some additional means of obstructing the sound be adopted.

When first laid, the floor should be rather high in the centre, to allow for settling at the joints; and when settled, it should be perfectly level, for if it rises in the middle, it will exert an outward thrust upon the walls, and if hollow, it will pull inwards; but if level, its whole strain is perpendicular.

The flooring-boards are usually nailed to the joists, and vary from 1 to 1¼ inch in thickness; for common floors they are from 7 to 9 inches wide, but for better floors a width of only 3 to 5 inches is used. The advantage of the narrow boards is, that the shrinkage and warping have not so much effect on the spaces between. This refers to the ordinary deal-flooring used in modern British domestic buildings. The facing of the floor in many old mansions is formed of small pieces of oak carefully inlaid. See PARQUETERIE. For other kinds of inlaid fancy floors, see MOSAIC, ENCAUSTIC TILES, and CONCRETE. In France, and most of the southern continental countries, where carpets are rarely used, the flooring-boards of the better class of houses are made of hard wood, carefully and closely jointed, and these floors are commonly rubbed with bees-wax, and polished. In humbler dwellings, even the bedrooms are paved with tiles, or strong plaster, or concrete; and considering the prevalence of fleas, &c., in such places, they are certainly better adapted for them than our deal-boards and carpets. They may be freely sprinkled, and even swilled with water in hot weather.

For warehouses where heavy goods are stored, for ball-rooms, &c., special construction is required to adapt the floor to the strain put upon it.

FLO'RA, among the Romans, was the name of the goddess of flowers and of the spring, and was latterly identified with the Greek *Chloris.* Her temple was situated in the vicinity of the *Circus Maximus.* The worship of F. was one of the oldest manifestations of the Roman religious feeling, and is affirmed to have been introduced by Numa. The *Floralia*, or festivals in honour of the goddess, were first instituted 238 B. C., and were celebrated from the 28th of April to the 1st of May, with much licentious merriment, prostitutes playing an important part on such occasions. On coins, F. is represented with a crown of flowers.—In Botany, the term Flora is a collective name for plants, and is used with regard to the vegetable kingdom in the same way as the term *Fauna* with regard to the animal. It is common to speak of the Flora of a country or district; and a work devoted to the botany of a country or district is often entitled a Flora of that region.

FLO'RENCE (Ital. formerly *Fiorenza*, now FIRENZE), the capital of Tuscany, is situated in the valley of the Arno, in lat. 43° 46′ N., and long 11 15′ E. It is about 123 feet above the level of the sea; 60 miles from Leghorn, 45 from Lucca, 40 from Siena, and 44 from Arezzo. Pop. 114,500. The Arno, spanned by four fine bridges, divides the city into two unequal parts, the chief of which stands on the northern bank of the river. In shape, an irregular pentagon, F. is enclosed by walls of about 6 miles in extent, and communicates with the exterior by means of eight gates, which conduct to thickly peopled suburbs, and a lovely, fertile, and salubrious neighbourhood, encircled by sloping hills, and studded with picturesque villas and fruitful vineyards and gardens. F. and her environs, viewed from the heights of Fiesole, appear but one vast city. Many causes render this city a most attractive place of residence to foreigners—a lovely country and healthful climate, cheap living, and the universal courteous intelligence of the people, united to the immense sources of interest possessed by the city in her grand historical monuments and collections of art. The massive and austere forms of Florentine architecture impart an air of gloomy grandeur to the streets, for the most part regular and well kept; but in the many feuds and civil convulsions of the city, these domestic fortresses were subjected to severe regular sieges and attacks, which lighter and more elegant structures could have ill withstood. The chief monuments of the city are Il Duomo, or the Cathedral, the foundations of which were laid with great solemnity in 1298. The Florentines having ambitiously resolved on erecting a monument which for architectural splendour and proportions should outvie all preceding structures, the honour of preparing the design was intrusted to Arnolfo de Cambio da Colle. On his death, Giotto superintended the works; and many eminent architects were employed before this splendid edifice was completed—Brunelleschi, the last, conceived and erected the grand cupola, so much admired by Michael Angelo as to have served him as model for that of St Peter's. At the side of the cathedral springs up the light and elegant bell-tower, detached, according to the custom of the times. In front is the Baptistery of San Giovanni, in form an octagon, supporting a cupola and lantern; all three edifices being entirely coated with a varied mosaic of black and white marble. Three bronze gates in basso-rilievo are a great additional adornment of the Baptistery; the two by Ghiberti have been immortalised by Michael Angelo with the name of Gates of Paradise. See Sgrilli's description. The church of the Santa Croce, the Pantheon of F. (built in 1294—architect, Arnolfo), contains monuments to Galileo, Dante, Machiavelli, Michael Angelo, Alfieri, &c. The church of San Lorenzo was consecrated as early as 393 by St Ambrose, and rebuilt by Brunelleschi in 1425, by command of Giovanni and Cosmo de' Medici. It contains an interesting monumental memorial of Cosmo il Vecchio, bearing inscribed the title *Pater Patriæ*, which had been conferred on his memory by public suffrage the year following his death. In the *Nuova Sagrestia*, or New Sacristry, are the two famous monuments of Michael Angelo to Julian and Lorenzo de' Medici. The figures of these two statues are marvels of deep and living expression, and unsurpassable in their mute and eloquent beauty. The Medicean chapel, gorgeous with the rarest marbles and most costly stones, agate, lapis lazuli, chalcedony, &c., stands behind the choir, and contains the

History of Florence.—The city of F. sprang originally from Fiesole (q. v.), at the foot of which it lies extended. The inconvenient and hilly site of the Etruscan Fiesole, perched on the crest of an irregular height, rendered the town so difficult of access to the traders who resorted to its market-places with their varied merchandise, that it was at length decreed they should assemble at the base of the hill, in the fertile plain traversed by the Arno. The few rough shelters erected for the accommodation of these traders may be considered the original nucleus of the important and splendid city of Florence. Such at least is the traditionary history of its origin generally accepted by the Florentine historians. It would seem that as early as the time of Sulla there had been a Roman colony here; another was sent after the death of Julius Cæsar, and it soon became a thriving town. The *Florentini* are mentioned by Tacitus, 16 A. D., as sending delegates to Rome, but it was not till the time of Charlemagne that F. began to rise out of obscurity. It was now governed by a political head with the title of Duke, assisted by various subordinate officers, who were elected by the united suffrages of the duke and citizens. In the 11th c., F., and a great part of Tuscany, were bequeathed to Pope Gregory VII., by his friend and partisan the Countess Matilda, who inherited from her mother, the Countess Beatrix, her jurisdiction over the city. Under the protection of Rome, F. speedily adopted the forms and institutions of a free city; and the republican spirit which then arose amongst the people imparted an impulse to national and individual life, and awoke a spirit of ardent patriotism and splendid enterprise. As early as the 11th c., the Florentines were European traders, and the possessors of grand commercial dépôts in the seaports and cities of France and England, and their skill as workers in gold and jewels had grown proverbial. In proportion as papal preponderance increased in F., that of the empire sank; and in 1113 the citizen forces routed the troops, and slew the delegate of the emperor at Monte Cascioli, near Florence. During the bitter wars between pope and empire, F. and all Tuscany seemed to have been saved from the civil feuds which raged throughout Italy between the contending factions of Guelphs and Ghibellines; the former, adherents of the pope; the latter, of the empire. But in 1215, F. became involved in the great party struggle, owing to a private feud breaking out between two noble families, chiefs of the contending principles. A Guelph noble, Buondelmonti, mortally incensed the Ghibelline family of the Amidei, by breaking off his alliance with a daughter of their house, and contracting marriage with a member of a Guelph family. To avenge this insult, the Amidei appealed to their powerful kinsmen, the Uberti, and, in fact, to all the Ghibelline party of Florence. Buondelmonti was stabbed to death as he crossed the bridge of the Ponte Vecchio, and was speedily avenged by the Guelphs in the blood of his enemies. Thus for 33 years was F. distracted by the deeds of bloodshed and violence of these two rival factions, who assumed the names, and adopted the respective causes of Guelph and Ghibelline. See GUELPH AND GHIBELLINE. In 1250, the animosity of these parties seemed somewhat blunted, and public attention was directed to wise internal reforms. Twelve magistrates, or anziani, were appointed in place of the consuls, each of the six sections into which the city was divided being intrusted to two of these magistrates, whose tenure of office was annual. To avoid all local dissensions, two other magistrates, strangers by birth, were elected: the one, invested with supreme authority in civil and criminal cases, was called the podestà; the other, with the title of captain of the people, had the chief

command of the militia, in which were enrolled all the youth of the state, who were bound, at the call of this magistrate, to join their company fully equipped for fight: 20 companies defended the town, 96 the country. After the death of the Emperor Frederick II., the great protector of the Ghibellines, the Guelph or papal party gradually rose in power in F., and during ten years of their predominance, the city ascended in grandeur and prosperity, until it stood not only the first in Tuscany, but one of the first of all Italy. In 1254, the Florentines first coined their noble golden florin, unequalled at the time for beauty: in weight, a drachm, it bore on one side the national emblem, a lily; and on the reverse, the effigy of the popular patron, St John the Baptist. It commemorated a period of great success in the annals of F., whose forces had successively humbled the adjoining towns of Siena, Arezzo, Pisa, and Pistoja in 1252, and in 1254 captured Volterra. In 1260, the standard of civil war was again raised by the Ghibellines of F., who, in league with Manfred of Naples, attacked the Guelphs, and cut their forces to pieces in the sanguinary battle of Monte Aperto. The conquerors entered F. forthwith in the name of Manfred, abolished all trace of the popular institutions, establishing an exclusively aristocratic executive, and even strongly advocated the entire destruction of the city, the hotbed of Guelphism. This barbarous scheme was indignantly repudiated by their own famous leader, Farinata degli Uberti, immortalised by Dante for his patriotism. He declared his intention of heading the Guelphs, were such a sacrilege perpetrated by his own party. Pope Urban IV., French by birth, summoned against the Ghibelline Manfred a French army, led by Charles of Valois, to whom he offered the prospective kingdom of the Two Sicilies. Manfred was defeated and slain in the famous battle of Benevento, and Guelph ascendency was restored anew throughout Italy and Florence. Charles fully restored to the Florentines their internal institutions, and received their offered allegiance for ten years, 1266. In 1282, the *Priori*, a new executive power, was established in F.; and in 1293, by the consent of the Priori, a higher chief than their own order was elected, with the title of *Gonfaloniere*. In 1300, Dante became one of the Priori, and the former feud was recommenced with new vigour between two factions, who bore the names of Bianchi (Whites) and Neri (Blacks). Their dissensions were, however, interrupted by the appearance of Charles of Valois, sent by Boniface VIII. to restore tranquillity, 1301. Charles espoused the part of the Guelphs or Neri, and sanctioned every outrage on the Bianchi, who were plundered and murdered barbarously, the survivors being exiled and beggared; among these were Dante, and Petracco dell' Ancisa, the father of Petrarca. In 1306, Pistoja was besieged, and taken by famine with great barbarity. In 1315, the Florentines met with a severe check from the Ghibellines of Pisa, under the command of Uguccione della Faggiula; and in 1325, were completely defeated by Uguccione's successor in command, the valiant Castruccio Castracani, in the battle of Altopascio. F., weakened by long dissensions, and alarmed by Castruccio's threat of marching on the city, appealed to the king of Naples for aid. They received joyfully an officer of the king, entitled the Duke of Athens, sent as royal vicar; and such was the public demoralisation of the moment, they proclaimed him dictator of the republic, unanimously suppressing the offices of priori and gonfaloniere. The intrigues of this ignoble schemer to overturn the republic being discovered, he was ignominiously expelled by a general popular rising, and narrowly preserved his life. An attempt to admit a proportion of the nobles into the government signally failed at this time, and only led to renewed animosity between them and the citizens. This was the last effort of the nobles to secure power. See Machiavelli, book ii. A terrible pest decimated F. in 1348, sweeping off 100,000 of her inhabitants. See Boccaccio, *Decameron*. The chief power of F. about this time seems to have been alternately wielded by the democratic families, the Alberti and the Ricci, and by their patrician rivals, the Albizzi, who, for the space of 53 years, guided the republic in the path of independence and progress. In 1406, the ancient and illustrious republic of Pisa (q. v.) fell under the sway of F., after a most heroic resistance. From 1434, the history of F. is intimately bound up with the House of Medici, whose influence supplanted that of the Albizzi. See MEDICI. The Medici were repeatedly banished from F., in consequence of their aiming at sovereign power; and to their intrigues F. owes her final loss of republican rights and institutions. Pope Clement VII., of the House of Medici, formed a league with the Emperor Charles V., by which the liberties of F. were to be extinguished, and the sovereign power to be invested in the pope's bastard son, Alexander de' Medici. In September 1529, an army of imperialists, under the Duke of Orange, entered Tuscany; and on the 8th of August 1530, the siege of F. terminated, after a defence of unexampled devotion and bravery on the part of the citizens. Thus fell the name and form of the republic of F., quenched in the best blood of the city, a sacrifice to a renegade pope, who employed both foreign robbers and internal traitors to destroy and humiliate the city of his birth. From this period, F. loses her distinctive history, and is only known as capital of the grand duchy of Tuscany, Pope Clement having conferred on Cosmo de' Medici the ducal dignity. Some idea of the splendour and prosperity of F. as a republic may be had from the fact, that her capitalists were so enormously wealthy, they supplied the chief sovereigns of Europe with funds; her manufactures of wool, silk, and gold brocade were exported throughout the world; and besides home centres of commerce, she possessed great commercial establishments in all the countries of Europe. This wonderful prosperity the Florentines owed solely to their indomitable spirit of enterprise, and to their industry, energy, and independence.—Compare the writings of Machiavelli, Guicciardini, Sismondi, Varchi, and Denina.

FLO'RÈS, as the name of various islands, occurs in Asia, North America, South America, and the Azores.—1. In the Malayan Archipelago, about half way between Java and the eastern extremity of the chain. It lies due south from Celebes, stretching in S. lat. from 8° to 9°, and in E. long. from 120° to 123°. Like most members of the group, it is of an oblong shape, measuring 200 miles in length by an average breadth of 35. In common with the rest of the cluster, the island is of hilly character and volcanic origin. It produces cotton, sandal-wood, and bees-wax; and its principal trade is with Singapore.—2. The most westerly of the Azores, with a population of about 10,000—lat. 39° 25' N., and long. 31° 12' W.—3. In the Pacific Ocean, a little to the west of Vancouver Island—lat. 49° 20' N., and long. 126° W.—4. In the Plata, about 20 miles below Monte Video, in the republic of Uruguay, in lat. 34° 56' S., and long. 55° 55' W.

FLO'RET. See FLOWER.

FLO'RICULTURE, or CULTIVATION OF FLOWERS. From the earliest times, and wherever any considerable progress has been made

ıation, plants have been cultivated for the
ıheir beautiful or fragrant flowers. Flowers
ıen very generally employed not only to
ratification, and for the adornment of the
ınd of houses, particularly on festive occa-
ıt in many countries also in connection with
rites. Flower-markets existed in ancient

ı department of horticulture have greater
been effected by cultivation. Even the
d eye has often some difficulty in recog-
he splendid varieties which the florist has
d, as the progeny of the unpromising
form. One of the most common effects of
ion is the production of double flowers, in
ıe stamens have been converted into petals,
as in roses, so that if the flower is perfectly double, it can produce no seed by itself; or, in the case of composite flowers, the florets of the disc assume the same form with the florets of the ray, as in dahlias, asters, &c. Much improvement has been effected by crossing, not so frequently by the real hybridisation of different species, as by the intermixture of artificial varieties already obtained; and many of the finest varieties are the mere result of the careful selection and cultivation of individual plants of superior beauty, and of their progeny.

The green-house, conservatory, stove, &c., in which exotic flowers are cultivated, are noticed in separate articles. But perhaps this article would not be complete without some notice of *window-gardening*, by which a charm is added even to the abodes of the wealthy, particularly in cities, and by which even the poor have the delight of tending a choice exotic or two, and becoming familiar with the beauty of their flowers. The care requisite in window-gardening is the same as for plants kept in flower-pots in the green-house; there must be the same re-potting, pruning of the roots, &c., from time to time, and at least as much attention in giving water and air. Of the former, the most common mistake is to give too much, and of the latter too little. It is a good rule, that except immediately after water is given, it should never be seen in the saucer; nor should the earth appear *very* moist. The situation, however, being in many respects less favourable, many plants, as heaths, which are frequent in green-houses, cannot be successfully cultivated in the windows of apartments. The common notion that the burning of gas in apartments injures window-plants, does not appear to be well founded. WARDIAN CASES, by means of which many delicate plants are produced in the greatest perfection in the windows of apartments, are noticed in a separate article.

Horticultural Societies (q. v.) have of late done much for the encouragement of the cultivation of flowers, and particularly among the humbler classes of society, with evident increase of amenity within and around their abodes, and an unquestionable tendency to refinement of habits and feelings.

FLO'RIDA, the name of the most southerly member of the United States, and the twenty-seventh in order of admission. Including its adjacent islands and its reef-like chain of keys on the south-west, it stretches in N. lat. between 25° and 31°, and in W. long. between 80° and 87° 44'. The greater portion of it forms a peninsula stretching south-south-east towards the Bahamas, having the Atlantic on the one side, and the Gulf of Mexico on the other. It adjoins, on the north, the states of Georgia and Alabama. Its greatest breadth, from the Atlantic to the river Perdido, is 360 miles; its greatest length about 400 miles; the average breadth of the peninsular portion upwards of 120 miles; area, 60,000 square miles. The principal rivers are the St John's, running north-east through the peninsula, and entering the sea near Jacksonville after a course of 300 miles; the Suwance, flowing south from Georgia into the Mexican Gulf at Vacassar Bay; the Appalachicola, the Choctawhatchee, Escambia, and Perdido. The principal towns are Tallahassee, the seat of government, situated near the middle of the northern boundary; St Mark's on the Gulf; St Augustine on the Atlantic, the Spanish capital, and the oldest settlement in Anglo-Saxon America; and Pensacola, a port near the Perdido, in the extreme west of the state, recently rendered so conspicuous in the war of secession.

In physical character, the state, generally speaking, is part of the sandy and marshy belt which

forms the immediate seaboard from the Potomac to the Mississippi. Nay, far beyond the average of the contiguous shores in either direction, it may, almost without a metaphor, be described as amphibious. To say nothing of inlets, which carry the tide within fifty miles of every point, the interior may literally be said to teem with fresh water, here and there welling up into considerable streams from springs ranging to 250 fathoms in depth. This is more emphatically true of the south, where an immense district, known as Everglades, exhibits, as its normal condition, the ordinary phenomena of a casual inundation. Though the surface is thus better adapted to pasturage than to tillage, yet, in favourable localities, the soil, rather through the abundance of heat and moisture than from any inherent fertility, largely yields such productions as sugar, cotton, and rice. Considering that the state shares with the Bahamas the dominion of that grand highway of commerce, the Gulf Stream (q. v.), its inexhaustible growth of timber for ship-building is peculiarly valuable. Its coasts and rivers swarm with shoals of fish; while its dependent keys, periodically crusted with salt of the sun's making, furnish the means of curing them.—*Florida*, so called because of its exuberant vegetation, was first made known to Europeans by Ponce de Leon, who landed near St Augustine in 1512. In 1539 it was explored by Fernando de Soto. Originally, the term F. vaguely indicated among the Spaniards the eastern side of the new continent to the north of Mexico, just as the term California received a similarly loose interpretation on the western coast. Gradually, however, it came to be circumscribed by the encroachments of rival powers—its first definite boundaries being established with reference to the claims of English Georgia and French Louisiana. Even within these limits, it embraced, in addition to the F. of the present day, the maritime borders of Alabama and Mississippi. Thus fixed in position and extent, the colony was ceded to England in 1763, and recovered by Spain in 1781. In 1803, however, Louisiana having been bought by the United States from France, F. became to the former country a commercial and political necessity; and accordingly, in 1821, it was annexed to the great republic by a mixture of force and negotiation.

The same physical character of F. which impairs its economical worth, has added materially to the expense of its occupation. From about 1836 to 1842, the Seminole Indians, protected by their swamps against every civilised appliance but the blood-hound, tasked the resources of the American Union more than any other domain of equal size ever tasked them. Notwithstanding every drawback, the country, possessing as it does, a comparatively salubrious climate, has made a reasonable progress in wealth and population. In 1850, 349,423 acres were under cultivation; and in 1855, the assessable capital was estimated at about 50,000,000 dollars—nearly 14,000,000 in lands, fully 27,000,000 in slaves, and more than 8,000,000 in other descriptions of property. It is only recently that railways have been introduced into Florida. A system of about 700 miles had been projected, and in 1859 there were 216 miles completed. According to the national census of 1850, the inhabitants numbered 87,401, of whom 39,309 were slaves; under local returns of 1855, the corresponding totals were 110,823 and 49,526. The national census of 1860 gave 78,686 free, and 61,753 slave; total, 140,439.

FLORIDA, Gulf of, the name given to the channel between Florida and the Bahamas, traversed by the Gulf Stream (q. v.). From Florida Reefs on the south, to Settlement Point, the most northern of the Bahamas in the channel, is 200 miles long; greatest breadth at the southern extremity, 150 miles; at the northern extremity, 65 miles.

FLORIDA BLANCA, Don Josefo Monino, Count of, prime minister under Charles III. of Spain, was born in 1728 at Murcia, where his father was a notary. Having studied at Salamanca, he gained soon after such distinction that he was appointed Spanish ambassador to Clement XIV. of Rome. In that office, he displayed great ability, especially in the abolition of the order of Jesuits and the election of Pius VI. Grimaldi, Spanish minister of Foreign Affairs, on being dismissed, was asked by the king to nominate a successor, and accordingly proposed Monino. Charles followed his advice, created Monino Count of Florida Blanca, and intrusted to him, besides, the department of matters of justice and mercy, as well as the superintendence of posts, highways, and public magazines. F. used this extensive authority in introducing post-coaches and good post-roads, in improving the capital, and attending to other important departments of general police, as likewise in actively promoting the arts and sciences. His effort to confirm the good understanding between Spain and Portugal by a double marriage, which would have secured the Portuguese throne to a Spanish prince, was unsuccessful. His military undertakings also, the attack upon Algiers in 1777, and the siege of Gibraltar in 1782, issued unfortunately. Before the king's death in October 1788, F. presented a defence of his administration, with a request for leave to resign. The defence was accepted, but the request refused. However, under Charles IV. in 1792, F.'s enemies obtained his disgrace. Imprisoned at first in the citadel of Pampeluna, he was afterwards released, and banished to his estates. He appeared again at the meeting of the Cortes in 1808, but died November 20 of the same year.

FLORIDEÆ. See Ceramiaceæ.

FLORIN was the name of a gold coin first struck in Florence (q. v.) in the 13th century. It was the size of a ducat, and had on one side a lily, and on the other the head of John the Baptist. Some derive the name from the city, and others from the flower. These coins were soon imitated all over Europe. It was out of them that the German gold guldens of the middle ages and the modern guldens arose. These last are still marked by the letters *Fl.* The gulden or florin is the unit of account in Austria and the south of Germany. Its value in Austria is 2*s.* English; in the other states, 1*s.* 8*d.* The name has been recently applied to the English two-shilling piece.

FLORI'NIANS, a Gnostic sect of the 2d c., so called from a Roman priest, Florinus, who, with his fellow-presbyter, Blastus, introduced doctrines resembling those of Valentinus, into Rome, in the pontificate of Eleutherius (176), and was excluded from communion by that pontiff. See Gnosticism, Valentinians.

FLO'RISTS' FLOWERS are those kinds of flowers which have been cultivated with peculiar care, and of which, consequently, there exist numerous varieties, differing very much in appearance from each other and from the original flower. Such are tulips, hyacinths, roses, auriculas, carnations, anemones, ranunculuses, dahlias, &c. The special cultivation of particular flowers was first prosecuted to a remarkable degree in Europe by the Dutch in the beginning of the 17th c., and from the Netherlands a passion for it extended to other countries, particularly to England and Scotland, when the religious persecutions drove many refugees to the British shores; and to this day it prevails most of

› the branches of manufacture introduced fugees are carried on. In the little gardens ives in some of the manufacturing towns een many of the finest tulips and carna- Britain. It is still, however, in Holland, icularly at Haarlem, that this branch of is carried on to the greatest extent, and it hat quarter that the market of the world supplied with bulbs, seeds, &c. Between and Leyden are more than twenty acres ted to hyacinths alone, which succeed best e sandy soil. The cultivation of roses at ll, in South Holland, is carried on in con- fields situated in the *dunes*, and affords o many families. Berlin has of late years he seat of a flower-trade, which partially at of Holland. Some flowers, as dahlias hocks, are produced in greatest perfection a cultivators. The Chinese have had their owers, camellias, hydrangeas, tree peonies, time immemorial.

years 1636 and 1637, an extraordinary ania prevailed in Holland, chiefly with to tulips, in which men speculated as recently seen them do in railway shares. re sold for enormous sums. For a single *ugustus* (a tulip), 13,000 florins were once for three such together, 30,000 florins. ership of a bulb was often divided into den sold bulbs, which they did not possess, ion of delivering them to the buyers within ed time; and of some varieties, far more re sold than actually existed. But these nces soon ceased, although not till they lved many persons in ruin.—It was not the year 1776 that the real flower-trade ld reached its greatest importance; from ne it has rather declined. New varieties of l hyacinths are sometimes marked in the catalogues at prices from 25 to 150 florins.

:US, generally, but on insufficient evidence, Annæus F., was a Roman historian who in the reign of Trajan or Hadrian. Of ve know absolutely nothing. He wrote ne of Roman history (*Epitome de Gestis um*), from the foundation of the city to of Augustus. This work, which is still carefully and intelligently composed, but ed by an inflated and metaphorical style. *editio princeps*—if, indeed, it be such— t the Sorbonne in 1471. F.'s epitome has lished times without number. The best dition is that of Dukerus (Lug. Bat. 1722, ip. 1832).

ANT (Fr.), used in Heraldry to express object is flying in the air, as a banner-

SAM. Wreck, in the legal acceptation of is goods which, having been scattered by ck, have floated to land. From goods in on of wreck are distinguished those known w of England by the uncouth expressions *etsam*, and *ligan*. The first is where the tinue floating on the surface of the waves; d is where, being cast into the sea, they remain under water; the third is where sunk in the sea, but are tied to a cork, or buoy, in order that they may be . If no owner appears to claim them, these various positions go to the crown, so a royal grant to a man of *wrecks*, things *etsam*, or *ligan* will not pass. See JET- JETTISON, an important term in the law- , from which jetsam must be carefully hed.

FLÖTZ (Ger. level), the name given by Werner to the secondary rocks of Lehmann, because, in the district in which he examined them, they were horizontal. He arranged the rocks which form the solid crust of the earth into four classes. 1. The primitive beds without organic remains, such as granite and gneiss; 2. The transition strata, which, from their more or less metamorphic condition, were related to the primitive rocks on the one side, and from their few contained organisms, to the flötz on the other; 3. The flötz containing all the sedimentary rocks, from the coal-measures up to and including the chalk; and 4. The newer strata, which he called the 'overflowed land' or alluvium. When the followers of Werner found that the horizontal position of the flötz was a local accident, they abandoned the term, and restored Lehmann's title of Secondary.

FLOUNDER (*Platessa*), a genus of fishes, of the Flatfish family (*Pleuronectidæ*), having one row of cutting teeth in each jaw, and generally pavement-like teeth on the pharynx; the dorsal and anal fins extending nearly the whole length of the body, the dorsal not coming further forward than the centre of the upper eye; the tail-fin distinctly separated both from the dorsal and the anal. To this genus belong the Plaice, Flounder, Dab, &c., of the British shores. The species generally known as the F. (*P. Flesus*), is very common, not only on the British shores, but on those of most parts of Europe. Its Swedish name is *Flundra*. Its Scottish name is *Fleuk* or *Fluke*, a name which, with additions, is extended to many other kinds of flat-fish. The F. is often a foot or more in length. Its greatest breadth, without the fins, is about one-third of the whole length, rather less than that of the plaice. It is easily distinguished from the plaice by a row of small tubercles on each side of the lateral line. The colour varies according to the ground from which the fish is taken. The F. is found chiefly in rather shallow water, with sandy or muddy bottom, and equally in the most perfectly salt water and in the brackish water of estuaries. It ascends still rivers into perfectly fresh water, and may be kept in fresh-water ponds. It lives long out of water, and is easily transferred to ponds.—The F., like the other fishes of this genus, generally swims on the left side, and has the eyes on the right side; but reversed specimens are of frequent occurrence.

FLOUR is a popular name given to the finer portions of meal or pulverised grain. Thus, *flour*, or *wheat-flour*, is the fine part of ground wheat; *pea-flour*, of pease, &c. See BREAD.

FLOUR, ST, a small town of France, in the department of Cantal, is finely situated on a steep basaltic plateau at an elevation of 3000 feet, 34 miles east-north-east of Aurillac. It is entirely built of lava and basalt. Its streets are narrow, and its houses in general have a miserable, dark, and dirty appearance. The principal building is the cathedral. A suburb lies at the foot of the rock, and communicates with the town by a winding road cut in the rock. F. has manufactures of hollow ironware, cloth, and table-linen. Pop. 5660.

FLOURENS, MARIE JEAN PIERRE, a celebrated living French physiologist, born in 1794 at Maureilhan, Hérault. After having obtained his degree of Doctor of Medicine at Montpellier, at the early age of 19, he proceeded to Paris, where he soon became acquainted with the Cuviers, Geoffroy St Hilaire, and other eminent naturalists. For the last forty years, F. has been a voluminous writer on human and comparative anatomy and physiology, on natural history, and on various special departments of the history of the natural and physical sciences

Among his most important works we may mention his *Recherches Expérimentales sur les Propriétés et les Fonctions du Système Nerveux dans les Animaux Vertèbres* (1824); with a supplementary volume, entitled *Expériences sur le Système Nerveux* (1825); *Recherches sur le Développement des Os et des Dents* (1842); *Anatomie Générale de la Peau et des Membranes Muqueuses* (1843)—a work tending to demonstrate the unity of the human race, by shewing that there are no essential differences between the structure of the skin in the negro and the European—and his *Théorie Expérimentale de la Formation des Os* (1847), perhaps the most celebrated of his works. Among his smaller and popular works, are his *Analyse Raisonnée des Travaux de Georges Cuvier* (1841); *Buffon, Histoire de ses Idées et de ses Travaux* (1844); *De l'Instinct et de l'Intelligence des Animaux* (1841); *Examen de la Phrénologie* (1842); *Histoire de la Découverte de la Circulation du Sang* (1854); *De la Longévité Humaine, et de la Quantité de Vie sur le Globe* (1854); and his *Eloges Historiques*—a beautifully written series of scientific biographies.

As early as 1821, F. delivered a course of lectures on 'The Physiological Theory of Sensations,' and presented some of his first scientific contributions to the Academy of Sciences, into which body he was admitted as a member in 1828. About this date, he was appointed assistant to Cuvier; and in 1832, he succeeded to the full duties of the professorship of natural history in the Jardin du Roi. In 1833, he succeeded Dulong as Perpetual Secretary of the Academy of Sciences—an office which he still continues to discharge; and in 1840, the French Academy elected him a member. He was made a peer of France by Louis Philippe in 1846, and was appointed professor in the Collége de France in 1855. He is unquestionably the most popular French scientific writer of the present day.

FLOWER, or **BLOSSOM**, that part of a phanerogamous plant in which the organs of reproduction (*stamens* and *pistils*) are situated, and which consists essentially of a single group of these, generally surrounded by *floral envelopes* (the *calyx* and *corolla*). Both the organs of reproduction and the floral envelopes are metamorphosed leaves, and arise in successive whorls from a much shortened axis, called the *thalamus* (Gr. a nuptial-bed), or *torus* (Lat. a couch). Flowers are sometimes closely attached to the stem or branch from which they grow, and are then said to be *sessile* (Lat. sitting); but sometimes there intervenes a *flower-stalk* or *peduncle*, either simple or branched. The whole assemblage of flowers of a plant is called its *Inflorescence* (q. v.), and the different kinds of inflorescence, or modes in which the flowers are produced and grouped, are often as characteristic as the diversities in the flowers themselves, although the latter are in general more important with reference to botanical affinities.

In the very large natural order *Compositæ*, many small flowers are congregated on a common *receptacle*, and surrounded with *bracts* in the form of an *involucre*, as a single flower is surrounded by its calyx. The *head of flowers* is in this case popularly called a flower; and the individual flowers of which it is composed are by botanists styled *florets*. This term is also applied to the individual flowers in the *spikelets* of the Grasses (q. v.), of which the *glumes* are a common involucre.

The order of the whorls in flowers is invariable; the Calyx (q. v.) is always exterior to the Corolla (q. v.); within the corolla are the *Stamens* (q. v.), or male organs of reproduction, and in the centre of all is the *Pistil* (q. v.), the female organ of reproduction. An outer calyx, or whorl of metamorphosed leaves, exterior to the calyx, and usuall is found in some flowers, as mallows, an the *epicalyx*. Within the corolla, there times an additional or supplementary cor the *Corona* (q. v.), *coronet*, or *crown*.

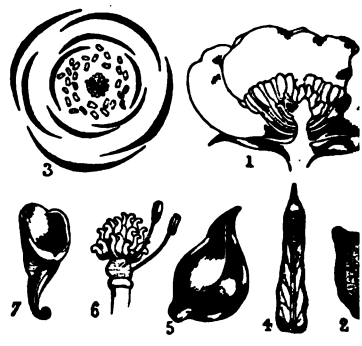

Illustration of some of the Principal Parts of (from Balfour's *Botany*):

...he greater number of plants, flowering takes ...during the flowering season, indiscriminately, ... hours of the day; and the flowers once opened, remain open, even during night, till they fade. In many plants, however, a *sleep of flowers* takes place; they open and close with the returns of day and night. Thus, *sunflowers* open in the morning, and close at evening; whilst there are other flowers which open in the evening, and close in the morning. Others also open and close at certain hours of the day; thus the flowers of the common purslane open about 11 o'clock A.M., and close soon after midday; *Anthericum pomeridianum* opens its flowers about 2 P.M., and closes them before night; the large fragrant blossoms of *Cereus grandiflorus* open between 7 and 8 P.M., and its sleep commences soon after midnight. In a few plants, the sleeping and waking of the flowers are regulated by the conditions of the weather. The waking and sleeping of flowers either continues for several days in succession, as in some species of *Mesembryanthemum;* or the brief life of the flower ends when it first sleeps, as in the Tiger-flower.

The odours of flowers, extremely various, often delightful, and sometimes very offensive, are in some cases equally powerful as long as the flower is open; in others, they vary in strength at different times of the day. Some flowers, as those of *Hesperis tristis* and *Pelargonium triste*, although remaining open during the day, diffuse their fragrance only when night comes on. The Oriental Hyacinth, so commonly cultivated in windows, is at all times perceptibly fragrant, but fills the atmosphere of the apartment with its perfume about eleven o'clock at night.

The colours of the different parts of flowers, the variety and beauty of which render many of them so attractive, generally remain unchanged, but sometimes undergo changes during the life of the flower. The flowers of *Myosotis versicolor*—a small species of Forget-me-not, very common as a weed in gardens—are sulphur-yellow when they first open, and afterwards change to blue. The petals of *Cheiranthus mutabilis*, when they first expand, are yellow, and afterwards pass to orange, red, and finally purple. In *Hydrangea hortensis*, familiar as a window-plant, the flowers are at first green, then rose-colour, purplish red intermixed with green, and finally, when about to fade, they are of a sickly green. Some flowers undergo remarkable changes of colour during the day, as those of the common pink *Phlox*, which, early in the morning, are light blue, and become bright pink as the day advances; and those of *Hibiscus variabilis*, which are white in the morning, pink at noon, and bright red at sunset.

The colours and odours of flowers are subjects in the investigation of which physiologists have not yet been able to go far. The chemical products on which they immediately depend are partially known; but how the chemical changes are wrought, and what various purposes they all serve as to the plant itself, can scarcely be said to have even begun to be ascertained. Both colours and odours are more or less owing to the action of the sun's rays. They are also sometimes modified by soil; and diversities of colour have been obtained in cultivated flowers by changing the soil in which they grow.

A few flowers are edible, although none are of any importance on this account. Some, or parts of them, are used in dyeing; but notwithstanding the beauty and variety of the colours of flowers, a very small proportion of vegetable dye-stuffs is obtained from them; and a similar remark is applicable to their medicinal use. For dyeing and painting, the colours of flowers can seldom be obtained in considerable quantity, except at too great expense, and seldom of brilliancy at all corresponding with that which they exhibit in the flower itself. They are also in general

fixed with great difficulty, some yellow colours being the only notable exceptions.

Flowers being subservient to the reproduction of the species, are, in all not unfavourable circumstances, followed by Fruit (q. v.). This, of course, in monœcious and dicœcious plants, is the case only with the female flowers, the male flowers soon withering away when they have dispersed their pollen. See FECUNDATION and STAMEN. But even after the fecundation of the germen, and when, in the language of gardeners, the fruit is *set*, unfavourable circumstances, such as excessive heat or cold, drought or moisture, want of due nutriment to the plant, or through excessive number of fruits set at once, to the individual fruit itself—often cause it to fall off early, long before it has attained its full size. See FRUIT.

FLOWER-DE-LUCE. See IRIS.

FLOWER-POTS are generally made of burnt clay, unglazed, tapering a little towards the bottom, and having the bottom perforated with one or more holes. Those of smallest size (*thumb-pots*) are only about two inches deep, and are used chiefly for seedlings to be soon again transplanted. For plants which require a pot of more than 12 inches deep and 18 inches wide, wooden boxes or tubs are generally provided. The flower-pot is usually placed in a saucer of the same material, when used in apartments or on the shelves of a green-house; but when plants growing in flower-pots are placed in the garden, the saucer is dispensed with. For ornamental use, flower-pots are sometimes glazed, or made in the shape of vases, &c.—In filling flower-pots, small stones or bits of broken pottery are placed in the bottom, to prevent water from lodging there, and *souring* the soil in which the plant is to grow. The roots of plants growing in pots are generally examined once or twice a year, by turning them out of the pot with the whole ball of earth attached, when the roots, which have often become matted round the outside of the ball of earth, are pruned, and the plant is either restored to the same pot or transferred to a larger one. The change of soil made at this time is, according to circumstances, either complete or partial.

FLOWERS, ARTIFICIAL. This elegant branch of manufacture, though not usually ranked among the fine arts, may be fairly regarded as holding an intermediate place between them and the mechanical arts. The Italians were the first to bring it to a high state of perfection, and it is now successfully carried out both in England and France. The value of artificial flowers annually exported from France exceeds £40,000.

The materials used are very various. Feathers have long been used by the South American Indians. In Italy, the cocoons of silk-worms are dyed, and extensively used. Beautiful imitations of flowers are made from shells, either in their natural colours or tinted. Paper, ribbons, velvet, thin laminæ of whalebone, &c., are also used. The materials of which the artificial flowers commonly in use are made are French cambric, Scotch cambric, jaconet, and fine calico, besides muslin, crape, and gauze for particular flowers, and satin and velvet for thick petals, &c. Wax-flower-making is quite a distinct branch, and those who follow it claim with justice the title of artist. It will be treated under the head of WAX-FLOWERS.

The petals and sepals of the flowers, as well as the leaves of the plant, are stamped out by punches, or 'irons,' as they are technically termed. A large stock of these irons is necessary, as special forms and sizes are required for each flower. The next process in shaping is that of 'goffering,' or 'gauffering,' by means of which the hollow form is given to petals, and the midrib and veins of leaves imitated. For hollowing petals, the goffering-iron is simply a polished iron ball mounted on an iron wire in a handle. It is slightly warmed, and the petal is placed on a cushion, and the iron pressed against it. A variety of other forms of goffering-irons are used, such as prismatic rods, bent wires, &c. The venation of leaves is effected by dies made of iron or copper, which are nevertheless called goffering-irons.

The tinting of petals of the best flowers requires some amount of delicacy and skill. In nature, however, the tint of each petal of a flower is rarely uniform; and the best artificial flowers represent the natural variations with great accuracy. The petals of a rose, for example, are dyed by holding each separately by pincers, and then dipping it in a bath of carmine, and afterwards into pure water, to give delicacy of tint; but as the colour is usually deepest in the centre, a little more dye is added there while the petal is still moist, and this diffuses itself outwards in diminishing intensity. The whiteness at the insertion of the petal is produced by touching that part with pure water after the rest is dyed.

Leaves are cut and stamped in like manner from green taffeta, cambric, calico, &c. The glossy upper surface is represented by coating the taffeta, &c., from which they are stamped, with gum-arabic; and the soft tone of the under side is obtained by means of starch coloured to the requisite shade, and brushed on when of the right consistence to dry with the proper effect. A velvety texture is given by dusting the powdered nap of cloth, which has been previously dyed of the required colour, over the gummed leaf, the gum having been allowed to partly dry till it has become 'taccy.' The superfluous portion of nap is then shaken off. Buds are made of taffeta, tinted, and stiffened, and stuffed with cotton. Stamens are made of short pieces of sewing silk stiffened with gelatine, and when dry, the ends are moistened with gum, and dipped in flour, coloured yellow, to represent the pollen. Fine wire is sometimes used for the filament of the stamen.

The flower is built up from the centre; the pistil and stamens are tied in a bunch to a piece of wire; the petals are arranged in order, and pasted; then the sepals of the calyx are pasted outside of these, and further secured by winding fine thread or silk round the lower parts. Other wires are enclosed with this thread, and form the stalk, which is bound round with green tissue paper; and at proper intervals the leaves are inserted by means of fine wires, to which they are bound, the ends of these wires being bound in and incorporated with the stalk, and concealed by the green paper.

Besides the flowers copied from nature, there is a considerable demand for what are called 'fancy flowers,' most of which are invented by the manufacturer to use up waste and spoiled fragments originally designed for better purposes.

Flowers suitable for mourning are prepared by coating leaves, flowers, &c., with strong gum, and then dusting upon them powdered galena. This substance, a sulphuret of lead, is formed naturally in lustrous cubic crystals of a dark-gray colour, and however finely it is powdered, the fragments still tend to retain the same shape and surface, and thus present a number of flat glittering facets. It is used in like manner for cheap jewellery.

FLOWERS, in Chemistry, is a term originally given by the alchemists to the sublimates which rose, or appeared to grow from certain bodies capable of undergoing volatilisation when subjected to heat.

Thus, flowers of antimony, flowers of arsenic, flowers of benjamin or benzoin, flowers of sulphur, flowers of zinc, &c.

FLOX ÆRIS is a term applied to the suboxide or red oxide of copper.

FLUE. See CHIMNEY.

FLUID. The mathematical definition of a fluid is, that it is a collection of material particles which can be moved among each other by an indefinitely small force. No fluid in nature strictly fulfils this definition, though very many do so sufficiently nearly to make the conclusions founded on the definition practically correct. Fluids are distinguished into elastic and inelastic—the former being those the volume of which is diminished by pressure, and increases when pressure is removed; the latter being those which have not this property, e. g., water and all those fluids termed Liquids (q. v.). Elastic fluids are also spoken of as compressible; and inelastic as incompressible—which, strictly speaking, no known fluid is, although all ordinary liquids are sufficiently nearly so to enable us to regard them as such without sensible error. See VAPOURS, ELASTICITY and HEAT, COHESION and CAPILLARY ACTION.

FLUKE, the pointed triangular termination to each arm of an Anchor (q. v.).

FLUKE, or **FLUKE-WORM** (*Distoma hepaticum*), an entozoon common in the liver and biliary ducts of ruminants, particularly of sheep, in which it produces the disease called *Rot*, often causing great mortality in flocks during wet seasons and on ill-drained lands. It receives its common name from its resemblance in form to the flounder, of which *fluke* is a Scotch and old English name. For a similar reason, it is sometimes called *Plaice*. It is a Trematode (q. v.) worm, higher in organisation than the cestoid worms, but not so high as the *Cœlelmintha*. It is generally not quite an inch in length, often much less, but sometimes more; of an oval form, its breadth about half its length; flat, in colour not very different from the liver in which it exists: it has no eyes nor other known organs of special sense; it is hermaphrodite, and the organs of reproduction occupy great part of its body, the ovaries being ranged along the margin; its anterior extremity is furnished with a sucker, and another is situated at a small distance on the ventral surface, whence the name *Distoma* (Gr. two-mouthed), but the terminal sucker alone is perforated, and serves as a mouth, by which bile—the food of the creature—is imbibed; the tube which proceeds from it not, however, becoming a proper intestinal canal, but soon dividing into two large branches, and ending in minute ramifications in all parts of the body. Prodigious numbers of flukes are sometimes found in the liver of a single sheep, and of very different sizes, but they are now believed not to multiply there as was formerly supposed. Their eggs, indeed, are produced there in great quantity, but find their way into the outer world to begin a series of transformations not yet very accurately traced with regard to this particular species, but of which the general nature is known. See CERCARIA, TREMATODE WORMS, and GENERATION, ALTERNATION OF. It seems that the young flukes, having entered as *Cercariæ* into the bodies of molluscs or of aquatic insect larvæ, are conveyed into the stomachs of ruminants feeding on herbage to which these are attached, and finding their way to the liver, there attain their full development. See ROT.

Fluke-worm (*Distoma hepaticum*).

Instances have occurred of the presence of *Distoma hepaticum* in the human liver and *vena portæ*; as well as of a similar species, *D. lanceolatum*; a small species of the same genus, *D. heterophyes*, has been found in great numbers in the human intestines in Egypt, but its influence on the system is unknown; a species of much elongated form, *D. hæmatobium*, is very common in Egypt, infesting the *vena portæ* of man, and the walls of the urinary bladder, and producing local, and afterwards general disease; a small species, *D. ophthalmobium*, has been found in the human eye, but probably through some such accident as in another case has led to the occurrence of the common fluke under the skin of the foot, where it caused a sore. Of all the known species, the Egyptian, *D. hæmatobium*, is by far the most hurtful, as infesting the human body. This species is also remarkably different from the others, in not being hermaphrodite, and in the extreme dissimilarity of the male and female; the female being a thread-like worm, for which a lodgment is provided in a furrow (*gynæcophorus*) on the ventral surface of the male.

The genus *Distoma* or Fluke contains a great number of species, infesting, in their mature state, different kinds of animals, and finding their appropriate place in very different parts of the animal frame. The wrinkled membrane around the eyes of birds is the place of some.

FLUOR SPAR, a mineral which has been often described as chemically *Fluate of Lime*, a compound of fluoric (hydrofluoric) acid and lime, but which is in reality *Fluoride of Calcium* (CaF), consisting of 48·14 fluorine and 51·86 calcium (the base of lime). It occurs both crystallised and massive: the massive varieties exhibiting a crystalline structure; the crystals usually in groups, sometimes of the primary form, which is a cube, but often of secondary forms, of which there is great variety, as the octahedron, rhombic dodecahedron, &c. F. S. is sometimes colourless, but often green, blue, yellow, or red, more rarely gray, or even black; different shades of colour frequently appearing in the same specimen, and in the massive varieties beautifully intermixed. Its colours often rival those of the most beautiful gems; but it is of very inferior hardness, being scratched even by quartz. Its specific gravity is 3·14. It generally becomes phosphorescent when heated, although this is more remarkably the case with some varieties than with others; it is decomposed by heated sulphuric acid, with evolution of hydrofluoric acid as a pungent gas, which, having the property of acting upon and corroding glass, F. S. is used with sulphuric acid for etching on glass. F. S. is also used for ornamental purposes, being wrought into vases, &c., for which it was in high esteem among the ancients. But the greater abundance in which it is now obtained has diminished the value of ornaments made of it. It is very commonly associated with ores of tin, silver, lead, and copper, occurring chiefly in veins, but is also found by itself in drusy cavities in granite, greenstone, &c. It is found only in a few places in Scotland, and in insignificant quantity, but is nowhere more abundant than in England, particularly in Derbyshire and in Cornwall. In Cornwall, it is used as a flux for reducing copper ore. In Derbyshire, the blue massive variety is known to the miners as *Blue John*. The manufacture of ornaments of F. S. is carried on to some extent in Derbyshire. F. S. is often called DERBYSHIRE SPAR.

FLUORE'SCENCE is the term applied to a peculiar blue appearance exhibited by certain substances exposed to sunlight, and especially observable in a dilute solution of sulphate of quinine.

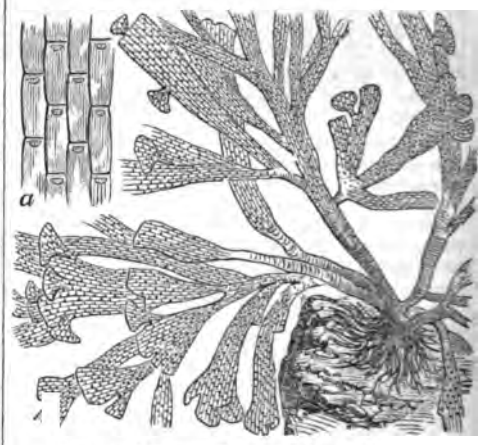
FLU'ORINE is an elementary substance allied to chlorine. Its principal natural source is the mineral, fluor spar (CaF), although it is also found in minute quantities in the igneous rocks, natural waters, plants, the bones and teeth of animals, as also in milk, blood, &c. Many attempts have been made to isolate fluorine, but these have all failed, owing to the extremely energetic nature of the substance, which causes it to unite with substances the moment it is liberated from a previous state of combination. Thus, if fluorine is evolved in glass, gold, platinum, or other metallic vessels, it immediately acts upon and unites with the material of the vessel, and ceases to be free and pure. It would appear, however, to be a gaseous substance, having the equivalent number 19, and with properties similar to chlorine, though differing in energy of action. The compounds of fluorine are not numerous, but are important. *Hydrofluoric acid*, or *fluoric acid* (HF), is generally prepared by heating gently in a lead still a mixture of one part of fluor spar (CaF) with two parts of sulphuric acid ($HOSO_3$), when the vapours of hydrofluoric acid (HF) are evolved, whilst sulphate of lime ($CaOSO_3$) is left in the still. The dense acid vapours are conducted through a lead pipe into a lead receiver or bottle, surrounded by a freezing mixture of ice and common salt. The acid is generally mixed with water when desired to be kept for some time. When the most concentrated hydrofluoric acid is required, the still and receiving vessel must be made of platinum. The other metals are not suitable for such apparatus, as they are rapidly corroded by the acid. When prepared in its strongest form, hydrofluoric acid has the density of 1060 (water = 1000), and is a colourless, fuming liquid of great volatility, which boils at 60° F., and does not freeze at −4 F. Not only does hydrofluoric acid corrode and dissolve the ordinary metals (excepting lead and platinum), but when placed on the skin, it produces a severe burn, owing to its caustic nature. The most important property which hydrofluoric acid possesses is its power of eating into and dissolving glass, which admits of its application in the etching of characters upon glass, as in thermometer tubes, and for eating away greater or less thicknesses of plates or sheets of coloured glass, so as to produce a variety of shades. See GLASS-ETCHING and GLASS-STAINING.

FLUO'ROTYPE, a process in which salts of fluoric acid are employed for the purpose of producing pictures by the agency of light. It was suggested by Robert Hunt in 1844. Two solutions are prepared: one containing 20 grains of bromide of potassium to an ounce of water; and the other, 5 grains of fluoride of sodium to an ounce of water. These are mixed together just previous to using, and applied uniformly over the whole surface of good paper, which is then allowed to dry, and afterwards rendered sensitive by brushing over it a solution of nitrate of silver, sixty grains to an ounce of water. Papers so prepared may be used for the production of pictures in the camera or printing-frame; they require, however, to be intensified by development with protosulphate of iron, the reducing action of which should be regulated by the addition of acetic acid to the solution. The sensibility of the papers for camera-work may be much increased by brushing over them a weak solution of protochloride of tin previous to exposure.

FLUSH, a term used in the navy in reference t decks, which are said to be flush when extendin without break on one level from the bow to th stern. Frigates and all smaller vessels of wa (excepting a few steamers) are now constructe with flush upper-decks; but what are technicall termed 'flush-decked ships,' are such as have a their guns on the upper-deck, as corvettes, sloops brigs, and smaller vessels.

FLU'SHING (Dutch *Vlissingen*), a strongfortres and seaport of the Netherlands, in the province o Zealand, is situated on the south coast of the islan of Walcheren, on the northern shore of the mouth of the Western Scheldt, in lat. 51° 26′ N., and long 3° 36′ E. It is the most important naval station o the Netherlands, is well built, and has extensive dockyards. Its harbour is protected by two moles from the violence of the sea, with which, however, two canals within the town, sufficiently large and deep to allow of the largest merchant-vessels unloading at the quays, communicate. F., with the forts of Rammekens and Breskens in the vicinity, commands the entrance of the Scheldt. It is strongly fortified, and has important wharfs and arsenals. It also carries on a considerable commerce with India, England, and other countries. Pop. 10,000. F. is the birthplace of Admiral de Ruyter. It was stormed and taken by the English in the Walcheren expedition under Lord Chatham, in 1809.

FLU'STRA, a genus of zoophytes, of the class *Polyzoa* (or *Bryozoa*), and order *Infundibulata*, some of the species of which are very common on the British shores. The name is said to have been derived by Linnæus from the Saxon *flustrian*, to



Portion of Flustra Truncata (from Johnston's *Zoophytes*):
a, a few cells magnified.

weave, because of the mat-like structure of the polypidoms, which in this genus are extremely plant-like, and by unscientific observers are generally regarded as belonging to the vegetable, and not to the animal kingdom. In some species, the polypidom assumes the appearance of a branching frond, with polype cells either on one side only, or on both sides; in others, it extends as an incrustation on rocks, shells, sea-weeds, &c. The polype cells are arranged quincuncially, and are in juxtaposition, more or less quadrangular, flat, and with a distinct border, which is sometimes furnished with teeth or short spines. The polypes have the power of moving either the whole head

at once, or the tentacles separately, and shew no little activity, so that a living F., seen through a magnifying-glass, is a most beautiful and interesting object. One of the most common British species is *F. foliacea*, which grows on hard ground in a few fathoms' water, and is continually to be found torn up by the waves, and scattered on the shore. It is an interesting fact, that the same species occurs in the Pacific Ocean.—A single square inch of *F. cardinea*, another common British species, has been found to contain 1800 cells; and as there are about ten square inches in an average polypidom, a single specimen may ordinarily contain about 18,000 polype heads.

FLUTE, one of the oldest wind instruments, well known to the ancient Greeks, has a soft and pleasant quality of tone, is an important instrument in orchestral music, and, in consequence of its easy treatment, is, in modern times, much in favour with amateurs. The flute is commonly made of boxwood or ebony, but sometimes of ivory or silver. Its form is that of a taper tube, made in four pieces, with six holes for the fingers, and with from one to fourteen keys, which cover or open other holes. The sound is produced by blowing from the mouth into the embouchure, an oval kind of hole at one side of the thick end, which is done by the lips covering a part of the hole, so that the air in its passage from the mouth is broken against the opposite edge of the hole, which causes the column of air inside the tube to vibrate. The notes of the gamut are produced by the opening or shutting of the holes by the fingers of both hands. The compass of the flute is from D to A sharp, nineteen diatonic intervals. For solo-playing, a flute with a compass from G to C is sometimes used. For orchestral purposes, there are also the *tierce* flute, the octave flute, the E flat and F piccolo flute; and the highest of all, the C piccolo. Improvements on the flute have been made from time to time by Quantz, Kilock, Tromnlitz, and especially by Böhm in Germany, and by Rudell and Rose in London.

FLUTE-WORK, the name given to a particular class of stops in organ-building, in contradistinction to *reed-work*. There are also numerous stops in German organs, specially designated with the names of flutes of different kinds, of eight feet and four feet pitch, some of which have lately been introduced into English organs.

FLUTING, the mouldings in the form of hollows or channels cut vertically on the surface of columns. These were adopted by the Greeks as ornaments to their Doric, Ionic, and Corinthian columns, and were retained by the Romans in their architecture. The Tuscan is the only style without flutes. In Doric (fig. 1), there are 20 flutes on the circumference, and

Fig. 1.

Fig. 2.

the curves meet with a sharp edge. These curves are supposed, in Greek Doric, to be elliptical, and they are carried up across the necking to the base of the cap. In the other styles, there are 24 flutes on the circumference (fig. 2). These are semicircular, and are separated by a small fillet; and, before reaching the necking and the base, are terminated with semicircular top and bottom.

Flutes are said to be cabled when they are filled in to about ⅓ of their height from the base with a convex bead. This is done to strengthen the column and protect the flutes. In countries where Roman remains were abundant, as in the south of France, fluting was sometimes adopted by the early medieval architects, as at Arles and Autun. In Italy also, traces of this decoration are visible during the middle ages; but the flutes soon ceased to be vertical, and, in Romanesque Architecture (q. v.), assumed many varieties of forms, such as curves, zigzags, &c., twisting round the shafts.

FLUX (*fluo*, I flow) is the term given to the substances employed in the arts which cause or facilitate the reduction of a metallic ore and the fusion of the metal. *White flux* is an intimate mixture of ten parts of dry carbonate of soda and thirteen parts of dry carbonate of potash, and is mainly instrumental in withdrawing the silica or combined sand from mineral substances; *black flux* is prepared by heating in close vessels ordinary cream of tartar (bitartrate of potash), when an intimate mixture of finely divided charcoal and carbonate of potash is obtained. The latter flux, when mixed with finely divided metallic ores, and the whole raised to a high temperature in a furnace, is not only useful in removing the silica, which the carbonate of potash it contains enables it to do, but the charcoal withdraws the oxygen from the metallic oxide, and causes the separation of the pure metal. Limestone is employed as the flux in the smelting of iron ores. The other fluxes are fluor spar, borax, protoxide of lead, &c. See IRON, COPPER, &c.

FLUX (Lat. *fluxus*, from *fluō*, I flow), a discharge, generally from a mucous membrane. The term is applied more or less frequently to all preternatural fluid evacuations from the body, but especially to those from the bowels, and from the uterine organs. Dysentery (q. v.) was long termed the bloody flux, to distinguish it from simple diarrhœa. Another scientific term for flux is Profluvium, which gives the name to a large order of diseases in Cullen's *Nosology*. See also CATARRH, MENSTRUATION, and, with respect to etymology only, RHEUMATISM.

FLUXIONS, in Mathematics. The method of fluxions invented by Newton was intimately connected with the notion of velocity uniform and variable; and extended that notion, derived from the consideration of a moving point, to every species of magnitude and quantity. It proposed to determine, in all cases, the rate of increase or decrease of a magnitude or quantity whose value depends on that of another, which itself varies in value at a uniform and given rate. If x and y represent two such quantities, and $y = F(x)$ represent the law of their dependence, and if $\dot{x}$ be supposed to be the velocity with which x increases, and $\dot{y}$ that with which y changes value. Newton undertook by his method to express $\dot{y}$ in terms of $\dot{x}$ and of x, or to find $y = F_1(x) . \dot{x}$. The quantities x and y, which in modern language we call the variables, he called *flowing* quantities or *fluents*, and $\dot{x}$, $\dot{y}$, which we should represent by dx and dy, and call differentials, he called the *fluxions* of x and y. See CALCULUS. To illustrate his notation: suppose $y = x^n$, it may be shewn that $\dot{y} = nx^{n-1}\dot{x}$. Regarding now $\dot{y}$ as a quantity depending on x and $\dot{x}$, and supposing x to increase uniformly, in which case $\dot{x}$ is constant, and $(\dot{x})$ its fluxion zero, we observe that $\dot{y}$ may have a fluxion, for

it depends on the value assumed by $nx^{n-1} \cdot \dot{x}$, when x further changes. We find $\dot{(y)} = n \cdot (n-1) \cdot x^{n-2} \cdot (\dot{x})^2$. Thus, second fluxion or velocity of $\dot{y}$, or $\dot{(y)}$, Newton wrote $\ddot{y}$. If x had a second fluxion, or did not change uniformly, then that fluxion he wrote $\ddot{x}$. The third fluxion of y he wrote $\dddot{y}$; and so on, pointing as many points over the fluent as there are units in the order of the fluxion. For the fluent, he had no special symbol. Instead of $\int nx^{n-1}dx = x^n$, according to the modern notation, he wrote $\overline{|nx^{n-1} \cdot \dot{x}|}$, putting the expression in an enclosure. For the principles on which Leibnitz founded his calculus and its notation, see CALCULUS.

FLY, a popular name often given to insects of the order *Diptera* (q. v.) generally, sometimes extended to insects of other orders, and sometimes limited to the *Muscides* (q. v.). It is often used with a prefix, as house-fly, blow-fly, &c., to designate particular kinds of insects.

FLY-CATCHER (*Muscicapa*), a genus of birds of the order *Insessores*, tribe *Dentirostres*, and family *Muscicapidæ*, having a moderately long angular bill, broad and depressed at the base, compressed and slightly curved at the point; the base surrounded with hairs or bristles directed forwards, and which help to secure insect prey. The legs and feet are small; the outer toe the longest, and attached to the middle one as far as the first joint. The wings are not long; their first quill-feather is very short; the third is the longest. The birds of this genus, as now restricted, are exclusively confined to the Old World, and mostly to the warmer parts of it. Of the numerous North American birds often called fly-catchers, some belong to nearly allied genera, and others to genera not now ranked even in the same family. The true fly-catchers all have the habit—

Spotted and Pied Fly-catchers (*Muscicapa grisola* and *M. atricapilla*).

characteristic of many of the *Muscicapidæ* besides this genus —of remaining perched for a long time in the same spot, only leaving it to make a sudden dart at a passing insect, which is seized with a snap of the bill, and then returning. They are almost never to be seen running on the ground, or even on the branches of trees, and do not chase insects in the air like swallows. Only four species are European, two of which are British—the SPOTTED F. (*M. grisola*) and the PIED F. (*M. atricapilla* or *luctuosa*); birds about the size of a sparrow, the former of which is common in most parts of England, as a summer bird of passage, but rare in Scotland; the latter is rare in Britain, although abundant in the south of Europe. The spotted F. is brownish gray above, white beneath, the head and breast marked with dusky spots. Its voice is a mere chirp. It is remarkable for the choice it makes of situations for its nest, often on a beam in an outhouse, on the side of a fagot-stack, on the branch of a tree trained against a building, and sometimes even on a lamp-post in a street. Mr Durham Weir of Boghead, who was a diligent observer of the habits of birds, mentions that he witnessed a single pair of spotted fly-catchers feed their young no fewer than five hundred and thirty-seven times in one day, and that their motions were so rapid that he could not keep his eye off the nest for a moment.

The name F. is often extended to other genera, and is sometimes used as co-extensive in signification with that of the family *Muscicapidæ*.

FLY-POWDER is the name given to a compound of metallic arsenic and arsenious acid, obtained by the partial oxidation of the metal, on exposure to air, and which is sold on the continent for the purpose of killing flies.

FLY-TRAP. See DIONÆA.

FLYING, or FLIGHT, is the locomotion of an animal in the air, by means of *wings*, organs specially adapted to that purpose. By means of these organs, the animal raises itself from the ground and sustains itself in the air, as well as moves forward in any direction it desires. Birds and bats are the only existing vertebrate animals possessing the power of true flight; the lateral membranes of Flying Squirrels, Flying Lemurs, Flying Phalangers, and Flying Dragons, and probably even the great pectoral fins of Flying Fishes, serving only to sustain them in the air after the manner of a parachute, or at most to aid, on the principle of a boy's kite, in an oblique ascent. The extinct reptiles called Pterodactyles (q. v.) possessed, however, the power of true flight, as their remains sufficiently testify; and their wings were constructed on a plan as different from those both of birds and of bats as these (see BIRDS and BATS) are from each other. The wings in all vertebrate animals are the anterior limbs, and are thus homologous to the arms of man and the forelegs of ordinary quadrupeds; in birds, the bones answering to those of the hand are much abbreviated and consolidated; in bats, they are prodigiously elongated; in pterodactyles, there was an elongation of a single finger. Among birds, although the power of flight is general, there are exceptions to the rule, the wings of some being merely rudimentary, and at most only helpful to them in running, those of others being adapted to swimming, not on the surface of, but under water.—The only invertebrate animals possessing the power of flight are insects; to the greater part of which vastly numerous class it belongs in their perfect state, although there are also many insects which are quite destitute of it, and this is sometimes the case with species very closely allied to others which possess it, nay, sometimes this great difference exists between the sexes of the same species. The wings of insects are not at all homologous to those of the flying vertebrata, although applied to the same use, and in structure are widely different from them all. See INSECTS.

In flying, the wings are made to beat or strike the air. The stroke in the one direction, however, must be very different from that in the other, or rather from that movement by which the wing is brought

back to its place for another stroke. This difference is secured partly by greater force of muscular action, and consequent rapidity; the resistance of the air varying as the square of the velocity with which the wing moves in giving the stroke. But it is also secured partly by the conformation of the wing itself, the quill feathers of birds being so placed that they strike the air with their greatest extent of surface in the proper stroke of the wing, and *obliquely as it returns to its place.* An imitation of this is made in the rowing of a boat, and is called *feathering the oar.* The wings of bats, consisting of a membrane extended upon jointed bones, are probably in part folded up in order to the return from every stroke; and this is perhaps the case also with the wings of some insects, although those of others—as the Common Fly and the Bee—are certainly incapable of it; yet it is possible that even these may have a greater degree of rigidity communicated to them by the inflation of their air-tubes during the stroke than they have during the return.

Flying is analogous to swimming; but the difference of medium is very great, fresh water being about 800 times heavier than air, and the density of sea-water still greater. The bodies of animals intended for flight are therefore sometimes adapted to it partly by means which tend to diminish their proportionate weight, as the air-cavities in birds and insects; which, however, are still more important in relation to the increase of muscular power; and it is chiefly by the increase of muscular power that the power of flying is imparted. The exercise of strength requisite for swimming is comparatively small, about $\frac{1}{700}$th part only of that which is requisite for flying. How wonderful, then, the muscular power of birds capable of long-sustained flight, far exceeding in rapidity the speed of the swiftest locomotive engine ever constructed by man! or of insects, which in respect at least of rapidity, is in some species not inferior to that of the swiftest birds! The muscular power exerted in flying evidently differs very much both among birds and among insects. The large wings of some require also much less frequent muscular action, either to sustain the body in the air, to elevate it, or to move it forward, than the comparatively small wings of others. The motion of the wings of humming-birds and of insects is too rapid for the eye to follow.

It is not to be wondered at that projects of locomotion through the air have been much entertained by men, nor that, whilst the force of the objections already stated was unknown, artificial wings, and an imitation of the flight of birds, occupied the ingenuity of inventors. Grecian fable ascribes success to the mythic Dædalus (q. v.), who is said to have passed safely over the Ægean Sea on wings which he himself had made. More modern stories of similar success, although in far shorter flights, are numerous, but often resolve themselves, when carefully examined, into exaggerated accounts of feats performed on ropes, wings having been perhaps employed to render the exhibition more attractive, perhaps also to render the performance more easy by their extent of surface and resistance to the air. Other instances are on record of persons who, apparently by some parachute-like contrivance, descended obliquely from high towers to a considerable distance; as, in the 13th or 14th c., Elmerus, a monk, is said to have flown more than a furlong from the top of a tower in Spain, but the distance is probably much exaggerated; and in the 17th c., Besnier, a locksmith of Sable, in France, who prudently began from windows one story high, ventured at last and safely to leap from very elevated positions, and so passed over houses or over rivers of considerable breadth. All these, however, were mere feats destitute of utility, although they encouraged the expectation of better results, which was cherished by some of the most scientific men of that period. Bishop Wilkins, in particular, devoted much attention to this subject. Perceiving the inadequacy of the human arm and the muscles which move it to give sufficiently rapid motion to wings of sufficient size, he suggests that 'it were therefore worth the inquiry to consider whether this might not be more probably effected by the labour of the feet, which are naturally more strong and indefatigable.' So confident was he of success, that he anticipated the time when a man should as readily call for his wings to make a journey, as he then did for his boots and his horse. More recently, in the end of the 18th and beginning of the 19th c., Sir George Cayley occupied himself with speculations and experiments on this subject. Acknowledging the difficulty which arises from the want of muscular strength in man, he says: 'It is only necessary to have a first mover, which will generate more power in proportion to its weight, than the animal system of muscles.' But this first mover has not hitherto been found. The employment of steam for this purpose has been frequently proposed. Attempts of this kind, however, have rather for their object aërial navigation than artificial flying, properly so called; although the inventions have been variously designated aërial ships, flying machines, &c. A great difficulty has been found in the weight of the steam-engine and its fuel; and experiments which have cost no small sums, and have excited not a little of public attention, have signally failed through miscalculation on this essential point. Not unfrequently, attempts have been made to combine some modification of the balloon with the steam-engine or other means of propulsion. In no instance, hitherto, has there been the least approach to success, although a *European Aëronautical Society* was formed, and issued its advertisements in 1835; and about eight years afterwards, an *Aërial Transit Company* not only amused the public

Flying Machine, invented by Mr Henson, 1843.

for a considerable time, but obtained the assent of the British House of Commons to a bill for its constitution. Models have sometimes been exhibited of aërial machines capable of being guided at the pleasure of the aëronaut, in a perfectly still atmosphere, but nothing has yet been invented capable of serving any practical or useful purpose. There is, however, nothing evidently contrary to science or sound philosophy in proposals for aërial navigation, which, in this respect, differs widely from human or artificial flying.

Perhaps the *aëronautic fish*, on which Marshal Ney is said to have spent 100,000 francs, and which for a considerable time occupied the attention of some of the most ingenious and scientific men in France, deserves particular notice. It was a large balloon, of a long fish-like figure, intended to swim in the air, as a fish in water, and to be propelled by wings or fins working by cranks; an oblique

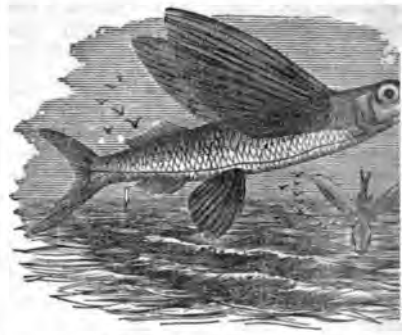
upward direction was to be given to its motion, by a weight placed near the tail; a downward direction by the same weight hauled forward to near the head. But when launched, although it floated and moved forward a little, it turned on one side, and this tendency could not be corrected, so that the experiment proved a complete failure. For further information, see *Chambers's E. Jour.*, No. 227. N. S.

FLYING BRIDGE. See FERRY.

FLYING DRAGON, or FLYING LIZARD (*Draco*), a genus of saurian reptiles, allied to iguanas and stellions, but remarkably distinguished from them, and indeed from all other reptiles now existing, by lateral membranes which support them in a parachute-like manner in the air, and enable them to pass from tree to tree, even to considerable distances. These membranes are supported on the first six false ribs, which, instead of encircling the abdomen, stand out at right angles from the body for this purpose. They are incapable of the movements requisite for true flying; when not in use, they are folded close to the body. There is also in the flying dragons an inflatable pouch under the chin, sustained partly by the hyoid bone and partly by two small bones. The tail is long. The scales are small and imbricated; those of the tail and limbs are keeled. The tongue is extensile, but not greatly so. All the species are of small size, live among the branches of trees, and feed on insects. They are natives of the East Indies. The genus is subdivided by some naturalists. One of the species is figured in the article DRAGON.

FLYING FISH, a name given to all those fishes which have the pectoral fins so very large that by means of them they are sustained in short seeming flights in the air. These fishes belong to two very different families—*Scomberesocidæ* and *Sclerogenidæ*; but the name F. F. is sometimes limited to those of the former family, the genus *Exocœtus*; those of the latter being known as *Flying Gurnards*. The genus *Exocœtus* has the pectoral fins nearly as long as the body, the dorsal fin placed over the anal, the tail forked, and its lower division considerably larger than the upper. It is subdivided by some naturalists into several genera, characterised by the presence or absence of barbels, &c. Two species have occasionally been seen near the British shores, one of which (*E. volitans*) is very abundant in the warmer parts of the Atlantic Ocean, the other (*E. exiliens*) is common in the Mediterranean. In the former, the ventral fins are situated far forward, and are short; in the latter, they are situated far back, and are considerably elongated. More than thirty species are known, all inhabiting the seas of the warmer parts of the world, and having their respective geographical limits pretty exactly defined.

They swim in shoals; and whole shoals—varying in number from a dozen to one hundred or more—often leave the water at once, darting in the same direction through the air, and after descending into the water at a distance of two hundred yards, or even more, from the place where they arose, quickly renewing their flight. These flights of flying-fishes form one of the most interesting and pleasing spectacles which relieve the monotony of a voyage in the tropical seas. Sometimes, the coryphene (dolphin) may be seen in rapid pursuit, taking great leaps out of the water, and gaining upon his prey, which take shorter and shorter flights, vainly try to escape by doubling like the hare, and sink at last exhausted: sometimes the larger sea-birds catch flying-fishes whilst they are in the air; but it does not seem to be at all true that these fishes leave the water, as has been very generally imagined, merely to escape from danger, nor is there any good reason for that sentimental pity which has been expressed with regard to them, as creatures [illegible] and persecuted more than others, and [illegible]



Flying Fish (*Exocœtus volitans*).

exposed to dangers both in the sea and in [illegible] They seem rather to exercise their power [illegible] other creatures, very often merely from the [illegible] which they take in the exercise of them, as [illegible] the exuberance of their happiness.—The question [illegible] whether or not the flying fishes use their [illegible] fins at all as wings, cannot yet perhaps be considered as completely decided; some observers, well [illegible] to respect, maintain that they do, although [illegible] course, their power of flight is limited to [illegible] that the fins remain quite moist; but a great [illegible] ponderance of testimony is in favour of the [illegible] opinion, which regards the fins as acting [illegible] after the manner of a parachute or of [illegible] Flying fishes sometimes rise to a height of [illegible] feet above the water, although they more frequently [illegible] skim along nearer to its surface. They often [illegible] on the decks of ships. They are good food [illegible] the natives of the South Sea Islands take them [illegible] means of small nets attached to light poles [illegible] those in which anglers catch minnows for bait. [illegible] this purpose, they go out at night in canoes [illegible] outer edge of the coral reefs, with a torch [illegible] enables them to see the fishes, and perhaps [illegible] attracts and dazzles them.

FLYING FOX. See KALONG.

FLYING GURNARD (*Dactylopterus*), [illegible] of fishes of the family *Sclerogenidæ* or [illegible] Cheeks, nearly allied to the Gurnards (*Tri*[illegible]) remarkably distinguished by the great size [illegible]

Flying Gurnard (*Dactylopterus volitans*)

pectoral fins, which they use for the same [illegible] and in the same way as the *Exocœti*. See FISH. The pectoral fins are, however, of [illegible] different appearance from those of the [illegible] widening almost to the end, which is round [illegible] the tips of the rays extending considerably

the membrane. A very long spine rises from the back of the head. One species (*D. volitans*) is common in the Mediterranean, and is sometimes fifteen inches in length. Its flight is said not to extend to more than about forty yards, but it sometimes rises high enough to fall on the decks of large ships. 'At particular times, especially on the approach of rough weather, in the night, numbers of them may be seen, by the phosphoric light which they emit, making their arched passages in apparent streams of fire.'—Another species inhabits the Indian seas. —Some species of *Apistes*, belonging to the same family, have similarly large pectorals, and make similar flights.

FLYING LEMUR, or COLUGO (*Galeopithecus*), sometimes also called FLYING CAT and FLYING FOX, a genus of mammalia, generally regarded as constituting a distinct family, *Galeopithecidæ*, which, by some naturalists is placed, as by Cuvier, among the *Cheiroptera* (see BAT), although it is now more commonly associated with the Lemurs (q. v.), as by Linnæus. There are, indeed, evident affinities both to lemurs and bats, but chiefly to the former, with which the osteological and other anatomical characters generally agree. Along the sides extends an ample membrane or fold of the skin, beginning behind the throat, and including both the fore and hind legs as far as the toes, but leaving them free, and further stretched along both sides of the tail to the tip. In the last particular, it differs from the lateral membrane of the flying squirrels and flying phalangers, and more resembles that of bats; but it widely differs from that of bats in being comparatively thick, and covered on both sides with short thick hair; and still more in leaving the fore-feet free, and not being stretched on lengthened finger-bones. Nor can it be used for true flight, but only to support the animal in the air like a parachute, enabling it to take enormous leaps of one hundred yards or thereby in an inclined plane. It is not yet satisfactorily determined whether the differences to be observed between the specimens of flying lemurs in collections, are to be regarded as differences of species or of variety. Attempts have been made to distinguish several species, but it is difficult on account of their great similarity. They are from twenty inches to two feet in total length, are natives of the Indian Archipelago, inhabiting lofty trees in dense forests, and feeding on small birds' eggs and fruits, as well as on insects. They are nocturnal in their habits. They are very inoffensive, and scarcely attempt to bite even when seized. Their voice resembles the low cackling of a goose. They produce generally two young ones at a birth. The Pelew islanders greatly esteem them as food, but they have a rank unpleasant smell.

FLYING PHALA'NGER, or FLYING OPO'SUM (*Petaurus*), a genus of marsupial quadrupeds, containing several species, natives of New Guinea and of Australia, where they are generally called Squirrels or Flying Squirrels. They are nearly allied to the Phalangers (q. v.), which they particularly resemble in dentition, but have not the tail so long and prehensile, whilst they are distinguished by a hairy membrane or fold of the skin extending along the flanks, and used as a parachute to enable them to leap to great distances. This membrane extends along both fore and hind legs almost to the toes, but does not appear behind the hind legs, nor includes the tail, which is pretty long and bushy, but which in some of them has a *distichous* character, the hair spreading out to the sides, and so rendering it useful in supporting as well as in guiding the body in the air. They are capable of modifying their course in the air, although not of true flight; and their aërial evolutions are very graceful. They repose during the day, and become active in the evening. They feed on fruits, leaves,

1, Flying Phalanger (*Petaurus Taguanoides*); 2, Flying Mouse (*Petaurus Pygmæus*).

insects, &c. A New Guinea species is about as large as a flying lemur; one of the Australian species is scarcely larger than a mouse. The fur of some of them is rich and beautiful.—PETAURIST has been proposed as an English name for this genus; but is not much used.

FLYING SQUID (*Ommastrephes*), a genus of cephalopodous molluscs, allied to the Calamaries (q. v.) or squids, but differing from them in having the eyes exposed and not covered with skin, the fins united into one as a tail, and the *gladius* or bone furnished with three diverging ribs and a hollow conical appendage. The tail is large, and the power of locomotion great, so that these molluscs not only pass rapidly through the water, but leap out of it, and high enough sometimes to fall upon the decks of ships. They form a principal part of the food of many of the *Cetacea*, and are often the prey of albatrosses, petrels, and other marine birds. They are used as bait for cod in the Newfoundland fisheries.

FLYING SQUIRREL (*Pteromys*), the name given to a considerable number of species of the Squirrel family (*Sciuridæ*), which have a fold of the skin of the flanks extended between the fore and hind legs, and partly supported by bony processes of the feet, by means of which they are enabled to take extraordinary leaps, gliding for a great distance through the air. The tail also aids to support them in the air, as well as to direct their motion, its hairs extending laterally 'in a sort of fe*thery expansion.' The dentition is similar to that of true squirrels, with which also the habits generally correspond. One species (*P. Sibiricus*) is found in the north of Europe and of Asia; several species are natives of North America, and others inhabit the south-east of Asia and the Indian Archipelago. The European species is about the size of a rat, grayish-ash colour above, white below, the tail only half the length of the body; it lives solitarily in the forests. Its fur is of little value, but skins are sometimes mixed with those of the gray squirrel, to impose on the purchaser. The most common North American species (*P. volucella*), abundant from the Gulf of Mexico to Upper Canada,

is fully five inches long, with a tail of five inches additional, fur included. It is of a brownish-gray colour above, white beneath; a black line surrounds

Flying Squirrel (*Pteromys volucella*).

the orbit of each eye. All the species inhabit woods, and the night is their time of activity. They feed not only on nuts and young shoots of trees, but also on small birds. They are extremely easy of domestication.

In gliding from tree to tree, the common American flying squirrel descends obliquely and with very rapid motion, until near the tree which it seeks to reach, when it wheels upwards, and alights at about a third of the height which it was from the ground on the tree which it left, the distance between the trees being perhaps fifty feet.

FLY-WHEEL, a large heavy wheel applied to a steam-engine or other machinery in order to equalise the effect of the moving power. Its action depends upon the principle, that a body once set in motion retains a certain amount of moving force or *momentum*. This increases with the weight of the body and the velocity of its motion, and may be expressed relatively by multiplying the weight by the velocity; or stated otherwise, the force required to destroy the motion of a body is equal to that which set it in motion. Thus, a heavy wheel becomes a sort of reservoir of force, when set in motion.

There are two principal cases in which the fly-wheel is commonly applied: first, when the motive power is intermittent or irregular; and second, when the resistance or work to be done is intermittent or irregular. The crank is a good example of the first case. If the force be applied only downwards, as in the common foot-lathe, it will be intermittent, and the crank must rise independently of the prime mover. This is effected by applying a fly-wheel, which is set in motion by the descending pressure of the foot acting upon it through the crank; and the momentum it has thus acquired lifts the crank again to the point where it can be acted upon by the foot. It also carries the crank over the *dead points* (see CRANK), where even a double action of pulling and pressing would be ineffective. The case of a steam-engine turning a long shaft which passes through several workshops, and by means of bands drives a number of lathes, punching, drilling, planing machines, &c., is a common example of the second case, the resistance or work to be done being very variable from one moment to another. In such work as that of a punching-machine, the engine need not be nearly of sufficient power to directly force the punch through the metal, and yet by the aid of the fly-wheel it may do it; for while the punch is rising, the engine is communicating momentum to the fly-wheel; and when the descending punch meets with the resistance it has to overcome, this reserved momentum is added to the direct power of the engine, the punch is forced through, and the speed of the fly-wheel slackened, in proportion to the resistance.

The principle of the fly-wheel is sometimes applied in other forms than that of a wheel, as in the hand-coining press, where a heavy ball is fixed at each end of a long lever, which is made to swing round with considerable velocity, and the accumulated momentum is concentrated upon the blow.

FO. See BUDDHA.

FO'CHABERS (of old, *Fochobyr*, and still locally styled *Fochaber*), a small, neat village and burgh of barony on the right bank of the Spey, in Morayshire. Pop. about 1500. The parish church stood formerly at Bellie, in Banffshire, about two miles nearer Speymouth, and in the immediate neighbourhood of an old encampment, which has been supposed to be the Tuessis of Ptolemy. Gordon Castle, the old 'Bog of Gight,' formerly the seat of the Duke of Gordon, now of the Duke of Richmond, stands between F. and a bridge across the Spey, built about the year 1803, partly destroyed by the flood of 1829, and since partly rebuilt in wood. The site of F. is peculiarly fine, lying as it does at the mouth of a picturesque ravine, watered by a mere rill falling into the rapid Spey, but swelling in times of flood into a wider stream than that which it feeds.

FOCI'METER. See CLAUDET'S FOCIMETER.

FOCUS. Certain points in the ellipse, hyperbola, and parabola are called foci. See ELLIPSE, HYPERBOLA, and PARABOLA. Focus, in Optics, is a point in which several rays meet and are collected after being reflected or refracted, while a *virtual* focus is a point from which rays tend after reflection or refraction. The principal focus is the focus of parallel rays after reflection or refraction. See LENS, MIRROR, and CATOPTRICS and DIOPTRICS.

FODDER (Ger. *futter*, Anglo-Sax. *fuldor*), the food collected by man for the use of the domestic herbivorous quadrupeds. In English, the term is commonly restricted to dried herbage, as hay and straw; but in other languages, it is more comprehensive, and includes all the food of cattle, except what they gather for themselves in the field.

The principal part of the food of all the domestic herbivora is furnished by grasses, almost all of which are eaten by them when fresh and green. Besides the supplies which they receive of all the kinds of corn cultivated for human food, they are also, to a considerable extent, dependent on the *straw* or dried herbage of the corn-plants for their winter provender; and that of many other grasses, cultivated on this account alone, is converted into *hay* for their use. Hay, being cut and rapidly dried whilst the plant is still full of sap, contains more nutritious matter than the ripened straw of the cereals. The most important fodder grass of Britain is RYE GRASS, next to which must be ranked TIMOTHY GRASS; but all the meadow grasses and larger pasture grasses also contribute to the supply of hay.

Next to the grasses must be ranked different kinds of *Leguminosæ*, affording food for cattle in their seeds—as beans, pease, lentils, lupines, &c.—and in their herbage, on account of which many of them are cultivated, as clover, medick, melilot vetch, tare, sainfoin, &c., of some of which there

rous species. Some of these also often
tty largely into the composition of hay,
and dried with the grasses along with
y have been sown; which is the case also
e plants of other orders, as the Ribwort
&c. Some of the *Cruciferæ* are cultivated
siderable extent as forage-plants, cattle
on their green herbage, although they
suitable for drying as fodder. Among

TUS, the term applied in Medicine to the
an embryo, especially in its more advanced
n the human subject, we usually speak of
yo at and after the end of the fourth month
.

are several points in relation to the fœtus
of great interest both to the physiologist
e medical jurist. It is frequently of great
e in medico-legal inquiries to be able to
the *age* of the fœtus; and to facilitate
rmination, the physical characters which it
presents at different ages have been carefully noted
and described.

In the fœtus of nine months—the full term—the length is from 17 to 21 inches; weight from 5 to 9 lb., the average being about 6¼ lb. Even at birth, the average length and weight of the male infant slightly exceeds that of the female. From numerous observations made by Quetelet, it appears that there is an average excess of length of 4·8 lines, and of weight of twelve ounces, in the male infant.

The average weight of infants, without regard to sex, was found by a French observer, Chaussier (who noted the weight in more than 20,000 cases), to be about 6·7 lb.—the maximum being 11·3, and the minimum 3·2 lb. From the inquiries of Dr Joseph Clark (*Philosophical Transactions*, vol. 76), which were made on 60 males and 60 females, the average in this country seems rather higher, the weight of males being 7 lb. 6 oz., and that of the females being nearly 6 lb. 12 oz.; and Professor Simpson has arrived at very nearly the same result. Clark observes that if, at the full time, the weight of the infant is less than 5 lb., it rarely thrives. Various instances are recorded of infants in which the weight at birth has exceeded twice the average weight. Thus a case is recorded by Mr Owen, in the *Lancet* for 1838, in which the child at delivery weighed 17 lb. 12 oz., and was 24 inches in length; and in the *Medico-Chir. Review*, October 1841, there is the mention of a case in which the weight was nearly 18 lb.

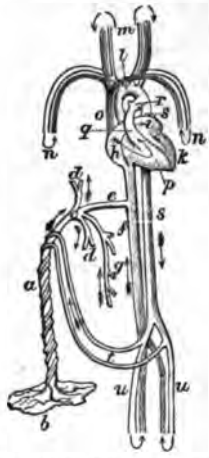
There are certain points in which the fœtus at the full period differs anatomically from the child shortly after birth. The bony skeleton is very incomplete, cartilage occurring in the place of many bones. Indeed, complete ossification (viz., of the vertebræ) is not finished until about the 25th year, and the only bones completely ossified at birth are the minute ossicles of the ear. The difference between the fœtus and the child in this respect is, however, only one of degree.

During pregnancy, a temporary organ, termed the placenta (popularly known as the after-birth, from its being thrown off shortly after the birth of the child), is developed on the inner wall of the uterus (see *b* in the figure). This organ is mainly composed of vessels, and there proceeds from it the structure known as the umbilical cord, *a*, in which lie the umbilical vein, which conveys arterial blood to the fœtus, and the two umbilical arteries, which return the blood to the placenta. This umbilical cord conveys these vessels to the umbilicus, or navel. Before tracing the course of the blood through the fœtus, we must notice the chief anatomical peculiarities presented by the vascular or circulating system before birth.

1. In the heart, we find a communication between the two auricles by means of an opening termed the *foramen ovale*. 2. In the arterial system, we have to notice first, the *ductus arteriosus* (see *r* in the figure), which is a large communicating trunk between the pulmonary artery and the descending aorta; and, secondly, the branches given off by the internal iliac arteries, which go under the name of hypogastric as long as they are within the body of the fœtus, and of umbilical when they enter into the structure of the cord, are continued from the fœtus to the placenta, to which they return the blood which has circulated in the fœtal system. 3. In the venous system there is a communication between the umbilical vein and the inferior vena cava, called the *ductus venosus*.

Pure blood is brought from the placenta by the umbilical vein, which passes through the umbilicus, and enters the liver, where it divides into several branches, *d*, *d*, which are distributed to that

viscus, the main trunk or *ductus venosus*, *e*, passing directly backwards, and entering the inferior vena cava, *f*. The pure blood here becomes mixed with the impure blood which is returned from the lower extremities and abdominal viscera, and is carried into the right auricle, *h*, and from thence, guided by the Eustachian valve (which is situated between the anterior margin of the inferior cava, and the



The Fœtal Circulation (from Wilson's *Anatomist's Vade Mecum*):

a, the umbilical cord proceeding from *b*, the placenta; *c*, the umbilical vein; *d*, *d*, its branches going to the liver; *e*, the *ductus venosus*; *f*, the inferior vena cava; *g*, the portal vein; *h*, the right auricle. The uppermost arrow indicates the course of the blood through the *foramen ovale*. *i*, the left auricle; *k*, the left ventricle. The arrow commencing in the left ventricle, and with its head on the ascending aorta, indicates the course of the blood to be distributed to the head and extremities; *l*, the arch of the aorta. The arrows *m* and *n* represent the return of the blood from the head and upper extremities, through the jugular and subclavian veins, to the superior vena cava, *o*, to the right auricle, *p*, and, as shewn by the arrow, through the right ventricle, *k*, to the pulmonary artery, *q*; *r*, the *ductus arteriosus*; *s*, *s*, the descending aorta; *t*, the hypogastric or umbilical arteries; *u*, *u*, the external iliac arteries.

auriculo-ventricular orifice, and is of relatively large size in the fœtus), passes through the *foramen ovale*, into the left auricle, *i*. From the left auricle, it passes into the left ventricle, and into the aorta, whence it is distributed by the carotid and subclavian arteries principally to the head and upper extremities, which thus receive comparatively pure blood. From the head and arms, the impure blood is returned by the superior vena cava to the right auricle; from the right auricle, it is propelled, as in the adult, into the right ventricle; and from the right ventricle, into the pulmonary artery. In the adult, it would now pass through the lungs, and be oxygenised; but in the fœtus, it passes through the *ductus arteriosus* into the commencement of the descending aorta, where it mixes with that portion of the pure blood which is not sent through the carotid and subclavian arteries. Some of this mixed blood is distributed by the external iliac arteries, *u*, *u*, to the lower extremities, while the remainder (probably the larger portion) is conveyed by the hypogastric or umbilical arteries, *t*, to the placenta.

From the above description we perceive—1. That a considerable quantity of the pure blood from the placenta is at once distributed to the liver, which accounts for its large size at birth as compared with the other viscera. 2. That a double current meets in the right auricle, one stream, guided by the Eustachian valve, passing through the *foramen ovale* into the left auricle, the other through the auriculo-ventricular opening into the right ventricle. 3. That the comparatively pure blood sent to the head and arms, as contrasted with the impure blood sent to the lower extremities, causes the relatively greater development of the former organs, and prepares them for the functions they are called upon to perform; the development of the legs at birth being slight as compared with that of the head or arms.

Almost immediately after birth, the *foramen ovale* becomes closed by a membranous layer, and the *ductus arteriosus* and *ductus venosus* degenerate into impervious fibrous cords.

The lungs, previously to the act of inspiration, are dense and solid in structure, and of a deep-red colour, and lie far back in the chest. Their specific gravity is greater than water, in which they (or portions of them) consequently sink, whereas lungs, or portions of lungs, that have respired, float in that fluid.

In the preceding remarks, we mentioned *nine months* as the full period of fœtal existence. The period of gestation is, however, only constant between certain limits, and it is of the greatest importance in reference to questions of chastity and legitimacy to determine these limits.

The average duration of gestation in the human female is comprised between the 38th and 40th weeks after conception. It is comparatively seldom that the actual date of conception can be fixed with positive certainty; but amongst the few cases of this kind on record, Rigby mentions one in which natural labour came on in 260 days, and Reid mentions another in which it did not commence until the lapse of 293 days. Here, then, we have an unquestionable range of 33 days; and many apparently authentic cases are on record in which a longer period of gestation than in Reid's case has been observed.

Another important question in connection with this subject, is—What is the earliest period at which a child can be born, to enable it to live, and to continue in life after its birth? There is no doubt that children born at the seventh month of gestation are capable of living, although they usually require much care; and children may be born alive at any period between the sixth and seventh months, or even in some instances earlier than the sixth; but this is rare, and if born living, they commonly die soon after birth. Various cases of this nature are collected by Dr Taylor in his *Medical Jurisprudence;* amongst others, he mentions a case reported by Dr Barker of Dumfries, in which a child was born at the 158th day of gestation, and (though small) grew up. In the celebrated Kinghorn case, the child was born 174 days, or nearly six calendar months after marriage, and lived for more than eight months; and the majority of the medical witnesses who gave evidence on that occasion were strongly in favour of the view that the period of the gestation was circumscribed by the period of wedlock.

Again, questions connected with prolonged gestation have given rise to much discussion in legal medicine. No period has been fixed by law beyond which a child if born in wedlock is to be declared illegitimate. In the case of Anderton *v.* Gibbs, 1834, the vice-chancellor decided that a child born ten months or about forty-two weeks after intercourse with the husband, was legitimate. In the Gardner Peerage case, which came before the House of Lords in 1825, the question was, whether a child born 311 days (or 44 weeks and 3 days) after intercourse could be legitimate. Lord and Lady Gardner separated on the 30th of January 1802, and did not again meet till the 11th of July. A full-sized child was

he 8th of December of that year. The obstetric practitioners in the kingdom were on this point, and a large majority con- the opinion that natural gestation might ted to such a period. The decision, which ist the legitimacy, seems to have been not entirely based on the moral grounds Gardner, after separating from her hus- living in open adultery. In the case of ealth *v.* Porter (see *American Journal of cience*, 1845), it was recently decided in d States that a child born 317 days (or weeks and two days) after conception was . In the case of Cotterall *v.* Cotterall, the Consistory Court in 1847, the hus- proceeded against his wife for a divorce und of adultery. In this case, if it were of the husband, it must have been born lve months' gestation. Dr Lushington, ntering into the question of protracted at once pronounced for the divorce, such of pregnancy not being supported by any ts.

ticle would be imperfect without a notice stion—What constitutes live-birth? This on which the most distinguished obstetric s have differed: some holding that where nuscular movement, there is life; while intain that where respiration has not ed to have taken place, the child was

Amongst the most celebrated lawsuits this point, we may mention that of Fish , tried in 1806, and that of Brook *v.* ried in 1861. In the last-named case it ed by the Vice-Chancellor, Sir J. Stuart, ld may live for some time after birth, and e, the absence of signs of breathing being no proof of its being born dead. It was evidence that there was pulsation of the r separation of the cord, and the beating art was regarded as proof of live-birth. may regard it as now established in aw, that respiration is not required to live-birth. Nor do the laws of France ited States require that the child shall thed. In Scotland, the law requires not the child shall have breathed, but that it cried; and in conformity with this law, hich lived, breathed, and died in convul- he end of half an hour, was declared to born dead (Dyer's *Reports*, 25).

or MIST, is the visible watery vapour hanging near the surface of the earth, d, as clouds are, by the precipitation of ure of the atmosphere. This takes place stratum of atmosphere comes in contact older stratum, or with a portion of the rface, as a hill, by which it is cooled, so an no longer hold in solution as much as before. It takes place also when a cold f atmosphere comes above a moist warm the earth's surface, the exhalations from precipitated and become visible as they o it. Thus, fogs are formed over lakes, d marshes in the evening, because the hen warmer than the atmosphere above fogs seen in the morning very often dis- being dissolved in the atmosphere as the re increases.

RASY, JÁNOS (John), a Hungarian philolo- risconsult, was born in 1801 at Käsmárk, nty of Abanj. F. went through the study phy and law at the Calvinistic college tak, and was called to the bar in 1829. ering the judicial career, F. divided his exertions between law and the national or Magyar language, with such success that he was elected Fellow of the Hungarian Academy in 1838. F.'s several publications in the fields of Hungarian jurisprudence and philology are reckoned to be standard works, bearing the stamp of deep original research, and of great systematic powers. The following list of works, all published at Pesth, in the Hungarian or Magyar tongue, may shew the fertility of F.'s pen: *Latin-Magyar Lexicon for Legislation and Government* (2d ed. 1835); *The Metaphysics of the Magyar Tongue* (1834); *Magyar-German Dictionary* (1836); *Elements of Hungarian Statute Law* (1839), with a valuable Appendix published at a later date; *The Commercial Law of Hungary* (1840); *Hungarian Bank* (1848); and *Commercial Dictionary*. F. has also contributed much, by his *Essays on the Spirit of the Hungarian Language* (1845), towards its rapid development. He is at present busily engaged (together with Czuczor) in preparing the great dictionary of the Hungarian Academy.

FOGGIA, an important town of Italy, capital of the province of Capitanata, in Southern Italy, is situated between the rivers Cervaro and Celone, in a district abounding in plantations of olives, vines, and other fruit trees, 80 miles east-north-east of Naples. It is a handsome, well-built town, with spacious streets, good houses, and large shops. Among the chief buildings are the cathedral, a Gothic edifice originally, but partially destroyed by an earthquake in 1731, and afterwards rebuilt in a different style; numerous churches, some of them antique; the custom-house, a beautiful building; and the theatre. It is the centre of all the trade of the province, and has many large corn magazines. Pop. 24,000.

F., supposed to have been built from the ruins of the ancient Arpi, was a favourite residence of the Emperor Frederick II., and here died his wife, Isabella, daughter of the English king, John. It was also for some time the residence of Ferdinand I. and his court, when it ranked as the second city in the kingdom.

FOG-SIGNALS, audible warnings used on board ships, on the sea-coast, or on railways, during fogs and mists, or at any other time when lights or ordinary daylight-signals are not available.

The commonest fog-signal on shipboard is the continuous ringing of the ordinary time-bell, or striking the anchor with a hammer, together with the occasional discharge of musketry and heavy guns. These are adopted, to prevent collisions, when ships are overtaken by a fog in the British Channel, or other places where shipping is abundant. The blowing of a horn, the beating of a drum, an empty cask, a gong, and various other unusual sounds, are also adopted. Steam-vessels generally blow a whistle under these circumstances. These sounds, however, only indicate rudely the position of the ship, and not the direction in which she is sailing. Many plans have been devised for a code of signals, by which the directions north, south, &c., might be indicated by the varying length of each sound, or the intervals between the sounds of a fog-horn or whistle.

It is very desirable that some general code of signals of this kind should be adopted for the merchant service as well as the navy; and that its recognition by the marine of all other nations should be procured. The Admiralty have such a code for the direction of a fleet of ships of war in thick weather, but their application is limited to the navy. Some further remarks on fog-signals will appear under SIGNALS (q. v.).

Fog-signals from the shore are very desirable,

especially on a dangerous coast. The ringing of church-bells, and of bells at the coast-guard stations, has been suggested; but there is one serious difficulty here, viz., that when most needed, that is, when a strong wind is blowing in towards the shore, such sounds would be heard only at a very little distance out at sea.

The fog-signals used on railways are small cases charged with detonating powder, and laid upon the rails. They explode loudly when the wheel of an advancing train comes upon them. They are not merely used in fogs, but in all cases of danger, from obstruction of the line, or in other cases of urgency when a train has to be stopped without delay. Station-masters and railway police are furnished with them for the purpose of thus stopping a train at any place.

FOHI. See FUH-HI.

FOHR, one of the greater Danish islands in the North Sea, on the western coast of the province of Slesvig; its central point is in lat. 54° 42′ N., and in long. 8° 30′ E. It has an area of about 28 square miles, has upwards of 5000 inhabitants, is divided into *Westerlandfohr*, which belongs to the province of Jutland, and *Osterlandfohr*, which belongs to that of Slesvig. The inhabitants are mostly Frisians, who live by taking fish and wild fowl, and by the manufacture of cheese and stocking-ware. The chief place is a bathing-place, called Wyk, with a population of 700.

FOIL, a thin bar of elastic steel, mounted as a Rapier (q. v.), but without a point, and additionally blunted at the end by the presence of a button covered with leather. It is used in Fencing (q. v.).

FOIL (from *folium*, a leaf), a general name for thin metal intermediate in thickness between *leaf-metal*, such as gold, silver, and copper leaf, and *sheet-metal*.

There are two distinct kinds of foil in common use—the tin-foil used for silvering looking-glasses, lining tea-caddies, and other similar purposes, and for the conducting coatings of electrical apparatus; and the bright foils employed by the jewellers for backing real or artificial gems, and thereby increasing their lustre or modifying their colour.

The former is made by rolling out tin, or more recently, by the method of Mr Wimshurst, who casts a cylinder of the metal, and then, by means of a knife or cutter, shaves it into a sheet as the cylinder rolls to the knife, which is gradually moved inwards towards the axis of the cylinder at a rate proportionate to the required thickness of the sheet.

The bright foil used by jewellers and for theatrical and other ornaments under the name of 'tinsel,' is made of copper, tin, tinned copper, or silvered copper. The last is now chiefly used by jewellers. The metal is rolled in a flatting mill, and the requisite brilliancy of surface is produced by finishing between burnished rollers and polishing. The various colours are produced by coating the white metal with transparent colours mixed in isinglass size. A similar varnish without colour is laid over the white foil, to prevent tarnishing. The socket or setting in which the stone or paste is mounted is lined with the foil, and by reflecting from the internal facets the light which passes through the stone, adds considerably to its brilliancy. The natural colours of real stones are sometimes heightened or modified by coloured foil, and factitious colours are thus given to the glass or 'paste,' as it is called, of which spurious gems are made.

There are two other methods of foiling gems, distinct from the above: one of them is to line the socket of the setting with tin-foil, then fill it whilst warm with mercury; after a few minutes, the fluid mercury is poured out, and there remains an amalgam of tin, precisely the same as is used for backing common mirrors; the gem is fitted into this, and thus its back has a mirror surface. The other method is to precipitate a film of pure metallic silver upon the back of the stone, by submitting a solution of the ammonia nitrate of silver in contact with the stone to the reducing action of the oils of cassia and cloves. The silvering of looking-glasses being the chief use to which the ordinary *tin-foil* is applied, its purity is a matter of great consideration; its employment also by chemists, as a ready means of forming some of the tin compounds, renders this absolutely necessary.

Nevertheless, the spirit of adulteration has extended to the tin-foil makers, and lead has been extensively alloyed with the tin. In some analyses recently made, it has been shewn that as much as 85 per cent. of the adulterant metal has been used, the effect of which in the process of silvering mirrors is most injurious to the brilliancy of the amalgam, which should consist of perfectly pure tin and quicksilver. For chemical purposes, it is now absolutely necessary to test for lead before using *tin-foil*.

The foils used by jewellers for backing gems, consisting of small sheets of silvered copper rolled very thin, are coloured with the following preparations, to suit the different gems under which they are to be placed, or for use as tinsel in the manufacture of theatrical ornaments, toys, &c. Lake and Prussian blue, and pale drying-oil finely ground with a slab and mullar—for *amethyst* colour. Prussian blue, similarly prepared—for *sapphire* colour. Dragons' blood dissolved in pure alcohol—for *garnet* colour. Sesquiferrocyanide of iron and bichromate of potash, equal parts very finely ground and sifted, then ground with a quantity of gum-mastic equal to the other two ingredients, until the whole forms an impalpable powder; gradually form this into a thin paste with pure wood-spirit (pyroxylic) and preserve in stoppered bottle; when used, a portion is diluted with wood-spirit to the necessary thinness—for *emerald* colour. *Various shades of yellowish or bluish green can be produced by varying the proportions of the two colouring materials.* Lake or carmine ground in solution of isinglass—for *ruby* colour. A weak solution of orange shell-lac, sometimes tinted with saffron, turmeric, or aloes—for *topaz* colour. Several other colour-varnishes are made by similar methods for various shades of tinsel and gem foils. See SILVERING.

FOIX, a small and unimportant town of France, in the department of Ariège, and on the left bank of the river of that name, 44 miles south-south-east of Toulouse. It has a picturesque old castle, with three well-preserved towers of whitish marble, all of different ages, and all dating from before the 15th century. It has some trade in iron, and in the vicinity are numerous ironworks. Pop. 5260. F. was capital of the old county of *Foix*.

FOIX, an old French family, which took the title of count from the district of Foix (now the department of Ariège), in the south of France. The first who bore the title was Roger, Comte de Foix, who flourished in the middle of the 11th century. Raymond, Comte de Foix, figures as one of the knights who accompanied King Philippe Auguste to Palestine; afterwards, being accused of heresy, his estates were seized by Comte de Montfort. He died in 1223. Several members of the family subsequently distinguished themselves in the wars against England. Gaston III., Comte de Foix, born 1331, and called, on account of the beauty of his person, Phœbus, was noted for his knightly love of

and military prowess. For his services
ag, he was made governor of Languedoc
ony. When only 18, he married Agnes,
of Philip III., king of Navarre. In 1358,
e insurrection known as the *Jacquerie*
delivered the royal family from the
the rebels. When Charles VI. wished to
im of the government of Languedoc, he
d his position by force of arms, and
he Duc de Berri in the plain of Revel. He
inately attached to the chase, and is said
ept 1600 dogs. He also wrote a work on
t, entitled *Miroir de Phébus des deduitz*
ne des Bestes sauvaiges et des Oyseaulx de
ich went through several editions in the
17th centuries, and whose bombastic style
Phébus) became a byword. Froissart
e of the choicest incidents in his history
lived for some time in the castle of
aston's principal residence. After his
1391, the estates and title went to a
branch of the family. Gaston IV., Comte
endered good service to the king in the
nst England. In 1455, his father-in-law,
king of Navarre, named him his successor.
on to this, Charles VII. created him a
ance, and ceded to him his claims upon
and Cerdagne. He died in 1472, when
possessions were again divided. The
grandson, Gaston de Foix, was probably
heroic member of the family. Son of
Foix, Comte d'Estampes, and Marie
sister of Louis XII. of France, he was
89, and in 1507 received from his uncle,
king, the title of Duc de Nemours. In
wars carried on by Louis, Gaston dis-
e most brilliant and precocious genius.
overthrew the Swiss, at Como and Milan;
pe Julius II. from Bologna; seized Brescia
hands of the Venetians; and, to crown a
splendid triumphs, which obtained for him
the *Thunderbolt of Italy*, won the great
Ravenna over the Spaniards, 11th April
which, however, he fell, at the early age
-three. On his death, the estates and
e House of Foix went to Henri, king of
whose daughter, Jeanne d'Albret, married
Bourbon, Duc de Vendôme, and became
r of the great Henri Quatre, who thus
he county of Foix to the French crown.

LAND, or FOLKLAND, the land of the
ople in England in Anglo-Saxon times.
nd, according to Turner, was that portion
global which was retained in behalf of the
l with a view to increasing population and
g wants of the community, and not per-
become allodial estate or absolute private

Of this land, the usufruct or *dominium*
enjoyed by the freemen, for which certain
paid to the state, and which did not
ereditary. On the contrary, the rights
ve held in it by individuals reverted to
unity at the expiry of a particular term,
as again given out by the folegemot or
the district, either in commonty or in

Certain services to the public were
imposed on the holders of folcland, such
uration of the royal vills and other public
e exercise of hospitality to the king, and
ersonages of distinction in their progresses
ne country, by furnishing them and their
, huntsmen, hounds, hawks, and horses
, and providing them, when necessary,
ns of transport. It does not seem that
nd was held exclusively by the common
t rather that it was open to freemen
of all ranks and conditions, and that the possession of it was much coveted even by those who held great estates on the hereditary title which was known as *Bockland* (q. v.). Folcland was often given out as bockland to those who had performed great public services, just as Horatius was rewarded by a grant of the Roman *ager publicus*—

> 'They gave him of the corn-land
> That was of public right,
> As much as two strong oxen
> Could plough from morn till night!'

It was also frequently given to the church, for the purpose of founding monasteries and the like, a practice of which Bede complains in his celebrated letter to Archbishop Egbert. 'It is disgraceful to say, persons who have not the least claim to the monastic character, as you yourself best know, have got so many of these spots into their power, under the name of monasteries, that there is really now no place at all where the sons of nobles or veteran soldiers can receive a grant.'—Kemble's *Saxons*, p. 291. Kemble gives examples of the dues paid by monasteries for the folcland which they held, which afford curious information as to the products of industry and modes of living of those times. In 883, a monastery is freed from all dues which the monks were still bound to pay to the king's hand, including bright ale, beer, honey, oxen, swine, and sheep. The dues of the monastery at Taunton were—a feorm (or entertainment) of one night to the king, and eight dogs and one dog-keeper; and nine nights' keep for the king's falconers, and carriage, with wagons and horses, for whatever he would have taken to Curry or Wilton; and if strangers came from other parts, they were to have guidance to the nearest royal vill upon their road.—*Ib.* 295, 296.

FÖLDVAR, a town of Hungary, in the county of Tolna, is situated on the crest and slope of a hill on the right bank of the Danube, 48 miles south of Pesth. It has a Roman Catholic high school, is a steam-boat station, has an important sturgeon-fishery, and considerable trade in wines and agricultural produce. Pop. 11,800.

FOLIA MALABA'THRI, i. e., Malabar Leaves, formerly in much repute as a medicine; an aromatic tonic; the dried leaves of *Cinnamomum nitidum*, and partly of *C. Tamala*, species of cinnamon, small Indian trees or shrubs.

FOLIA'TION, a term restricted by Mr Darwin, and subsequently by geologists, to the alternating layers or plates of different mineralogical nature, of which gneiss and some other metamorphic schists are composed. It differs from cleavage, which is applied to the divisional planes that render a rock fissile, although it may appear to the eye quite or nearly homogeneous; and from lamination, which is the easy splitting of a rock into its original layers of deposition. It is difficult to determine the cause of foliation. Some hold that as gneiss is composed of the disintegrated ingredients of granite, the layers are identical with the original laminæ, having been arranged according to their various densities. But it can scarcely be conceived that water would be able to deposit such materials in the same order over areas so immense as those occupied by gneiss strata. It seems more probable that the arrangement is owing to some widespread metamorphic and segregating force, which operated subsequently to the deposition of the beds.

FOLI'GNO, a town of Central Italy, in the province of Perugia, in the fruitful valley of the Topino, 18 miles north of Spoleto. It was formerly surrounded by walls, which, however, have been

converted into promenades. It has regular streets, and some important buildings, including the beautiful cathedral, the theatre, the Palazzo Communale, the hospital, and several churches. Raphael's Madonna di Foligno, now in the Vatican, formerly hung in a convent here. The manufactures are woollens, paper, and wax-candles. Pop. 8100.

F., the ancient Umbrian *Fulginium*, was called in the middle ages Fulignum. In 1832 it suffered severely from an earthquake.

FOLKES, MARTIN, LL.D., an eminent English scholar and antiquary, born at Westminster in 1690, was educated at Clare Hall, Cambridge. In 1713, he was chosen a fellow of the Royal Society of London; and in 1741 he succeeded Sir Hans Sloane as president of that learned body. He was also a member of the Antiquarian Society, and of the Royal Academy of Sciences at Paris. He died in 1754. F. was the author of *A Table of English Gold Coins from the 18th Edward III., when Gold was first coined in England* (Lond. 1736, 4to), with *A Table of English Silver Coins, from the Norman Conquest; to which is added an Appendix, answering the Coins minted in Scotland since the Union of the two Crowns* (Lond. 1745, folio), published under the care of the Antiquarian Society, superintended by Dr Giffard (1763, 2 vols.). Besides these works, F. contributed a number of papers to the *Philosophical Transactions*.

FOLK-LORE, a term recently introduced into English from the German, as applicable to what may be called a department of antiquities or archæology—viz., that which relates to ancient observances and customs, and also ideas, prejudices, and superstitions among the common people. In England, the literature of this subject may be said to have commenced with the *Miscellanies* of John Aubrey, published in 1696, in which we find chapters on Day Fatality, Omens, Dreams, Corpse Candles, Second Sight, and kindred matters, to which that learned but credulous author—an early member of the Royal Society—had given his attention. Here, however, the superstitions, rather than the ordinary observances and customs of the people, were detailed. The first book addressed to the general subject of folk-lore was an octavo volume by the Rev. Henry Bourne, published at Newcastle in 1725, under the title of *Antiquitates Vulgares, or the Antiquities of the Common People*. It mainly consists of an account of the popular customs in connection with the feasts of the church. Fifty years after its publication, John Brand, M.A., a native of Newcastle, busied himself in extending the collections which originated with Bourne, and in 1777 he published at that city the first edition of his *Observations on the Popular Antiquities of Great Britain*, a work which was subsequently enlarged by himself, partly from the stores of folk-lore presented in the *Statistical Account of Scotland* (edited by Sinclair, 1791—1795), but was left to be re-issued, under a thoroughly revised form, in 1813 (2 vols. 4to), by Henry Ellis of the British Museum. This work, in which Bourne's was incorporated, has since been twice reprinted, with additions, and might have been regarded as an exhaustive work on the subject, if it had not been shewn by Hone's *Every Day Book* and *Year Book*, and the useful little periodical entitled *Notes and Queries*, that, after all, many curious particulars of English folk-lore remained to be gleaned. Through all these various channels, we now have tolerably ample information on popular festivals of every kind, both those which appear to have originated in pagan times, and those instituted by the Christian Church, on all observances connected with the important movements of domestic life, as marriages, sepulture, &c.; on fireside amusements, on superstitions and vulgar errors. What may be called a sub-section of folk-lore has at the same time been amply illustrated in the *Nursery Rhymes*, edited by J. O. Halliwell, and the *Popular Rhymes of Scotland*, edited by Robert Chambers. It is to be observed that, while folk-lore has thus been engaging the attention of literary men, and put beyond risk of oblivion by taking its place in solid books, it is everywhere declining among the people themselves. To this effect, the diffusion of scientific ideas, the disfavour of the clergy for everything connected with the supernatural except religion itself, and the great industrial changes and improvements of the last fifty years, including a greatly increased shifting of the people from one district to another, have all conduced. In the British Islands, no effort has been made to generalise folk-lore for any purpose connected with anthropology, ethnology, or any other science; but in Germany, as is well known, the learned brothers, Jacob and Wilhelm Grimm, have turned the ancient simple usages and traditions of the peasant's fireside to excellent account in illustrating remote periods of the national history.

FOLKMOTE (a meeting or assembly of the 'folk' or people) was the term applied by the Saxons to district meetings generally, though Kemble is of opinion that originally it was the great meeting of the nation, which was afterwards converted into the Witenagemôte, or meeting of the councillors or representatives of the nation (Kemble's *Saxons in England*, ii. p. 194).

FOLKRIGHT, mentioned in the laws of King Edward the Elder, is nearly synonymous with the common law, or rather with the rights which the common law confers on the people of England.

FO'LKSTONE, a rising town of England on the south-east coast of Kent, is a municipal borough, seaport, and bathing-place, and is situated 83 miles east-south-east of London by rail, and five miles west-south-west of Dover. It stands on uneven ground at the foot of a range of hills. The oldest part lies in a narrow valley, crossed by a magnificent railway viaduct. It has rapidly extended and improved since the opening of the South-eastern Railway, and the establishment of steam-packets from this town to Boulogne, 30 miles to the south-east. Between the two places is a submarine chain of rocks only 14 fathoms under low water. Pop. (1861) 8528. F. unites with Hythe in returning one member to parliament. In 1860, 1550 vessels, of 226,051 tons, entered and cleared the harbour. The view from the pier extends from Shakspeare Cliff, at Dover, to Fairlight Head, at Hastings; the Boulogne heights are also seen. On a hill in the vicinity are the remains of Roman intrenchments. Here Harvey, the discoverer of the circulation of the blood, was born.

FOMENTATION (Lat. *fomentatio*; also *fotus*, from *foveō*, I bathe), an application of warmth and moisture to a part, by means of cloths wrung out of hot water, sometimes medicated with vegetable infusions of substances calculated to relieve pain or stimulate the surface. Thus, opium, belladonna, chamomile, turpentine, &c., are used in various forms in connection with fomentations, which are of very great service in the treatment of almost all painful local disorders.

FONBLANQUE, ALBANY, journalist, born in 1797, was intended for the bar, and became a pupil of Chitty, the eminent special pleader. Castlereagh's Six Acts made him a political writer. As editor of the *Examiner*, the then leading Liberal weekly journal, F. exhibited a singular keenness both of wit and intellect, and exercised no inconsiderable

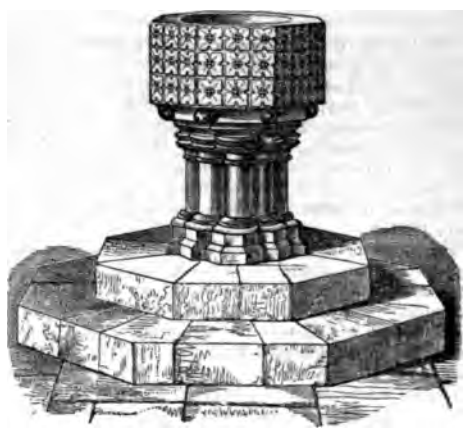
n on public opinion between the years d 1836. Leigh Hunt, who was his pre- in the editorship of the *Examiner*, says of his Autobiography, 'He was the genuine r not of me, but of the Swifts and Addisons res; profuse of wit even beyond them, and in political knowledge.' The characteristics olitical writings may be gathered from his titled *England under Seven Administrations* which is simply a reprint of the more l leading articles published in the *Examiner* e period of the Canning and Goderich s, to the return of the Melbourne ministry. rices to the Whigs were rewarded by his nent to the office of secretary to the al Department of the Board of Trade in his post, which he still holds (1862), does understood, interfere with his occasional tions to the journal with which his name so long associated.

D DU LAC is a name of various application ortion of the United States which originally to French Canada. Primarily denoting the tremity of any great body of fresh water, econdarily, been made to indicate adjacent of different kinds, chiefly in connection ke Superior, the grand reservoir of the St e, and Lake Winnebago, which empties itself e westward into Lake Michigan.—1. The Lac of Lake Superior has lent its appella- village in Minnesota, situated at a distance 20 miles, on its navigable tributary, the .—2. The Fond du Lac of Lake Winnebago s both a county and town of Wisconsin. er has sprung up mainly since 1845, has a situation on a wooded slope above the important trade in grain, provisions, and a great number of Artesian wells, and a on in 1859 of about 8000.

DI (anciently, Fundi), a small town of the north-west of the province of Terra o, is situated six miles from the coast, on ian Way, which now forms its principal 6 miles north-west of Naples. It is an dirty, and miserable town, in the neigh- l of a pestiferous lake (the ancient *Lacus s*); the surrounding plain, however (the *Cæcubus Ager*, which produced the famous wine of classic times), is very fruitful. F. nded in part by walls of cyclopean struc- l has a population of 5700, who are said the highest degree wild and lawless.

ECA, a bay on the Pacific coast of Central lies between the two states San Salvador ragua. It claims notice principally as the terminus of an interoceanic railway from rto Caballos in Honduras. The inter- ountry has been surveyed, and reported as le.

T (*Fons Baptismalis*), the vessel used in as the repository of the baptismal water. early period, while immersion continued e ordinary rite of the administration of ament of baptism, the baptistery (see RY), or other place set apart for the , was furnished with a basin sufficiently to admit of the administration of the rding to the then prevailing form. But became customary to baptize by affusion— by pouring the water on the head of the o be baptized—the size of the basin was diminished, and eventually it assumed ensions and the form which are now to us in most of the medieval churches Britain and upon the continent. The baptismal font, in its normal form, consists of a basin or cup, more or less capacious, hollowed out of a solid block, and supported upon a stem or pedestal. It is ordinarily of stone, but some ancient examples of leaden fonts also occur, and a few of copper or of bronze. In general, how ever, it may be said that the font, in its externa form and character, followed the prevailing style of ecclesiastical architecture and ornamentation. From its connection with one of the most solemn rites of religion, it became very early a favourite subject for the exercise of the decorative skill of the artist, and there are still preserved in different churches fonts which exhibit characteristics of each and all the successive fashions through which church architecture has passed since the introduction of the font in its present form. There is some doubt as to whether any existing specimen in England really belongs to the Saxon period, but examples are found of all the later styles, from the Early Norman down to the latest revival of Gothic architecture in our own day; the Early English, the Decorated, of which a beautiful example occurs in the church of All Saints, Norwich; and the Perpendicular, which is seen in its highest perfection at East Dereham in the same county of Norfolk. The annexed engraving exhibits a highly characteristic



Font.

specimen of the fonts of the beginning of the 14th c., which stands in the church of Swaton, Lincolnshire, erected about 1310.

The external figure of the basin seems to have been originally circular or elliptical; but most of the later fonts are hexagonal, or even eight-sided. The basin was commonly supported on a single pillar or stem. Many cases, however, occur in which it rests on three, four, or five pillars, or, as in the engraving, on a group of pillars or pilasters united into a solid stem. The exterior, as well of the basin as of the pedestal, was often highly decorated, ordinarily with sculpture, but occasionally also in gold and colours; the designs on the basin commonly representing subjects connected with baptism, or its types and symbols. We frequently meet around the pedestal figures of the apostles, sometimes only eleven in number, Judas being omitted.

In the Roman Catholic Church, the service of Easter Saturday contains a solemn form for the blessing of the baptismal font. After a long series of prayers, and amid a very imposing ceremonial, the 'chrism,' or consecrated oil blessed by the bishop, and also the so-called 'oil of catechumens,' are

mingled with the baptismal water, which is reserved for subsequent use. With a view to the preservation of the water thus reserved, the font, especially when it is of porous stone, is sometimes lined with lead; and from an early date, it is furnished with a lid, which is secured by a lock, and is often of a highly ornamental character.

The ordinary place of the font is at the western end of the nave, near the entrance of the church, but in many cases it stands in a separate chapel or baptistery, or at least in a compartment screened off for the purpose. Even when it stands in the open nave, it is properly enclosed by a rail.

The baptismal font is not to be confounded with the 'holy-water fount,' which usually stands near the entrance of Roman Catholic churches, and from which persons entering sprinkle their forehead, in recognition of the inward purity with which we ought to enter the house of God; nor with the *piscina* or *sacrarium*, which is found in the chancel or the sacristy of ancient churches, and which was intended to receive and carry away the water used in cleansing the sacred vessels, the altar-linens, and the other furniture used in the administration of the eucharist. See Paley's *Illustrations of Baptismal Fonts;* Simpson's *Series of Baptismal Fonts;* Wetser's *Kirchen-Lexicon;* Binterim's *Denkwürdigkeiten.*

FONTAINEBLEAU, a town in France, in the department of Seine-et-Marne, is beautifully situated in the midst of an extensive forest, near the left bank of the Seine, 35 miles south-east of Paris, with which it is connected both by steamers on the Seine, and by railway. There are several fine public buildings, among others, two hospitals—one erected by Anne of Austria, the other by Madame de Montespan. It furnishes a great deal of wine and fruit for the capital, and has manufactures of porcelain. Its grapes are famed as *Chasselas de Fontainebleau.* Pop. 10,669.

F. is chiefly famous for its château, or pleasure-palace of the kings of France, and the forest that surrounds it. The forest covers an extent of 64 square miles, and presents much fine scenery. The château is said to have originally been founded by Robert the Pious toward the end of the 10th century. It was rebuilt in the 12th c. by Louis VII., of whom, and of Philippe Auguste, it was a favourite residence, and was enlarged by Louis IX. and his successors. After being allowed to fall into decay, it was repaired and embellished by Francis I., who here received the Emperor Charles V. with lavish splendour, in 1539. Almost every succeeding king added something in the way of enlargement or embellishment, so that it bears the character and style of almost every century.

In the 17th c., it was the residence of Christina of Sweden after her abdication, and in the *Galerie des Cerfs* she caused her secretary Monaldeschi to be executed. Under Louis XIV. it was occupied by Madame la Montespan, and under Louis XV. by Du Barry; and here Pope Pius VII. was detained a prisoner for nearly two years by Napoleon. Many state transactions and treaties are dated from F.; among others, the act of abdication of Napoleon in 1814. Louis Philippe had all the paintings renovated, and the apartments restored in the taste of the 16th century.

FONTA'NA, Domenico, an eminent engineer and architect, born in 1543 at Mili, in the vicinity of Lake Como. At the age of twenty he joined his brother, also an architect in Rome, and in a brief period achieved a reputation sufficiently brilliant to attract the notice of the magnificent Cardinal Montalto, to whom he was appointed private architect. The pomp of this cardinal seems to have given umbrage to Pope Gregory XII., who, in consequence, discontinued the cardinal's private pensions, and thus disabled him from completing the splendid works he had intrusted to F.—viz., the Sistina Chapel in Santa Maria Maggiore, and an adjoining palace. In this emergency, the spirited architect, out of his own funds, carried on the noble designs of his patron, on the same scale of magnificence in which they were commenced, and for his disinterested devotion received later ample reward, when the cardinal, under the name of Sixtus V., was called to the papal chair. F., as papal architect, was employed in a variety of important works, amongst which stands conspicuously the wonderful removal and re-erection of the colossal Egyptian obelisk, to be seen now in the piazza of St Peter's. He afterwards erected several other obelisks, and was intrusted by Sixtus with the construction of the Lateran Palace, and of the famous Vatican Library. The restoration of the columns of Trajan and Antoninus, and the construction of the aqueduct known as the *Aqua Felice*, deserve mention amongst the many works of utility executed by Fontana. On the death of his friend and patron, Pope Sixtus, F., through the intrigues of invidious enemies, was stripped of his post as papal architect in 1592, but was immediately proffered a similar appointment in the name of the king of Naples. During his sojourn in Naples, he executed many imposing designs; the royal palace, and a noble promenade along the bay, being amongst the chief. His conception of a grander harbour was carried into effect by others, his death, in 1607, at Naples, preventing his personal superintendence benefiting the undertaking. F.'s son, Giuglio Cesare, heir to his father's great wealth, and some of his genius, was appointed royal architect on his decease.

FONTA'NA, Felice, a celebrated physiologist, born at Pomarolo, in the Italian Tyrol, in 1730. At the termination of an elaborate course of study, carried on in the several universities of Verona, Parma, Padua, and Bologna, he was presented to the chair of philosophy in the university of Pisa by Francis I., Grand Duke of Tuscany. Leopold, on succeeding his father, appointed F. court physiologist, and charged him with the organisation of a museum of natural history and physiology, which to this day is one of the scientific marvels of Florence. It comprises a superb collection of the phenomena of the animal, vegetable, and mineral kingdoms, besides an exquisitely elaborate series of wax models, representing the human body as a whole, and each minute separate organ. A similar collection was executed by F. for the museum of Vienna, by order of the Emperor Joseph II. He died 9th March 1803. F.'s chief writings consist of scientific considerations on the various phenomena of physical irritability, *Ricerche Filosofiche sopra la Fisica Animale* (Florence, 1781), and *Dei Moti dell' Iride* (Lucca, 1765).

FONTANES, Louis, Marquis de, was born 6th March 1757, at Niort, and was sprung from an old Protestant family of Languedoc. After the completion of his studies, he went to Paris, where he acquired a reputation by his poems, *Le Cri de mon Cœur* (Paris, 1778), and *Le Verger* (Paris, 1778), as also by his metrical translation of Pope's *Essay on Man*, and his imitation of Gray's *Elegy written in a Country Churchyard.* During the Revolution, F. conducted various journals in the popular interest. In 1802, he was made a member, and in 1804 president of the legislative body. His admiration of Napoleon was great; and his splendid oratorical talents were often employed in eulogising the emperor's acts. Even when Napoleon was only

F. had irritated the republican party by
ıg of the French people as *sujets* (subjects).
0, he entered the senate. After the fall
oleon, he passed into the service of the
l Bourbons, and was raised to the peerage
is XVIII. He died 17th March 1821. His
writings, prose and poetic, have been
d and edited by Sainte-Beuve (2 vols., Paris,
nd are regarded as models of elegance and
ness.

'TENAY-LE-COMTE, or FONTENAY-
ÈE, a town of France, in the department
dée, is situated in a pleasant valley on the
ank of the Vendée, 27 miles north-east of
chelle. The streets of the older portion
town are narrow and tortuous. Its chief
gs are the beautiful Gothic church of Notre
with a spire 311 feet high; the college, the
, and the fountain from which the town is
have derived its name. F. has linen manu-
s, tanneries, and a trade in timber, and is an
ıt for the victuals and commodities of the
Pop. 7780.

'TENELLE, BERNARD LE BOVIER DE, an
t French author, was born at Rouen, 11th
ry 1657. His father was an advocate, and his
a sister of the great Corneille. He began
dies in the college of the Jesuits at Rouen,
the age of 13, obtained the prize for a Latin
During the next three years he professed
ly law, but in reality busied himself with the
nteresting subjects of history, poetry, and
phy. After passing as an advocate, he com-
l to practise, but lost the first cause which
ducted, and in consequence renounced the
ever. In 1674, he went to Paris, where he
l upon a literary career, and soon attained to
ty and independence. He was a member of
learned societies; and from 1699 to 1741,
ıe office of Secretary of the Académie des
s, but declined the post of president. F.
t Paris 9th January 1757, having nearly
l his 100th year, wittily remarking to his
, as he expired: 'Je ne souffre pas, mes amis;
sens une certaine difficulté d'être' ('I don't
my friends; but I feel a sort of difficulty in
ıny longer'). The greater part of his nume-
retical, historical, oratorical, philosophical,
entific writings, though much admired at the
f their publication, have now fallen into
n. He possessed, however, along with great
representation, a poetical turn of mind, and
te intellect. He wrote a few operas, among
Psyché, *Bellérophon*; a musical and dramatic
l entitled *Endymion*; several tragedies—
, *Aspar*, *Idalie*; comedies, fables, fugitive
epigrams, &c. Of his prose writings, we may
n the *Lettres du Chevalier d'Her*, the *Dia-
des Morts*, in the manner of Lucian; his
ens sur la Pluralité des Mondes, which,
ch much read once, has now become obsolete,
equence of the advancement of science; and
ıtises Sur l'Existence de Dieu, *Sur le Bonheur*,
rigine des Fables; and his *Histoire du Théâtre
is jusqu'à Pierre Corneille*, which is still con-
F. was particularly celebrated for his *bon-*
and for the manner in which he edited the
res de l'Académie des Sciences, and executed
ges. It is also perhaps worth mentioning,
t the age of 92 he still wrote madrigals!
uvres Complètes have been republished several
The most complete edition is that published
s (3 vols. 1818).

'TENOY, a village of Belgium, in the pro-
f Hainaut, 5 miles south-west of Tournay,
with a population of about 800, deserves mention as the scene of the battle of Fontenoy, one of the most famous contests in the war of the Austrian Succession. The battle was fought 11th May 1745 the opposing forces being the French, 60,000 strong under Marshal Saxe, and the allies (English, Dutch, and Austrians), in nearly equal force, under the Duke of Cumberland. After a hard-fought fight, the allies were forced to retreat. The loss on both sides was stated at about 7000 men.

FONTEVRAULT (*Fons Ebraldi*), a small town of France, in the department of Maine-et-Loire, 8 miles south-east of Saumur, with a population of about 830, owes its origin to a wealthy and celebrated abbey, now converted into a prison for eleven departments. This abbey was founded by Robert d'Arbrissel, a Breton monk, in 1099, as the residence of a monastic society composed of penitents of both sexes. This society took the name of the *Order of Fontevrault*. It followed the austere rule of Benedict, but had this peculiarity, that the monks were ruled by an abbess, and not by an abbot. The order of F. soon spread through France, and into Spain, and in the former country especially acquired great riches. The abbesses of F. belonged, for the most part, to illustrious families, and were subject only to the popes. At a later period, the strictness of the monastic discipline was relaxed in favour of the nuns, whence, however, in the 14th c., sprung great disorders. Gradually, the order of F. fell into disrespect, but even at the outbreak of the French Revolution it possessed 57 priories in France, which, however, were then abolished along with the other monasteries. The town is of peculiar interest to Englishmen, from the fact that it contains the cemetery of several of the Plantagenet kings of England and of the counts of Anjou. Of these, however, only the tombs of Henry II., of his queen Eleanor of Guienne, of Cœur-de-Lion, and of Isabelle, the queen of John, have been preserved. The old monastic buildings and courtyards, surrounded by walls, and covering from forty to fifty acres, now form one of the larger prisons of France, in which about 2000 convicts of both sexes are confined, and kept at industrial occupations. See an account of this prison in *Chambers's Edinburgh Journal*, 2d series, vol. i. p. 104.

FONTINA'LIS, a genus of Mosses, allied to *Hypnum*, but having the fruit in the bosom of the leaves, almost without stalk. Several species are British; one of which, the Greater Water-moss (*F. antipyretica*), growing upon rocks and roots of trees in brooks and ponds, is remarkable for the difficulty with which it burns, even when completely dried; on which account it is used in some parts of the north of

Greater Water-Moss (*Fontinalis antipyretica*):

Europe for lining chimneys, to protect the adjacent wood-work from fire. Its shoots are a foot or more in length, and branched; they float in the water. The fruit is on the sides of the stems or branches.

FOOD AND DRINK. Although nearly sixty elementary substances are known to chemists, only a comparatively small number of these take part in the formation of man and other animals; and it is only this small number of constituents which are essential elements of our food. These elements are carbon, hydrogen, nitrogen, oxygen, phosphorus, sulphur, chlorine, sodium, potassium, calcium, magnesium, iron, and fluorine.

Carbon, hydrogen, nitrogen, and oxygen are supplied to the system by the albuminous group of alimentary principles (see DIET)—viz., albumen, fibrine, and caseine, which occur both in the animal and vegetable kingdoms, and the gluten contained in vegetables. Animal flesh, eggs, milk, corn, and many other vegetable products, contain one or more of these principles. The gelatinous group also introduces the same elements into the system, when such substances as preparations of isinglass, calves' feet, &c., are taken as food. Carbon, hydrogen, and oxygen are abundantly introduced into the system in the form of sugar, starch (which occurs in large quantity in the cereal grains, leguminous seeds, roots, tubers, &c., used as food), and organic acids (which, as citric, malic, tartaric acid, &c., occur in numerous vegetables employed as food). Carbon with a little hydrogen and oxygen occurs abundantly in the oleaginous group of alimentary principles, as, for instance, in all the fat, suet, butter, and oil that we eat; in the oily seeds, as nuts, walnuts, cocoa-nuts, &c.; and in fatty foods, as liver, brain, &c. Phosphorus is supplied to us by the flesh, blood, and bones used as food (the flesh of fishes is especially rich in phosphoric matter), and in the form of various phosphates, it is a constituent of many of the vegetables used as food. The system derives its sulphur from the fibrine of flesh, the albumen of eggs, and the caseine of milk, from the vegetable fibrine of corn, &c., from the vegetable albumen of turnips, cauliflowers, asparagus, &c., and from the vegetable caseine of pease and beans. Most of the culinary vegetables contain it, especially the *Cruciferæ*. Chlorine and sodium, in the form of chloride of sodium, are more or less abundantly contained in all varieties of animal food, and are taken separately as common salt. Potassium is a constituent of both animal and vegetable food: it occurs in considerable quantity in milk, and in the juice that permeates animal flesh; and most inland plants contain it. We derive the calcium of our system from flesh, bones, eggs, milk, &c. (all of which contain salts of lime); most vegetables also contain lime-salts; and another source of our calcium is common water, which usually contains both bicarbonate and sulphate of lime. Magnesium in small quantity is generally found in those foods that contain calcium. Iron is a constituent of the blood found in meat; and it occurs in smaller quantity in milk, in the yoke of egg, and in traces in most vegetable foods. Fluorine occurs in minute quantity in the bones and teeth. This small quantity is accounted for by the traces of fluorine found by Dr George Wilson in milk, blood, &c.

These simple bodies are not, however, capable of being assimilated and converted into tissue; they must be previously combined, and this combination is primarily conducted by the vegetable kingdom. The number of combined elements varies: thus water contains only two; sugar, starch, fat, and many organic acids, contain three; caseine contains five; and fibrine and albumen contain six.

It would be impossible, and it is quite unnecessary, to mention in this article the different animals and plants that are used as food by different nations. The subject is, however, an interesting one, and those who wish to study it may be referred to Moleschott's *Physiologie der Nahrungsmittel*, 1850, and especially to Reich's *Nahrungs- und Genussmittelkunde* (1860—1861), which is the most learned and elaborate work on the subject in any language.

DRINKS are merely liquid foods. They all pertain to the aqueous group noticed in the article DIET. They are arranged by Pereira in his *Treatise on Food and Diet* in the six following orders:

1. Mucilaginous, farinaceous, or saccharine drinks—as toast-water, barley-water, gruel, &c. They are very slightly nutritive, and differ but little from common water.

2. Aromatic or astringent drinks—as tea, coffee, chocolate, and cocoa. The action of the first two is noticed in the article DIET. The last two drinks contain a considerable quantity of oil and starch.

3. Acidulous drinks—as lemonade, ginger-beer, raspberry-vinegar water, &c. They allay thirst both by the acid which they contain and the water, and form cooling antiscorbutic drinks.

4. Drinks containing gelatine and osmazome—the broths and soups. These, if properly prepared, should contain all the soluble constituents of their ingredients.

5. Emulsive or milky drinks—as animal milk, the milk of the cocoa-nut, and almond milk, a drink prepared from sweet almonds. Animal milk contains all the essential ingredients of food; the others are slightly nutritive.

6. Alcoholic and other intoxicating drinks—including malt liquor or beer in its various forms of ale, stout, and porter; wines; spirits in their various forms of brandy, rum, gin, whisky, &c.

'Considered dietetically,' says Pereira, 'beer possesses a threefold property: it quenches thirst; it stimulates, cheers, and, if taken in sufficient quantity, intoxicates; and lastly, it nourishes or strengthens. The power of appeasing thirst depends on the aqueous ingredient which it contains, assisted somewhat by its acidulous constituents (carbonic and acetic acid); its stimulating, cheering, or intoxicating power is derived either wholly or principally from the alcohol which it contains (from 2 to 3 per cent.); lastly, its nutritive or strengthening quality is derived from the sugar, dextrine, and similar substances contained in it; moreover, the bitter principle of hops confers on beer tonic properties. From these combined qualities, beer proves a refreshing and salubrious drink (if taken in moderation), and an agreeable and valuable stimulus and support to those who have to undergo much bodily fatigue.'

Wine is our most valuable restorative when the powers of the body and mind have been overtaxed; but as the most perfect health is compatible with total abstinence from it, no possible benefit can accrue to a healthy person from commencing its use. The uses of wine as a tonic during convalescence after lingering diseases, and of either wine or spirits in some acute diseases (fevers, &c.), are too well known to require notice.

The action of spirituous drinks has been noticed in the article DIET, and will be further discussed in the article TEMPERANCE.

We shall conclude this part of the subject with a word or two on the condiments or seasoning agents which are taken with foods for the purpose of improving their flavour. Excluding salt, which must be considered as a saline alimentary principle, the most common condiments, such as mustard,

um (Cayenne pepper), pepper, the various , &c., owe their action to the presence of a le oil. Sauces are usually fluid mixtures of condiments with alimentary substances. In thy state, condiments and sauces afford little nutrition; and although for a time they may late a debilitated stomach to increased action, continual use never fails to induce a subse- increased weakness of that organ. Salt and ur are the only exceptions. When used in ation, they assist in digestion; vinegar, by ing muscular fibre more fluid; and both er, by producing, as Dr Beaumont believes, l having some analogy to the gastric juice *riments and Observations on the Gastric Juice e Physiology of Digestion*, p. 40, Edin. 1838).

cookery of foods, although partially noticed articles BOILING, BROILING, COOKERY, DIET, equires some general consideration in the t place.

foods possessing an organised structure, as l flesh and amylaceous substances, require to oked before being eaten, the only exceptions the oyster and some ripe fruits. The processes ing, pickling, and smoking harden the animal es, and, as we shall presently see (at all events case of salting), induce chemical changes render the meat less nutritious.

ordinary operations of cookery are boiling, g. broiling. baking, and frying.

the case of vegetables, boiling effects the n of gummy and saccharine matters, the e and partial solution of starch grains, the ation of albuminous liquids, and the more or mplete expulsion of volatile oil. In the boiling h, there takes place a more or less perfect tion of the soluble from the insoluble con- nts, according to the duration of the boiling, nount of water employed, and its temperature commencement of the operation. If we he boiled meat to contain the largest amount rishing matter, and disregard the soup or that is simultaneously formed, we introduce the boiler when the water is in a state of boullition. We keep up this boiling for a few e, in order to coagulate the albumen near the , and thus to convert it into a crust or shell, equally prevents the entrance of water into erior, and the escape of the juice and soluble uents of the flesh into the water. If cold is then added, so as to reduce the tempera- about 160°, and this temperature is kept up e necessary time—for which, in reference to ight of the meat, see the article BOILING—conditions are, according to Liebig, united give to the flesh the quality best adapted to as food.

on the other hand, we wish to obtain good rom meat, we should place it in cold water, ring this *very gradually* to the boiling-point. terchange between the juices of the flesh and ternal water, which was prevented by the process, here takes place without hindrance. oluble and sapid constituents of the flesh are ed in the water, and the water penetrates e interior of the mass, which it extracts more completely. The flesh loses, while the soup in sapid matters; and by the separation of en, which is commonly removed by skimming, rises to the surface of the water, when ated, the meat loses its tenderness, and es tough and hard; and if eaten without up, it not only loses much of its nutritive ties, but also of its digestibility.'—Liebig's *ches on the Chemistry of Food*, p. 128.

ting is applied much more to meat than to vegetables. Both in roasting and broiling meat the first application of heat should be considerable and rapid, so as to form an outer coating of coagulated albumen (just as in boiling), which retains the nutritive matters within the cooked meat. In roasted meat, nothing is removed but some of the superficial fat and the gravy, which is itself an article of food. The effect of roasting on such vegetables as apples and potatoes is to render them more nutritive and digestible than they would be in the raw state, by splitting their starch grains, and rendering them more soluble.

Baking (q. v.) acts in the same manner as roasting, but meat thus cooked is less wholesome, in consequence of its being more impregnated with empyreumatic oil.

Frying is the most objectionable of all kinds of cookery. In this operation, heat is usually applied by the intermedium of boiling fat or oil. Various products of the decomposition of the fat are set free, which are very obnoxious to the stomachs of invalids.

Liebig has shewn that salted meat is, in so far as nutrition is concerned, in much the same state as meat from which good soup has been made. After flesh has been rubbed and sprinkled with dry salt, a brine is formed amounting in bulk to one-third of the fluid contained in the raw flesh. This brine is found to contain a large quantity of albumen, soluble phosphates, lactic acid, potash, creatine, and creatinine—substances which are essential to the constitution of the flesh, which therefore loses in nutritive value in proportion to their abstraction.

The preservation of food requires some notice. Three methods—viz., preservation by cold, preservation by the exclusion of air, and preservation by salting—are noticed in the article ANTISEPTICS. The first is only of comparatively limited application: the second, known as Appert's method, has been successfully used in the English navy for many years; the chief objection to it is its expense: the third method injures, as we have already seen, the character of the meat, and renders it both deficient in nutritive materials, and actually injurious if it forms a principal and continuous article of diet. To these methods we must add preservation by smoking, preservation with sugar, and with vinegar, and preservation by drying. It is well known that meat suspended in smoke loses its tendency to putrefy, the substance from which the smoke derives its antiseptic property being creasote, or some allied body. Smoked meat acquires a peculiar taste, a dark colour, and a somewhat hard consistence; but it retains all its nutritive constituents, and is thus preferable to salted meat. Sugar and vinegar are chiefly employed in the preservation of vegetable products. The most important mode of preserving articles of food, whether animal or vegetable, is by direct drying. Meat is cut up into small slices about a quarter of an inch thick, and vegetables into smaller pieces; they are steamed at a high temperature, so as to coagulate the albumen; and they are then completely desiccated by exposure to a current of very hot dry air. At the conclusion of the process, the slices of meat are quite hard, and present a shrivelled appearance. Dr Marcet (*On the Composition of Food*, 1856, p. 174) speaks in high terms of this method, which he has himself seen in operation in Paris. 'Food thus preserved,' he says, 'whether it be animal or vegetable, has the advantage (1) of remaining in a fresh condition, though freely exposed to the atmosphere for a great number of years, and (2) of being reduced to one-fifth of its original bulk from its having lost all its water.' He adds, that the preserved vegetables resume their bulk when

boil'd in water, and that they so completely retain their aroma, that it is often difficult to distinguish between soups made with them, and others prepared with fresh vegetables.

The adulteration of food of almost every kind is unfortunately so common a custom, that our limited space will merely allow of our noticing a few of the leading points in regard to it.

Wheat-flour is not unfrequently adulterated with one or more of the following substances—flour of beans, Indian corn, rye, or rice, potato-starch, alum, chalk, carbonate of magnesia, bone-dust, plaster of Paris, sand, clay, &c. The organic matters—the inferior flours and starch—do little or no serious harm; most of the inorganic matters are positively injurious, and of these, alum (one of the commonest adulterations) is the worst. The beneficial action of wheat-flour on the system is in part due to the large quantity of soluble phosphates which it contains. When alum is added, these phosphates are decomposed in the process of making bread, the phosphoric acid of the phosphates uniting with the alumina of the alum, and forming an insoluble compound; the beneficial effect of the soluble phosphates is thus lost.

Arrow-root is adulterated with potato-flour, sago, starch, &c. Out of 50 samples examined by Dr Hassall, 22 were adulterated, and in 10 of the samples there was scarcely a particle of the genuine article.

Sugar of the inferior kinds is occasionally adulterated with flour, gum, starch-sugar, &c. It is oftener, however, impure than intentionally adulterated.

Pepper is adulterated with linseed, mustard-seed, wheat-flour, &c.

Cayenne Pepper is adulterated with red lead, vermilion, red ochre, brick-dust, common salt, turmeric, &c.

Mustard is largely adulterated with ordinary and pea flour, linseed meal, and turmeric; and a little chromate of lead is sometimes added to improve the colour. Dr Hassall submitted 42 specimens of mustard to examination; the whole of them contained wheat-flour and turmeric.

Ginger is frequently adulterated. Out of 21 samples, Dr Hassall found that 15 contained various kinds of flour, ground rice, Cayenne pepper, mustard husks, and turmeric, which in most cases formed most of the so-called ginger.

Out of 26 samples of *mixed spices*, 16 were found by Dr Hassall to contain sago-meal, ground rice, wheat-flour, &c.

Curry powder (q. v.) was found by Dr Hassall to be very commonly adulterated, only 7 specimens out of 26 being genuine. In 8 of the samples red lead was detected. The frequent use of curries may thus often give rise to the disease known as lead-palsy.

The adulterations of *tea*, both by the Chinese and in this country, are too numerous for us to mention. See Hassall's *Adulterations Detected*, pp. 65—104.

Coffee, in its powdered form, is not merely largely adulterated with chicory, but additionally with roasted grain, roots, acorns, saw-dust, exhausted tan (termed croats), coffina (the seeds of a Turkish plant), burnt sugar, and (worst of all) baked horses' and bullocks' liver. In the *Quarterly Journal of the Chemical Society* for April 1856, there is an excellent Report by Messrs Graham, Stenhouse, and Campbell on the mode of detecting vegetable substances mixed with coffee. Even whole roasted coffee is not safe from adulteration, a patent having been actually taken out to mould chicory into the form of coffee-berries.

Cocoa and *Chocolate* are adulterated with flour, potato-starch, sugar, clarified mutton-suet, and various mineral substances, such as chalk, plaster of Paris, red earth, red ochre, and Venetial earth, the last three being used as colouring matters.

The adulterations of *beer*, *wine*, and *spirits* are noticed in the articles devoted to those subjects.

Vinegar is adulterated with water, sulphuric acid, burnt sugar, and sometimes with chillies, grains of paradise, and pyroligneous acid. The English law allows one part of sulphuric acid to 1000 of vinegar, with the view of preserving it from decomposition, but Dr Hassall found that in many cases three or four times the legal amount was present. It appears from evidence taken before the parliamentary committee on adulterations, that arsenic and corrosive sublimate are no uncommon ingredients in vinegar. In connection with vinegar we may place *Pickles*. Dr Hassall analysed 16 different pickles for copper, and discovered that poisonous metal more or less abundantly in *all* of them; 'in three, in a very considerable quantity; in one, in highly deleterious amount; and in two, in poisonous amount.' Preserved fruits and vegetables (especially gooseberries, rhubarb, greengages, and olives) are often also contaminated largely with copper. In these cases, the copper, if in considerable quantity, may be easily detected by placing a piece of polished iron or steel in the suspected liquid for 24 hours, to which we previously add a few drops of nitric acid. The copper will be deposited on the iron. Or ammonia may be added to the fluid in which the pickles or fruit were lying, when, if copper is present, a blue tint is developed. We should be suspicious of all pickles, olives, preserved gooseberries, &c., with a particularly bright green tint.

Milk is usually believed to be liable to numerous adulterations, such as flour, chalk, mashed brains, &c. It appears, however, from Dr Hassall's researches on London milk, that, as a general rule, water is the only adulteration. The results of the examinations of 26 samples were, that 12 were genuine, and that 14 were adulterated, the adulteration consisting principally in the addition of water, the percentages of which varied from 10 to 50 per cent., or one-half water. In the article MILK we shall describe the means of testing the purity of this fluid.

If space permitted, we might extend the list of alimentary substances liable to adulteration to a much greater length. In conclusion, we may remark, that, as a general rule, adulterations of an organic nature, such as flours and starches of various kinds, are best detected by the microscope; while chemical analysis is usually necessary for the detection of mineral adulterations. Dr Hassall's *Adulterations Detected* is a perfect cyclopædia on this subject.

FOOL. See COURT-FOOL.

FOOLS, FEAST OF. The Romans kept the festival of Saturn, in December, as a time of general licence and revelry. During the brief season of the Saturnalia (q. v.), the slave reclined on his master's seat at table, the master waited upon his slave, and society, for the moment, seemed to be turned upside down. The grotesque masquerade survived the pagan creed which gave it birth, and not only kept its place among the Christians, but, in the face of solemn anathemas of fathers and councils, found its way into the ceremonial of the Christian Church. It was called, at different times and places, by many different names, but has latterly come to be best known as the Feast of Fools (*Festum Futuorum*, *Festum Stultorum*).

The circumstances of the observance were almost infinitely varied, but it was everywhere marked by

me spirit of broad, boisterous drollery, and but not ill-natured caricature. The donkey such a frequent part in the pageant that it ten called the Feast of Asses (*Festum Asino-* In some places, the ass of Balaam was figured; ra, the ass which stood beside the manger h the infant Saviour was laid; elsewhere, the which the Virgin and Child fled to Egypt, ass on which Jesus rode into Jerusalem. In instance, there was more or less attempt at ic representation, the theatre being generally ief church of the place, and the words and of the drama being often ordered by its book monies. Several rituals of this sort are still ed. That which was in use at Beauvais, in , has a rubric ordering the priest when he es the congregation to bray three times, and g the people to bray three times in answer. ass was led towards the altar, he was greeted hymn of nine stanzas, of which the first runs

Orientis partibus,
Adventavit Asinus,
Pulcher et fortissimus,
Sarcinis aptissimus.
Hé, sire Ane, hé!

[From the regions of the East—
Blessings on the bonny beast!—
Came the Donkey, stout and strong,
With our packs to pace along.
Bray, Sir Donkey, Bray!]

the ass did not come upon the stage, the int of the farce lay in the election of a mock atriarch, cardinal, archbishop, bishop, or These mimic dignitaries took such titles as of Fools,' 'Archbishop of Dolts,' 'Cardinal askulls,' 'Boy Bishop,' 'Patriarch of Sots,' of Unreason,' and the like. On the day of lection, they often took possession of the s, and even occasionally travestied the per- e of the church's highest office, the mass, church's holiest place, the altar. In some s, the nuns disguised themselves in men's chanted mock services, and elected a 'little who for that day took the place of the real

Feast of Fools maintained itself in many ill the Reformation in the 16th century. At , in the south of France, it survived till the 44, when we have it described by an eye- in a letter to the philosopher Gassendi. ne was, as usual, a church; and the actors, themselves in priests' robes turned inside d prayers from books turned upside down, spectacles of orange-peel, using coal or r incense, amid a babblement of confused nd the mimic bellowings of cattle, and of pigs.

istory of the Feast of Fools has been treated al works; the best is the *Mémoire pour l'Histoire de la Fête des Fous*, by Du Tilliot, d at Lausanne in 1741; reprinted at Paris in d again in the *Recueil des Cérémonies et s Religieuses de Tous les Peuples*, tome viii. ndhomme, 1809.)

L'S PARSLEY (*Aethusa Cynapium*), an erous plant, very common as a weed in and fields in Britain, and in most parts of somewhat resembling parsley in its foliage eral appearance, so that serious accidents urred from its being mistaken for that herb; a poisonous plant, somewhat resembling in its properties. With the curled variety y it cannot easily be confounded, which is other accounts to be preferred; and when in flower it is readily known from every other plant in British gardens by its umbels wanting general

1, Fool's Parsley, general umbel; 2, Common Parsley, leaf and general umbel:
a, partial umbel of fool's parsley; *b*, fruit of common parsley; *c*, flower of common parsley.

involucres, and having partial involucres of three slender leaves hanging down on one side.

FOOT is the most common unit of lineal measure all over the world. It has been evidently taken originally from the length of the human foot, and as that varies in length, so does the measure; each country, and at one time each town, having a foot of its own. The three foot-measures that occur most frequently are the Paris foot, or *pied de roi*, the (German) Rhenish foot, and the English. Compared with the French *mètre* (= 3·28090 feet Eng.), they stand thus:

		Metre.			Inches English.
English foot	=	0·30479	Paris foot	=	12·78912
Paris "	=	0·32484	Rhenish "	=	12·35652
Rhenish "	=	0·31385			

In round numbers, 46 French feet = 49 English feet, 34 Rhen. or Germ. feet = 35 English, and 57 French feet = 59 Rhen. The Russian foot is equal to the English. Almost every German state has a different foot. The Rhenish foot is that used in Prussia. The longest foot occurring is the old Turin foot = 20 inches English. Many local feet are only about 10 inches. The foot has almost uniformly been divided into 12 inches; the inch into 12 lines, often into tenths. The French *pied usuel* is the third part of the mètre. See YARD, METRE.

FOOT, in Verse. See METRE, VERSE.

FOOT, STRUCTURE OF THE. In describing the structure of the foot, it is expedient to commence with a brief notice of the bones which occur in it. In man, these are 26 in number, and are arranged in three natural groups—viz., the tarsal bones, which are the hindermost; the metatarsal bones, which occupy the middle portion; and the phalanges of the toes anteriorly. The tarsal bones, seven in number, are short and thick, and form the heel and the hinder part of the instep. The uppermost (see fig. 1) is called the *astragalus*, from its supposed resemblance to the dice used by the Romans. Above, it is articulated or is jointed with the two bones of the leg, the *tibia* and *fibula*, and through these bones the whole weight of the body is thrown upon the two

astragali Behind, it is connected with and rests upon the *os calcis*, or heel-bone, which is the largest bone of the foot. Immediately in front of it, and supporting it in this direction, is the *scaphoid* or boat-like bone. In front of the scaphoid bone are the three *cuneiform* or wedge bones; and on the outer side of the cuneiform bones, and in front of the os calcis, is the *cuboid* bone. We see from the figure that the front row of tarsal bones is composed of the three cuneiform bones on the inner side

Fig. 1.

The dorsal surface of the left foot.

1, the astragalus, its upper articular surface; 2, its anterior extremity, which articulates with (4) the scaphoid bone; 3, the os calcis, or heel-bone; 4, the scaphoid bone; 5, the internal cuneiform bone; 6, the middle cuneiform bone; 7, the external cuneiform bone; 8, the cuboid bone; 9, the metatarsal bones of the first and second toes; 10, 11, the first and second phalanges of the great toe; 12, 13, 14, the first, second, and third phalanges of the second toe.

of the foot, and of the cuboid bone externally. There are five metatarsal bones passing forward, one for each toe. Each cuneiform bone is connected with one, and the cuboid bone with two, of these metatarsal bones. Behind, they are close together, but as they run forwards, they diverge slightly from one another, and their anterior ends rest upon the ground, and form the *balls* of the toes. They constitute the forepart of the instep. The remaining bones are those of the toes, and are named the *phalanges*, each toe having three of these bones, excepting the great toe, which has only two. (A similar law holds for the bones of the hand, each finger having three phalanges, but the thumb only two.)

The instep is composed of the seven tarsal and the five metatarsal bones, which are so arranged and connected (see fig. 2) as to form an arch from the extremity of the heel-bone to the balls of the toes. This is called the plantar arch, from *planta*, the sole of the foot. The astragalus forms the summit or keystone of this arch, and transmits the weight which it receives posteriorly to the heel, and anteriorly to the balls of the toes. This figure exhibits the arrangement of the fibres and laminæ in the interior of the bones, and shews that the greater number of them, in each bone, follow the directions of the two pillars of the arch, and thus give the greatest strength to the bones in the directions in which it is most required.

The bones, where they articulate with one another, are covered with a tolerably thick layer of highly elastic cartilage, and by this means, together with the very slight movements of which each bone is

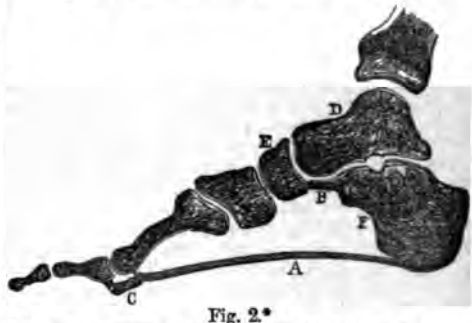

Fig. 2.*

This figure represents a section through the lower end of the tibia, and through the astragalus D, the heel-bone F, the scaphoid bone E, the internal cuneiform bone, and the bones of the great toe; A represents the plantar ligament, and B the interior calcaneo-scaphoid ligament passing from the heel-bone, F, to the scaphoid, E; C is one of two small bones called sesamoid bones, usually found at the ball of the great toe. The lines shew the disposition of the laminæ or plates of which the various bones are composed. The clear line along the contiguous edges of the bones represents the cartilage.

capable, a degree of elasticity is given to the foot, and consequently to the step, which would be altogether wanting if the plantar arch were composed of one single mass of bone. This elasticity is far greater in the anterior pillar of the arch, which is composed of five comparatively long bones sloping gradually to the ground, than in the posterior pillar, which is short, narrow, and composed of a single bone, which descends almost vertically from the ankle to the ground. Hence, in jumping from a height, we always endeavour to alight upon the balls of the toes, and thus break the shock which we should feel if, by accident, we descended upon the heels.

A reference to any standard work on anatomy (see, for example, Gray's *Anatomy*, pp. 178—184) will shew that the ligaments which unite these bones to one another, and by which the movements of each bone upon the others are limited, are very numerous. We shall merely notice two of these ligaments, selecting those whose action is especially obvious in maintaining the shape of the plantar arch. One, the *plantar ligament* (A, fig. 2), of great strength, passes from the under surface of the heel-bone, near its extremity, forwards to the ends of the metatarsal bones, according to Dr Humphry (*The Human Foot and the Human Hand*, 1861, p. 25). Most anatomists do not trace it quite so far forwards. 'In other words' (we quote from Dr Humphry's volume), 'it extends between the lowest points of the two pillars of the arch, girding or holding them in their places, and preventing their being thrust asunder when pressure is made upon the key-bone (D), just as the "tie-beam" of a roof resists the tendency to outward yielding of the sides when weight is laid upon the summit. The ligament, however, has an advantage which no tie-beam can ever possess, inasmuch as a quantity of muscular fibres are attached along the hinder part of its upper surface. These instantly respond to any demand that is made upon them, being thrown into contraction directly the foot touches the ground; and the force of their contraction is proportionate

* This, and several of the following diagrams, have been copied, with Dr Humphry's permission, from *The Human Foot and the Human Hand*.

legree of pressure which is made upon the
addition to its office of binding the bones in
ces, the ligament serves the further purpose
cting from pressure the tender structures
lood-vessels, nerves, and muscles—that lie
; in the hollow of the foot. Another very
igament (B, in the figure) passes from the
nd fore part of the heel-bone (F) to the
rts of the scaphoid bone (E). It underlies
ports the round head of the astragalus, and
bear a great deal of the weight which is
ted to that bone from the leg. It possesses
y which the ligament just described, and
aments have not—viz., elasticity. This is
portant, for it allows the head of the key-
) to descend a little, when pressure is made
and forces it up again when the pressure is
, and so gives very material assistance to
er provisions for preventing jars, and for
ase and elasticity to the step.'—Humphry,
pp. 25, 26.

pot over which the ligament B extends is
kest in the foot, the astragalus being there
rted by any bones; additional support is,
, afforded when it is most required by the

are two periods of life at which *flat-foot* is
y liable to occur: 1st, in infancy, if the
put upon its feet before the bones and
s—especially the latter—are strong enough
its weight; and 2dly, about the age of
—a period at which growth is very quick,
body consequently attains a considerable
id augmentation of weight. If young
of this age are obliged to be a great deal
feet, and perhaps additionally to carry
(as, for example, butchers' and bakers' boys,
ng nursemaids), the chances that flat-foot
r are increased.

w come to the movements of the foot upon

We see here a striking combination of
of movement with general security. This
tion is effected by the harmonious action
joints, each of which acts in a direction
from the others.

rst of these joints is the ankle-joint, which
d by the bones of the leg—the tibia and
bove, and the astragalus below. By this
e foot is bent or straightened on the leg.
nd joint is between the astragalus and the
e, and it permits the foot to be rolled
or outwards; while the third joint is
the first and second row of tarsal bones
, between the astragalus and heel-bone
nd the scaphoid and cuboid bones in front,
ws the degree of curvature of the plantar
be increased or diminished within certain
The following is the order in which the
nts of these three joints occur: the raising of the *heel* (by the first joint) is accompanied by a rolling of the foot *inwards* (by the second joint), and by an increased *flexure* of the plantar arch (by the third joint); and the raising of the *toes* is accompanied by a rolling of the foot *outwards* and a *straightening* of the sole. See Humphry, *op. cit.*, p. 42.

The joints, however, merely allow of movements they do not effect them: this is the special function of the muscles; and each of the three movements

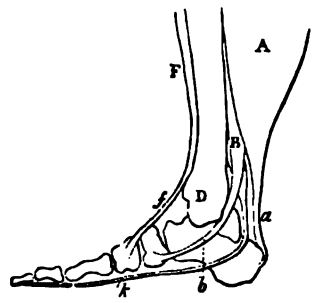

Fig. 3.

This figure represents some of the muscles and tendons seen on the inner side of the leg and foot.

A, the gastrocnemius and soleus muscles, forming the muscles of the calf; *a*, the Tendo Achillis; B, the posterior tibial muscle; *b*, its tendon; D, the inner ankle; F, the anterior tibial muscle, attached above to the front of the tibia, below to the internal cuneiform bone; *k*, the flexor tendon of the great toe.

we have indicated is effected by special groups of muscles. The first series of movements is mainly effected by three muscles: viz., (1) the *muscles of the calf* (fig. 3, A), attached above to the bones of the thigh and leg, and below by the *Tendo Achillis* to the heel-bone; (2) the *posterior tibial* (fig. 3, B), attached above to the tibia, and below by its tendon to the scaphoid bone, and (3) the *short*

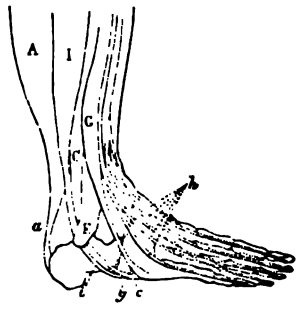

Fig. 4.

This figure represents some of the muscles and tendons on the outer side of the leg and foot.

E, lower end of fibula, forming the outer ankle; C, the short fibular muscle, attached above to the fibula, and below by its tendon (*c*) to the outer metatarsal bone; I, the long fibular muscle, its tendon (*i*) running behind the outer ankle and under the instep to the metatarsal bone of the great toe; G, the anterior or third fibular muscle, attached above to the fibula and below by its tendon (*g*) to the outer metatarsal bone; *h*, the extensor tendons of the toes.

fibular (fig. 4, C), attached above to the fibula, and below by its tendon to the outer metatarsal bone. The calf-muscles, whose tendon is inserted into the heel-bone, are large and very powerful, for in raising the heel, they have to raise the weight of the body. The other two muscles, the posterior

tibial and the short fibular, turn round the inner and the outer ankle respectively, and are inserted into the inner and the outer edges of the instep; the former being attached to the scaphoid, and the latter to the outer metatarsal bone. They not only assist to raise the ankle, but support it laterally. The muscle whose tendon is on the inner side of the foot (the posterior tibial), effects the two movements which are associated with the raising of the heel-bone, namely, the turning of the foot inwards, and the increased flexure of the arch.

The second series of movements—the raising of the toes, the turning of the foot outwards, and the straightening of the sole—are effected by two muscles, the *anterior tibial* (fig. 3, F) and the *third fibular* (fig. 4, G), whose tendons pass, one in front of the inner ankle, and the other in front of the outer ankle, to the corresponding edges of the instep, and are inserted into the internal cuneiform and the outer metatarsal bones. These muscles are direct flexors of the tarsus upon the leg; the former raising the inner, and the latter the outer border of the foot.

Another point in the anatomy of the foot that requires notice, is the mode of union of the metatarsal with the tarsal bones. In these joints in the fourth and fifth toes a slight revolving motion can take place, which probably enables the outer metatarsals to adapt themselves to inequalities of the ground, and to equalise the distribution of the weight which is thrown upon the foot; while, in the corresponding joints of the three inner toes, scarcely any motion can occur—a provision by which additional strength is given to the inner side of the foot upon which the weight of the body most directly falls.

The skin of the sole is very tough and strong; and intervening between it and the bones and long plantar ligament is a thick pad of fat, which acts the part of an air or water cushion in defending the adjacent parts from injurious pressure, and in deadening the jars and shocks that would otherwise be felt in leaping, &c.

A few remarks on the subject of shoes may here be added. The shape of the sole of the natural foot is shewn in fig. 5, while the shape after the prolonged use of a badly made shoe is given in fig. 6. In the

Fig. 5.

Fig. 6.

foot in its normal state, the great toe is seen to be free from the others, and the line of its axis prolonged backwards, passes through the centre of the heel; while in the foot distorted by the use of the shoe, the line of the great toe is quite altered, and the toes generally—not being able to find room side by side—overlap each other, and lose their separate and individual actions; corns, bunions, and ingrowing toe-nails being the natural consequence of this maltreatment. Professor Meyer, of Zurich, has drawn attention to the bad treatment which the foot receives from ordinary shoemakers, in a pamphlet, translated by Mr Craig, and entitled *Why the Shoe Pinches; a Contribution to Applied Anatomy*. He especially points out that the great toe should be allowed to have its normal position, and this can be done by making the inner edge of the sole incline *in*wards, instead of *out*wards, from the balls of the toes. The accompanying figure (7) gives the outline of a shoe designed under Dr Meyer's superintendence, and shews the difference between it and the usual shape; the latter being indicated by the dotted outline. Dr Humphry, from whose admirable work we have drawn much of this article, while fully according in Meyer's views, additionally protests against high heel-pieces, as tending to make the step less steady and secure, to shorten it, and to impair the action of the calf-muscles; a high heel-piece, moreover, places the forepart of the foot at a lower level than the heel; the weight is thus thrown too much in the direction of the toes, and they are thrust forwards and cramped against the upper leather of the shoe.

The subjects of WALKING, RUNNING, and JUMPING are noticed in the article MOVEMENTS, ANIMAL.

If we compare the human foot with the feet of other mammals, we find that it presents certain

Fig. 7.
A shoe designed by Dr Meyer, the dotted outline being the usual shape.

Fig. 8.
Foot of Gorilla.

peculiarities, all of which have reference to man's erect posture. The chief peculiarities are—1. The greater relative size of the tarsal bones, as compared with the other bones of the foot, and the more perfect formation of the plantar arch, which is higher and stronger than in any of the lower animals. Strength and elasticity are thus combined in the human foot in the highest degree. 2. The great toe is remarkable in man for its size and strength, and for the firm manner in which its metatarsal bone is joined to the other bones, so as to render it the main support to the foot. 3. If we compare the human foot with that of the gorilla or any other anthropomorphous ape, we see that the toes are short and small in man in relation to the other parts of the foot, while in the gorilla the toes form the greater part of the foot. Indeed, a reference to fig. 8 shews that in this animal (and the same is the case in all the *genera* of apes and monkeys) the organ in question is rather a *hand* than a *foot*, and hence the term *quadrumanous*, as applied to this class of animals. There is scarcely any plantar arch, and

ght of the body bears chiefly on the outer
the foot; the digits are long and strong,
inner one diverges so as to form a thumb
han a great toe.

mains to notice some of the most marked
s of form which the bones of the foot
in mammals. In the following group of
the same letters are attached to the same

Fig. 13.
Elephant.

Thus, *a* marks the astragalus; *cl*, the
m or heel-bone (the posterior projection
h forms the hock of the horse); *s*, the
.; *b*, the cuboid; *ce*, the ecto-, or outer,
meso-, or middle, and *ci*, the ento-, or
cuneiform. Now, as a general rule in all
ia, the ecto-cuneiform supports the third or
of the five toes when they are all present,
-cuneiform the second, and the cuboid the
nd fifth. Bearing in mind this law, we
the large bone in the horse, known as
on-bone, which is articulated to the ecto-
n, *ce*, is the metatarsal of the third toe, to
re articulated the three phalanges of that
last phalanx, 3, being expanded to form

The small bone,* popularly known as the
ne, and articulated to the meso-cuneiform,
rudimentary or stunted metatarsal of the
se, 2; and the outer splint-bone, articulated
iboid, is the rudimentary metatarsal of the
e, 4; so that in the horse we have only one
third, sufficiently developed to reach the
with mere traces of a second and fourth
ther side.

foot of the ox, the cuboid, *b*, is relatively
larger than in the horse, and is equal in size to the ecto-cuneiform, *ce*. The cannon-bone articulates with both these tarsal bones, and hence answers to the metatarsal bones of both the *third* and *fourth* digits; it is accordingly found to consist of two distinct bones in the fœtus; and in the adult it is divided internally into two cavities, and its original separation is marked out by an external elongated ridge. At the lower end are two distinct joints for the phalanges of the third and fourth toes. While in the horse we had the rudiments of the *upper* parts of two toes (the second and fourth), in the ox we have the rudiments of the *lower* parts or phalanges of two toes (the second and fifth), forming the 'spurious hoofs,' and marked 2 and 5 in the figure. In the rhinoceros there is one principal toe (the third), as in the horse, with the second and fourth toes in a less developed state; while in the hippopotamus there are two principal toes (the third and fourth), as in the ox, with the second and fifth toes not fully developed. In the elephant, there is a fifth digit added, answering to our great toe, and articulating with an ento-cuneiform bone, so that in the foot of this animal we have all the bones occurring in the human foot.

Professor Owen, to whose works we are indebted for these remarks, concludes from these and similar observations that the course of the simplification of the five-toed foot is, first, a diminution and removal of the innermost toe; next, of the outermost; then, of the second; and lastly, of the fourth; the third or middle toe being the most constant and (in the lower animals) the most important of the five.

FOOT, in Music, is a term made use of in the same way as in poetry, denoting a short melodic figure of notes with only one accent. Foot is also now beginning to be used in speaking of the pitch of sounds. The Germans have always used the word *Fusston* in representing the pitch of the different stops of an organ, such as *Principal* 16 F., 8 F., or 4 F., &c., which practice is now being introduced into English organs, and is found very useful to organists. The pitch of the stop is fixed according to the length of the lowest C pipe. See ORGAN-BUILDING.

FOOTA-BONDOU. See BONDOU.

FOOTBALL. This game has long been a favourite throughout the British Isles; and as a winter game in certain places, such as Rugby, Eton, Winchester, and the university of Glasgow, it is more popular than any other. A large park or common is best suited for the game, one of the most attractive features of which is, that it may be simultaneously enjoyed by great numbers of players irrespective of age or size. Two 'goals'—consisting each of a couple of upright poles, ten, twelve, or even eighteen feet high, and a cross-bar on top—are erected opposite each other, at any distance that may be agreed upon, the game being carried on in the intervening space. Two side-lines, called goal-lines, are drawn from each of the goals. The players are chosen by two captains, who arrange their men in the field, and keep them to their respective sides, and whose duty it is besides to see that fair play is carried on. After each captain has posted a trustworthy member of his side at the goal as 'keeper,' the players on each side are duly placed, and the game is begun, by the ball being kicked towards one of the goals from a point midway between each. Whichever side contrives to kick the ball *through* the adversaries' goal, reckons either 'game' or one towards it, though, where the players are equally matched, and the goals well defended, the play may last many hours without a single score being made. After each goal

* The bone is not shewn in the figure.

has been made, the players usually change ends, so that no undue advantage be derived by one side from sloping ground, favouring wind, &c.

The ball generally used is made of an ox-bladder covered with strong leather; india-rubber balls are considered inferior.

With popular games, such as cricket, &c., the rules laid down are for the most part binding all over the country; the same remark, however, does not apply to football, as each district seems to have rules of its own. Thus, those of Rugby, Winchester, Eton, &c., all differ materially, though the general methods of playing the game are the same.

The following, which we borrow from *Every Boy's Magazine*, No. 1 (London, Routledge), in which there is an excellent treatise on the game, are sufficient for general purposes. 1. The game being essentially *foot*-ball, no player may take up the ball from the ground. 2. If a player can catch the ball in the air, he may take a hand-kick without the other side being permitted to interfere. (A hand-kick consists in dropping the ball from the hands, and kicking it on its fall.) 3. If such player shall drop the ball accidentally, or in any way touch the ground with it, the opposite side may attack it. 4. If the ball pass outside or over the goal, and beyond the goal-line, the junior player of the side which drove it over shall fetch the ball, stand twelve paces to the right of the centre point (midway between the goals), and throw it gently to the centre without favour to either side. This rule is used because it sometimes happens that irritable players, finding the enemy's goal too well defended, wilfully kick the ball far beyond it, hoping to exhaust their opponents, and thus needlessly prolong the game. It is a mark of bad play, as well as unmanliness, to drive a ball where it can be of no use, and the penalty deprives the offending side of the junior player while he throws in the ball, and thus has the effect of deterring them from repeating the error. 5. Any kicking, except at the ball, is prohibited. 6. The ball must be *kicked* through the goal, not struck or thrown, or touch any part of any player of the same side, except the foot of him who kicks it; otherwise, the ball is fetched back, as in rule 4.

FOOTE, Samuel, actor and writer of comedy, was born of a good family at Truro, in Cornwall, 1720. He was educated at Worcester College, Oxford, and about 1740 entered the Temple; but after a career of 'pleasure' extending over four years, in the course of which he managed to dissipate a couple of fortunes which had been left him, he turned his attention to the stage as a means of support, and in 1744 made an unsuccessful début in the character of Othello. In 1747, he opened the Haymarket Theatre—where he was at once director, actor, and dramatic author—with a piece entitled *Diversions of the Morning*. In this and other pieces, he introduced well-known living characters, and, by his admirable powers of mimicry, succeeded in drawing large audiences, till the theatre was closed by order of the magistrates. After 1752, he continued to perform alternately in London and Dublin. In 1766, he broke his leg by a fall from his horse, and amputation was found necessary. He, however, recovered his health and spirits, and even turned the incident to account on the stage, composing parts expressly adapted to his own state. He died at Dover, 21st October 1777. A variety of comic anecdotes respecting F. are given in Cooke's *Memoirs of Samuel Foote* (London, 1805). His conversation must have been inimitably comical. Dr Johnson, who had a power of refusing to be pleased against his will greater than most men, met F. for the first time at Fitzherbert's, and assumed his most ursine manner; but it was no use: 'I was obliged,' he says, 'to lay down my knife and fork, throw myself back in my chair, and fairly laugh it out. Sir, he was irresistible.' His dramatic works, of which the best are *An Auction of Pictures*, *The Minor*, *The Englishman Returned from Paris*, *The Bankrupt*, *The Liar*, and *The Mayor of Garratt*, have been frequently published, but never in a complete form. Compare Forster's essay in the *Quarterly Review*, 1854.

FOOT-GUARDS, the flower of the British infantry, and the garrison ordinarily of the metropolis, comprise three regiments, the Grenadier, Coldstream, and Scots Fusilier Guards, in all seven battalions, and 6307 officers and men of all ranks. For their history and a more particular description, see the general article Guards.

FOOT-POUND is the unit by which the *work done* by a force is estimated; thus (taking 1 lb. and 1 foot as the units of weight and distance), if 1 lb. be raised through 1 foot, the *work done* is equal to 1 foot-pound; if 10 lb. be raised 9 feet, the *work done* is 90 foot-pounds; and generally, if W represent the *work done*, P the *weight in pounds*, and *h* the *height in feet*, then W (in foot-pounds) = P*h*.

FOOT-PRINTS. See Ichnology.

FOOT-ROT amongst sheep is of two varieties, the commoner consisting of an inordinate growth of hoof, which, at the toe, or round the margin, becomes turned down, cracked, or torn, and thus affords lodgment for sand and dirt. Insufficient wearing of the hoof is the obvious cause, and hence the prevalence of foot-rot in soft rich pastures, and especially amongst sheep previously accustomed to bare, rough, or upland walks, where the hoof is naturally worn down by the greater amount of walking necessary to procure sustenance. Taken in time, when lameness is first apparent, and before the hoof is cracked, and the foot inflamed, a cure rapidly follows the careful paring of the superfluous and diseased hoof; indeed, further treatment is scarcely necessary, unless any of the vascular parts have been laid bare, when a little tar may be applied as a mild astringent and protection from flies. When, from inattention or neglect, the hoof is separated from the sensitive parts beneath, when ulcers appear on the sole, or proud-flesh springs up, active astringents or mild caustics are necessary. The shepherd's old favourite butter of antimony, diluted with an equal quantity of tincture of myrrh, is a good remedy when cautiously and temperately used. A convenient paste, which in inexperienced hands is safer than a fluid caustic, may be made with equal weights of flowers of sulphur and finely powdered sulphate of copper, rubbed up to the needful consistency with lard or oil. Many have great faith in a mixture of the salt of copper with gunpowder and lard.—The second and more troublesome variety is allied to what is termed *foul* in the foot; instead of commencing at the ground surface, it begins in the interdigital space, appears to depend upon constitutional rather than local causes, and frequently occurs along with the other variety, but, unlike it, occasionally becomes contagious. The foot is hot, tender, and swelled around and immediately above the coronet. There are ulcerations in the interdigital space, and the swelling, and subsequently the sprouting of proud-flesh, cause a separation of the toes. When the tenderness and heat are great, poultices are advisable; but in the milder cases and earlier stages, the parts should be well washed with a solution containing to the pint of water half an ounce each of sulphuric acid and oil of turpentine.

The fossil species are still more nume-
onstitute great part of some calcareous
f chalk. The F. are of very beautiful
ne of the simple ones are orbicular, some
ask-shaped; those in which the animal
nto segments, and the shell consequently
sometimes have the segments arranged
ht line, sometimes spirally, sometimes
alternately, &c. The great resemblance of some of the convoluted chambered shells of the F. to the shells of the genus *Nautilus*, led Linnæus and many naturalists to rank them with that genus, and the F. were reckoned among the most highly organised molluscs, a place from which comparatively recent discoveries have completely removed them. They are now regarded as more nearly related to Sponges and to such animals as the *Proteus* or *Amœba*. 'The *Foraminifera* are evidently composite fabrics evolved by a process of continuous gemmation, each gemma remaining in connection with the body by which it was put forth, and according to the plan on which this gemmation takes place will be the configuration of the shell.'—Rymer Jones. Reproduction takes place by the detachment of minute granules in great numbers, and is apparently accompanied with the death of the parent. See PROTOZOA.

Fossil Foraminifera. The earliest records of this order yet observed are in sandstones near St Petersburg, belonging to the Lower Silurian measures. Scattered through these sandstones are numerous green grains, which have been shewn by Ehrenberg to contain, in their interior, silicious casts of shells similar to the recent genera *Guttulina* and *Textularia*. Forms, apparently referrible to the last genus and to *Fusulina*, constitute a large portion of some beds of carboniferous limestone in Russia, and also in the United States. Among the Secondary rocks, and especially in the Chalk, foraminifera are very abundant. Chalk, indeed, is composed almost entirely of the perfect or broken shells of *Rotalia*, *Spirulina*, *Textularia*, &c. (see CHALK). They are not more numerous in the Tertiary strata, but here they attain an enormous size—gigantic compared with any that preceded them, or with recent forms. Vast beds of limestone occur on the borders of the Mediterranean, composed almost entirely of these large forms. See NUMMULITE and NUMMULITIC FORMATION.

FORBES, DUNCAN, of Culloden, a celebrated Scottish politician of the 18th c., and Lord President of the Court of Session, was born either at Culloden or at Bunchrew—for the family possessed both estates—in the neighbourhood of Inverness, on the 10th November 1685. In 1704, the year that his father died, F., then a lad of 19, commenced his legal studies in Edinburgh; but the following year he removed to Leyden, then the great school for Scottish lawyers of revolution principles, where he studied for two years with the greatest diligence. In addition to the knowledge of the civil law, which was no doubt the principal object of his residence at Leyden, we are told that he made considerable progress in Hebrew and several other Oriental languages. On his return from Leyden, F. was called to the bar, and almost immediately after appointed sheriff of Midlothian—a promotion the rapidity of which is somewhat inconsistent with modern usages. He rose rapidly into practice and into political influence through his connection with the Great Duke of Argyle, then in the zenith of his power, to whom he was united by family ties, and of whose estates he acted as a sort of manager. He married Mary Rose, the daughter of the Laird of Kilravock, a woman of beauty and accomplishment, to whom he is said to have been devotedly attached. She died shortly after their marriage, leaving him an only son, John, who eventually succeeded to his estate, but did not inherit his abilities. During both of the rebellions, Duncan F. acted a prominent part on the side of the Hanoverian government. In 1715, he was in the north, actively engaged in opposing the rebels, along with his elder brother John, who is said to have expended £3000 on the royal cause.

not one shilling of which was ever repaid him. But on this, as on all other occasions, Duncan's partisanship was of the most moderate kind. After the suppression of the rebellion, he was opposed to the project of carrying the prisoners out of Scotland, to be tried by English juries, and he wrote to Lord Islay, when he heard that it was proposed to appoint him lord advocate, that he should certainly decline that office. He wrote to his brother, proposing a subscription for the comfort of the prisoners. 'It is certainly Christian,' he said, 'and by no means disloyal, to sustain them in their indigent state till they are found guilty.' To the forfeitures also he was opposed, on grounds of policy as well as of humanity. The only effect of his moderation was to bring suspicion on his own loyalty. But he was too important for his promotion to be arrested. In 1716, he was appointed depute to the lord advocate; in 1722, he was returned to sit in parliament for the Inverness district of burghs; and in 1725, he was lord advocate. He was not distinguished as a debater, but he was largely employed at this period of his career in appeal cases, and he enjoyed the friendship of Sir Robert Walpole, Lyttleton, Mansfield, and Hardwick. He seems even to have penetrated the literary circles in which Swift, Pope, and Arbuthnot were the ruling stars. In 1734, his brother John—Bumper John, as he was called—died, and he succeeded to the estates of the family. In earlier life, Duncan partook of the convivial habits for which his family was distinguished, in an age that was famous for deep potations. Mr Burton records various anecdotes illustrative of his powers in this direction, but he abandoned the practice when his health began to suffer, and devoted himself to more serious if not more onerous duties. During many subsequent years, he in no insignificant degree ruled the destinies, and contributed to the dawning prosperity of Scotland by fostering and developing her internal resources. His policy was to extinguish the rebellion by gaining over the Jacobites to the government. The purity and uprightness of F.'s character were subjected to a severe test. His whole correspondence during these troubled times came to light some seventy years after his death; and though few men ever wrote or were written to with less idea of publication, 'we have not,' says Mr Chambers (*Biographical Dictionary of Eminent Scotsmen*), 'to detect a single one of his advices or proceedings, by the exposure of which even a private gentleman of the most delicate honour, and the most reasonable views, would have cause to feel a moment's uneasiness.' Having freed himself from the shackles of party, his great object was to improve the trade and agriculture of the kingdom. But his views of political economy were not greatly in advance of his time; for in order to encourage the use of malt, he presented to the government a long and detailed scheme for preventing, or rather for punishing the use of tea. F. was appointed President of the Court of Session in 1737; but he still continued his interest in the general improvement of the country. Though he was aware of the character, and, in general, of the designs of the Jacobites, the rebellion of 1745 took the President by surprise. But he was no sooner aware of the danger than he hastened to the north, as he had done on the occasion of the former outbreak, and by his presence and the influence which he possessed in his own district, did much to counteract the proceedings of the rebels. Lovat, as is well known, betrayed both him and the government, and actually made an attack on Culloden House, from which he was beaten off with great spirit by the President and his people. When the rebellion spread, he was forced to abandon his house, and take refuge in the island of Skye, where he remained till after the battle of Culloden. On his return, in place of reaping the fruits of his services, he was regarded with jealousy and aversion by the government. Even the large sums of money which he had advanced were never repaid him; and it is said that the ingratitude of the government, coupled with the perfidy of many of his friends and neighbours, who had changed sides more than once during this miserable affair, weighed so heavily on his spirits as to shorten his life. He discharged his judicial duties, however, with great zeal and ability till within a month of his death, which took place on December 10, 1747. There is a beautiful portrait of the Lord President F., who was a man of great elegance of person and manner, in the Parliament House in Edinburgh. The most recent and complete biography of Forbes is that of Mr Burton in his Lives of Simon Lord Lovat and Duncan Forbes, 1848.

FORBES, EDWARD, an eminent naturalist, was born at Douglas, Isle of Man, February 12, 1815, and died in Edinburgh, November 18, 1854. He received a desultory and imperfect education in early life, in consequence of ill health; but when he left home at the age of 16, he had already possessed himself of a very considerable amount of knowledge in the departments of botany, zoology, and geology. In 1831, F. went to London, with the intention of becoming a student at the Royal Academy; but although he evinced much readiness in drawing, his artistic talents were not sufficiently marked to hold out any prospect of success in the event of his making art his profession; and he therefore determined to turn his attention to medicine, and, with this view, entered the university of Edinburgh. In 1836, he finally relinquished his special medical studies, to devote himself exclusively to the natural sciences. In 1836—1837, he attended lectures at Paris, where he studied under Geoffroy St Hilaire, Jussieu, and De Blainville, while he at the same time availed himself with diligence of all the advantages afforded to students by the museums and libraries of Paris. From the first year of his college life, F. had spent his summer vacations in rambles over various parts of Great Britain, or in excursions on the continent, and the results of the observations which he made during these tours, which were published by him either in the form of separate works, or in the pages of current scientific journals, sufficiently attest his diligence as an observer, and his exact appreciation of analogies and differences of forms. F. may almost be regarded as the originator of the use of the dredge, which he employed with equal success in investigating the marine fauna of our own seas, and of the Mediterranean and the Ægean. In 1841, he joined the surveying ship *Beacon*, as naturalist, and accompanied that vessel during the survey of a part of Asia Minor, and co-operated in the exploration of many of the Xanthian cities. On his return to England in 1843, he found that he had, during his absence, been elected to the chair of botany, King's College, London. He was soon afterwards named curator of the Geological Society; and from that period till his removal to Edinburgh, he remained in London, living in a vortex of scientific labours and literary work. In 1844, he was appointed palæontologist to the Museum of Geology in connection with the Ordnance Geological Survey; and in 1851, on the opening of the new buildings in Jermyn Street, London, he was named professor of natural history in the School of Mines. In 1852, he was chosen president of the Geological Society, an honour never before conferred on so young a man; and in 1853,

leath of Professor Jameson, he was elected
cant chair of Natural History in the univer-
Edinburgh. In the summer of 1854, he deli-
short course of lectures—the only one he was
to give—for at the commencement of the
session he was seized with a severe illness,
speedily proved fatal, and terminated his life
59th year of his age, in the very zenith of
, and in the full vigour of his intellectual
F. had been a voluminous writer and a
observer of nature from his earliest youth,
collected an immense mass of materials,
which were, however, left at his death in a
ised condition. He did much to advance and
tise special departments of natural history,
his own labours and by the stimulus which
rted to his associates and pupils; and it
e difficult to instance any naturalist who
cised a greater influence on the thought and
quiry pursued by those who have cultivated
e branches of knowledge. His classifica-
he British *Star-fishes* opened a new era in
uch of zoology; and his discovery that
hing molluscs lived at the period of the
beds, has been the means of rectifying many
s hypotheses, and throwing unexpected
several hitherto obscure points of geology,
he inferences which he drew from the
of those animals have been fully corro-
His Report on the Ægean Sea, and his
ions of the tertiaries of Cos, which have
f great value to geology, raised him to the
rank among living naturalists. From an
riod, he had directed his attention to the
ion of animal and vegetable life in different
the sea and land, and his observations
path of inquiry have opened many new
research. F. was a diligent contributor
current scientific literature of the day,
ny of his best papers were written for
tings of the British Association, of which
an active member, and for the various
with which he was connected; while he
k a most efficient share in the labours of
nance Survey during his connection with
His separate works, papers, and mono-
of which upwards of 200 are published,
ny of which are copiously illustrated by
beautiful drawings, cannot be individually
; but among them we may instance the

ne (1838); *Malacol. Monensis* (1838); *Star*
1841); *The Radiata and Mollusca of the*
1843); *Travels in Lycia* (written in con-
with Lieutenant Spratt, 1846); *Naked-*
eduse (1847); *British Mollusca* (1853, 4
o, conjointly with S. Hanley); the Map
ozoic Belts (Johnston's *Phys. Atlas*, 1854);
of Literary Papers by E. Forbes (1855);
Memoir by G. Wilson and A. Geikie, 1861.

BES, Sir William, of Pitsligo, Bart., an
Scottish banker, son of Sir William Forbes,
dvocate, was born in Edinburgh, April 5.
He succeeded his father when only four
l, and received his education at Aberdeen.
5th year, he was introduced into the bank
burgh of Messrs John Coutts & Co.; and
was admitted a partner. In 1763, one of
thers Coutts having died, while another
on account of ill health, and two others
tled as bankers in London, a new company
ned, consisting of Sir William Forbes; Mr
afterwards Sir James Hunter Blair; Mr,
ds Sir Robert Herries; and Messrs Stephen
hrane. They at first carried on business in
e of the old firm. On 1st January 1773,
however, on some changes in the partnership taking
place, the name was changed to that of Sir W.
Forbes, J. Hunter, & Co., and of this firm Sir William
continued to be the head till his death. In 1781,
he purchased the estate of Pitsligo, Aberdeenshire,
which had been forfeited by Lord Forbes of Pitsligo
for taking part in the rebellion of 1745. Animated
by genuine patriotism and public spirit, he intro-
duced the most extensive improvements on it, and
laid out and built the village of New Pitsligo. He
was a member, with Johnson, Burke, Garrick, Rey-
nolds, and others, of the celebrated Literary Club of
London, and the author of a Life of his friend, Dr
Beattie, the poet, published, with his works, in 2
vols. 4to, in 1805; also of *Memoirs of a Banking*
House, being the history of his own, edited by Mr
Robert Chambers (Edinburgh, 1860). He died at
his seat near Edinburgh, November 12, 1806, aged
68. By his wife, Elizabeth, eldest daughter of Sir
James Hay of Hayston, Bart., he had three sons
and five daughters. Universally esteemed and
respected, his character is well described by Sir
Walter Scott in the introductory address of one of
the cantos of *Marmion*. His bank became, in 1830,
the Union Bank of Scotland.

FORBES, James David, Principal of the United
College in the university of St Andrews, a grand-
son of Sir W. Forbes, the banker, was born at
Colinton, near Edinburgh, April 20, 1809. He
studied in the university of Edinburgh from 1825
until 1830, when he was admitted to the Scottish
bar. On the death of Sir John Leslie (q. v.), he
was appointed, in 1833, to the chair of natural
philosophy in the university of Edinburgh, after a
contest in which, among other competitors, he was
opposed by Dr (afterwards Sir David) Brewster and
Mr Galloway. In 1842, the Institute of France
enrolled him among its corresponding members.
He is, besides, a member of numerous other scientific
societies at home and abroad, has received the
Royal and the Rumford medals from the Royal
Society of London, and two Keith medals from
the Royal Society of Edinburgh, and is D.C.L. of
Oxford. In 1860, F. resigned his chair in Edin-
burgh, to become Principal of the United College
in the university of St Andrews. Among his
contributions to science are the polarisation of
radiant heat by the tourmaline, and also by
reflection (1836), and its circular polarisation—
discoveries forming some of the strongest proofs
of the identity of calorific and luminous rays; the
unequal polarisation of heat from different sources
(1844); the refrangibility of heat; the depolarisation
of heat; &c. This whole series of experimental
results is of a very high order of importance. He
is, however, best known to the world in general
by his researches on the motion of glaciers. See
Travels in the Alps (1843); *Norway and its Glaciers*
(1853); *Tour of Mont Blanc and Monte Rosa*
(1855); and *Occasional Papers on the Theory of*
Glaciers (1859). He was undoubtedly the first to
establish the great *fact*, that glacier ice moves in
its channel like a viscous fluid, the middle moving
faster than the sides, and the upper portions faster
than the lower. His *theory* of glacier phenomena
has encountered a good deal of opposition from some
quarters, and cannot yet be considered as settled.
See Glaciers. In meteorology, F. has, among
other things, improved Wollaston's application of
the thermometer to the determination of heights,
and has verified with great care Fourier's theoretical
results concerning the temperature of the ground
at different depths and in different kinds of soil and
rock. Besides the works already named, numerous
very valuable papers by F. are to be found in the
Transactions of the Royal Societies of London and

Edinburgh, in the *Edinburgh Philosophical Journal*, and other periodicals.

FORBES, Sir John, an eminent physician, was born October 18, 1787, at Cuttlebrae, Banffshire, and died November 13, 1861. After studying at Aberdeen and Edinburgh, he entered the navy in 1807 as assistant-surgeon, and continued on active duty till 1816, when he finally left the service. In 1817, he took the degree of M.D. at Edinburgh, and soon afterwards settled as a physician at Penzance, from whence he removed in the course of a few years to Chichester. In 1840, F. went to London, where he speedily obtained a large practice. He was knighted in 1853 by the Queen, to whose household he held the appointment of Physician in Ordinary, while he was at the same time Physician Extraordinary to Prince Albert. He was a Fellow of the College of Physicians, and the Royal Society of London; D.C.L. of Oxford, and a member of numerous foreign societies. F., conjointly with Drs Tweedie and Conolly, was the editor of the *Cyclopædia of Practical Medicine*, which, in addition to the numerous contributions of the editors, included the labours of more than sixty British physicians, of the first rank. This work, which has exercised a most beneficial influence both on the theory and practice of medicine, was completed in 4 vols. 8vo, in 1835. In 1836, F. founded the *British and Foreign Medical Review*, which he carried on with great success for twelve years. The services which he thus rendered to his brother-practitioners placed him deservedly among the foremost of his profession. To F. in a great measure belongs the merit of having introduced the use of the stethoscope in England, and of having successfully directed the attention of British practitioners to the art and practice of physical diagnosis. In 1831, he published the first edition of his translation of Laënnec's *Treatise on Auscultation*; and in 1838, when the fifth edition appeared, the new method was already extensively used. F. was a ready and pleasant writer, as is amply shewn by the various records of his summer rambles; among which we may instance his *Physician's Holiday* (1849), and his *Sight-seeing in Germany and the Tyrol* (1856). His last professional work, entitled *Nature and Art in the Cure of Diseases* (1857), contains a systematic exposition of his medical opinions and doctrines.

FORBES MACKENZIE ACT. The statute, popularly known by the name of the gentleman (Mr Forbes Mackenzie, M.P. for Peeblesshire) who introduced the bill, is the 16 and 17 Vict. c. 67, entitled 'An Act for the better Regulation of Public Houses in Scotland.' This act retained in general the provisions of 9 Geo. IV. c. 58, by which the granting of certificates by justices of the peace and magistrates, authorising persons to keep common inns, ale-houses, and victualling-houses in Scotland was regulated. But it prohibited the granting of certificates for excisable liquors to be 'drunk on the premises,' unless on the express condition that no groceries or other provisions to be consumed elsewhere should be sold in the house or premises with respect to which such certificate is granted. The object of this portion of the enactment being to prevent grocers from becoming in reality the keepers of tippling-houses, those persons continued to be permitted to sell liquors by retail, provided that they were not consumed in their shops. In accordance with the principle of distinguishing between the different classes of houses in which the trade of a spirit-dealer should be carried on, three different grades of licences were introduced: those applicable, viz., 1, to inn or hotel keepers; 2, to public-house l and 3, to grocers and provision-dealers. As the first class, it is enacted that they sh 'keep open house, or permit or suffer any c in any part of the premises belonging the sell or give out therefrom any liquors befo o'clock in the morning, or after eleven o' night of any day, with the exception of ments to travellers, or persons requiring to the said house or premises; and further, th shall not open their houses for the sale liquors, or sell or give out the same on except for the accommodation of lodgers an *fide* travellers.' The same restrictions are on the second class of persons—viz., the ke public-houses, with this addition, that no ex is made in their case in favour of trave lodgers; whilst grocers and provision-dea addition to the prohibition to open on Sunda that already mentioned with reference to t sumption of spirits on the premises, are fo 'to sell or give out any liquors before six in the morning, or after eleven o'clock at Separate licences were also introduced for of malt liquors from those applicable to the wine and spirits, all of which had former included under one licence. By this statu for the first time in Scotland, the very for power was conferred on the police of ent any time any public-house, or house where ments are sold to be consumed on the premi penalties were awarded against those who re admit them, or who obstructed their entrance. provisions having given rise to much discu Royal Commission to inquire into the workin act was issued on the 25th April 1859. The r the commission was the issue, as usual, of tw mous volumes of printed evidence, and of a more distinguished for its length than for th of the suggestions which it contains. The c sioners arrived at the conclusion, that 'a intemperance still prevails to a lamentable it would seem that this vice has been for son gradually descending in the scale of socie that it is now chiefly confined to the lowe of the population.' This effect the commi ascribe to several causes, of which the fi most important is the increase of the d excisable liquors from 2*s.* 4¾*d.* per imperial g which it stood in 1823, to 8*s.*, to which finally raised in 1855. Nor do they deny Forbes Mackenzie Act its share of merit. 'Th ficial effect of the act,' they say, 'is proved evidence which we received as to the dimin crime, and the change for the better in the h the people, immediately after the passing of when its provisions were strictly enforced, the tendency in an opposite direction which places has followed its less rigorous enfor during the last two years. In some towns, th been, on the part of the magistrates, great ness in administering the law. The result to have been, if not an increase of crime i places, at least the absence of the impro witnessed elsewhere.' Whilst thus generally ing of the act, the commissioners suggest a of alterations, mostly with the view of e the police to carry out its provisions with efficiency. In reference to the difficulty expe by hotel-keepers in ascertaining what perso under the descriptions of *bonâ-fide* travell commissioners recommend that in future 'inducing hotel-keepers to sell or give ont e liquors to them on Sunday, by falsely repre themselves as travellers, should be guilty offence, and be liable, on conviction, to a fin

cumstances, it becomes important to know has been decided in England that to con- a 'traveller' within the meaning of the nding Act 18 and 19 Vict. c. 118, s. 2, it tter of indifference whether the parties be g for business or pleasure, and that a walk, drive, for exercise and amusement of such s to render refreshments desirable, is a suffi- rney. In Atkinson v. Sellers (5 C. B. N. S. ief Justice Cockburn remarked, that 'a man ot be said to be a traveller who goes to a rely for the purpose of taking refreshment. he goes to an inn for refreshment in the a journey, whether of business or of plea- is entitled to demand refreshment, and the r is justified in supplying it.' See also . Humphreys, C. P. 705; 4 L. T. N. S. 314. was in the case of a drive from Liverpool es, the second of a walk from Birmingham s.

BIDDEN FRUIT, a name fancifully given ruit of different species of *Citrus*. In the Britain, it is a small variety of the k (q. v.) which generally receives this name. the continent of Europe, a different fruit, by some as a variety of the orange, and by distinct species (*Citrus Paradisi*), is known 'orbidden Fruit, or Adam's Apple. Like er fruits of the same genus, it was recently d into the south of Europe from China. has broad, tapering, and pointed leaves, stalks winged; the fruit is large, some- ar-shaped, greenish-yellow, of very uneven having around its base a circle of deeper ns, not unlike the marks of teeth, to which ly owes its name. It is chiefly the rind the edible part; the rind is very thick, nelting, and pleasant; there is very little e pulp is acid.

me Forbidden Fruit has also been given to of *Tabernæmontana dichotoma*, a tree of of the natural order *Apocynaceæ*. The the fruit—which is a follicle, containing ggests the idea of a piece having been f, and the legend runs that it was good ve ate of it, although it has been poisonous e.

E; ENERGY. Till we know what Matter *if there be* matter, in the ordinary sense of , at all, we cannot hope to have any idea solute nature of force. Any speculations subject could only lead us into a train heses entirely metaphysical, since utterly he present powers of experimental science. ntent ourselves with a definition of force experience, such a definition will say of its nature, but will confine itself to the hich are said to be due to force, and in ent state of our knowledge it is almost ous to aim at more.

st ideas of force are evidently derived from tion required to roll, or lift, bend, or com- , some mass of matter; and it is easy to in all such cases where muscular contraction yed, matter is moved, or tends to move. en, we may say generally, is *any cause which , or tends to produce, a change in a body's state or motion.* See MOTION, LAWS OF. The r magnitude of a force may be measured in ro ways: 1. By the pressure it can produce, eight it can support; 2. By the amount of t can produce in a given time. These are espectively the Statical and Dynamical of force. The latter is, as it stands, some- nbiguous. What shall we take as the quantity of motion produced? Does it depend merely on the velocity produced? or does it take account of the amount of matter to which that velocity is given? Again, is it proportional to the velocity itself, or to its square? This last question was very fiercely discussed between Leibnitz, Huyghens, Euler, Maclaurin, the Bernoullis, &c.; Leibnitz being, as usual with him in physical questions, on the wrong side. Newton, to whom we owe the third law of motion, had long before given the true measure of a force in terms of the motion produced. This law is an experimental result—that when pressure produces motion, the *momentum* produced (see MOMENTUM) is proportional to the pressure, and can be made (numerically) equal to it by employing proper units. Hence momentum is the true dynamical measure of force, which, therefore, is proportional to the *first* power only of the velocity produced. What is properly measured in terms of the *square* of the velocity, we shall presently see. For various properties of force, statical and dynamical, see the following articles: COMPOSITION OF FORCES, COUPLES, CENTRE OF GRAVITY, CENTRAL FORCES, FALLING BODIES, MECHANICAL POWERS, VIRTUAL VELOCITIES.

It is obvious that in order to produce any effect at all, or to do WORK, as it is technically called, a force must produce *motion*, i.e., must move its point of application. A weight laid on a table produces no effect whatever unless the table yields to the pressure, i.e., unless the weight descends, be it ever so little. We do no work, however much we may fatigue ourselves, if we try to lift a ton from the floor; if it be a hundredweight only, we may lift it a few feet, and then we shall have done work—and it is evident that the latter may be measured as so many pounds raised so many feet—introducing a new unit, the FOOT-POUND, which is of great importance, as we shall shortly see, in modern physics. See WORK. This is evidently, however, a statical measure of work, since no account is taken of velocity. Have we then for work, as we had for force, a *dynamical* measure? Let us take a simple case, where the mathematical investigation is comparatively very easy, and we shall find we have. We know (see VELOCITY; MOTION, LAWS OF) that if a particle be moving along a line (straight or not), and the distance moved (in the time t) along the line from the point where its motion commenced be called s, its velocity is $v = \frac{ds}{dt}$. Also we know that the force acting on it (in the direction of its motion) is to be measured by the increase of momentum in a given time—this gives (just as the last equation was obtained) $F = m\frac{dv}{dt}$. From these two equations, we have, immediately, $mvdv = Fds$, or, as the rudiments of the differential calculus give at once, $\frac{mv^2}{2} = \int Fds = F.s$ if the force be uniform.

The quantity on the right-hand side is the sum of the products of each value of F, by the corresponding space ds, through which the particle moved under its action. It is therefore the whole work done by the force. On the left hand, we find half the product of the mass, and the square of the velocity it has acquired; in other words, the VIS-VIVA (q.v.). Hence, in this case, the vis-viva acquired *equals* the amount of work expended by the force.

It appears from a general demonstration (founded on the experimental laws of motion, and therefore true, if they are), but which is not suited to the present work, that if, in any system of bodies, each be made up of particles or atoms, and if the forces these mutually exert be in the line joining each

two, and depend merely on the distance between them, then we can express the required proposition in the following form:

Any change of vis-viva in the system corresponds to an equal amount of work gained or lost by the attractions of the particles on each other.

What is spent, then, in work, is stored up in vis-viva; and conversely, the system, by losing some of its vis-viva, will recover so much work-producing power. If we call the former, as is now generally done, *Actual*, and the latter *Potential, Energy*, we may express the above by saying, that in any system of bodies where the before-mentioned restrictions are complied with, *the sum of the actual and potential energies cannot be altered by the mutual action of the bodies.* The most simple and evident illustrations of this proposition are to be found in the case of the force known as gravitation. The potential energy of a mass on the earth's surface is zero, because, not being able to descend, it has, in common language, no work-producing power. If it be raised above the surface, and then dropped, it is easy to see that the work expended in raising it will be exactly recovered as vis-viva after its fall. For (see FALLING BODIES) a mass falling through a space, h, to the earth acquires a velocity v, such that $v^2 = 2gh$, or if m be the mass, $\frac{mv^2}{2} = mgh$. The left-hand side gives the vis-viva acquired by the fall—the right is the product of the weight (mg) and the height fallen through—or is the work required to elevate the mass to its original altitude.

Hence we may calculate the amount of work which can be obtained from a *head* of water in driving water-wheels, &c., remembering, however, that there is always a *loss* (as it is usually called) due to friction, &c., in the machinery. That there is a loss in useful power, is true, but we shall find presently that in energy there is none, as indeed our general result has already shewn. *Where* the apparently lost energy goes, is another question.

Another good example of potential energy is that of the weights in an ordinary clock. It is the gradual conversion of potential into actual energy in the driving weight which maintains the motion of the clock, in spite of friction, resistance of the air, &c.; and we have in the actual energy of sound (which is *motion*) a considerable portion of the expended potential energy of the striking weight. A coiled watch-spring, a drawn bow, the charged receiver of an air-gun, are good examples of stores of potential energy, which can be directly used for mechanical purposes.

The chemical arrangement of the different components of gunpowder, or gun-cotton, is such as corresponds to enormous potential energy, which a single spark converts into the equivalent active amount. But here, *heat* has a considerable share in the effects produced; it may then be as well, before proceeding further, to consider how we can take account of it, and other physical forces, as forms of energy.

Correlation of Physical Forces.—So far as we yet know, the physical forces may be thus classified: I. GRAVITATION (q. v.); II. MOLECULAR FORCES—COHESION (including CAPILLARITY), ELASTICITY, CHEMICAL AFFINITY; III. HEAT AND LIGHT; IV. ELECTRICITY (including MAGNETISM); V. ANIMAL FORCE; VI. VITAL FORCE, having, as some most irrationally suppose, an analogue in inorganic masses, which may be called Crystalline Force. (This idea is examined further on.) Of these, I., II., and some forms of III., are more immediately connected with *matter* than the others—that is to say, that the remainder almost necessitate the hypothesis of the existence of some medium unlike ordinary matter, or, in popular language, an *imponderable*. The a universal opinion of physicists, however, seer be, that even the former must be accounted some such way. Newton, in his second lett Bentley, says, with respect to gravitation (a is obvious that similar language is applicab molecular forces generally): 'You sometimes of gravity as essential and inherent to m Pray, do not ascribe that notion to me, for cause of gravity is what I do not pretend to k And again in the third letter: 'It is inconcei that inanimate brute matter should, withou mediation of something else, which is not mat operate on, and affect other matter without m contact, as it must do, if gravitation, in the of Epicurus, be essential and inherent in it; this is one reason why I desired you would ascribe innate gravity to me. That gravity sl be innate, inherent, and essential to matter, so one body may act upon another at a dis through a *vacuum*, without the mediation of thing else, by, and through which their actior force may be conveyed from one to another, me so great an absurdity, that I believe no who has in philosophical matters a comp faculty of thinking, can ever fall into it. Gr must be caused by an agent acting consti according to certain laws; but whether this a be material or immaterial, I have left to the sideration of my readers.' Of what that me may consist, we cannot, of course, hazard ev conjecture; but if it be composed of separate a — i. e., not continuous—it is evident that a se medium will be required to help the particle the first to act on each other (for without this first medium would be merely obstructive), an on. This must stop somewhere; why not, the the first? But in the present state of our kn ledge of mechanics, a continuous medium is be conceivable, and its motions, &c., present consi able difficulties to even plausible mathema treatment. If we take the view opposed to N ton's, as Mosotti and others have done (their i are considered further on), we can, in a very ficial manner, however, account for gravitation molecular action; but, as before said, the fou tions of this attempt at explanation are ha tenable.

Just as sound depends on the elasticity of air and vibrations thereby maintained and pr gated, light and radiant heat, which are certa identical, most probably consist in the vibrat of some very elastic fluid. This has been pr sionally named Ether (q. v.). If it be continuou may help us to account for the first two categ of force also, as we have already seen; if not s is more likely, fresh difficulties arise. Light heat, however, are undoubtedly forms of mo and correspond, therefore, to so much vis-viv actual energy. Even heat in a liquid or solid b must correspond to some vis-viva in the mat particles, since a hot body can give out both l and heat, and a body may be heated by luminou calorific rays which are vibratory, as we have se

Class IV. contains perhaps the most puzzlin all these forces. That there is something in c mon in all the forms of electricity, and that m netism is nearly related to them, is certain; i probable, also, that frictional electricity, when e ical, consists in something analogous to a co spring, or is a form of potential energy—the ot being forms of actual energy. Some have supp magnetism to be also a form of potential ene but Ampère's discoveries have materially less the probability of the truth of this hypothesis. shall consider this again.

V. may be deferred for the present.
Class VI., it seems, from the observations of

se experimental results, then, consists what
the Correlation of the Physical Forces—
i.e., the transmutability of one of the latter into
another or others. The idea is old, but the proofs
of its truth have only become numerous within
the last half-century. Grove has published an
excellent treatise with the above title; to this
we refer the curious reader for further detail on
this interesting subject.

Conservation of Energy.—But a far more important principle, being, in fact, the *precise* statement of the preceding—which is somewhat vague—is that of the Conservation of Force, or rather Energy. It is simply the extension (to all the physical forces) of the principle which we have given in full, and proved in a particular case, at the beginning of this article—i.e., that the sum of the potential and actual energies of any set of moving bodies cannot be altered by their mutual action. Let us now suppose heat, light, &c., to consist in vibratory movements of particles, and in their relative states of distortion, &c., and make the supposition that these particles act on each other—no matter by what means—in the line joining each two, and with forces which depend on their distance, and we have at once the theorem, that the sum of the potential and actual energies is a quantity unalterable in any system, save by external influences. Hence, when mechanical power is said to be lost, as it is by the unavoidable friction in machinery, &c., it is really only changed to a new form of energy—in general, heat. Thus, when a savage lights his fire, he expends animal force in rubbing two pieces of dry wood together. If these pieces of wood were not in contact, no force would be required to move them past each other—more and more is required as they are more strongly pressed together. The equivalent of this force so expended is found in the heat produced. Davy shewed that two pieces of ice might be melted by rubbing them together. A skilful smith can heat a mass of iron to redness by mere hammering. Here the actual energy employed is partly given out in the shape of heat, and partly stored up in the iron as potential energy due to the compression of the mass, or the forcible approximation of its particles. Amongst the earliest, and certainly the *best* experiments on this subject, are those of Joule (q.v.). He determined the relation between the units of heat and potential energy of gravitation, by various methods, which gave very nearly coincident results. One of these we may mention. A paddle-wheel is so fixed as to revolve in a closed vessel full of water. The wheel is driven by the descent of a known weight through a measured space, and precautions are taken against losses of energy of all kinds. The water agitated by the paddle-wheel comes soon to rest, as we know; but this is due to friction between its particles; and the final result is the heating of the water. The quantity of water, and also the number of degrees by which its temperature is raised, being measured, a simple proportion enables us to find how many foot-pounds (see FOOT-POUND) of mechanical energy correspond to the raising by one degree the temperature of a pound of water. The result is, that the heating a pound of water one degree Fahrenheit is effected by 772 foot-pounds and this number is called Joule's Equivalent. In other words, if a pound of water fall to the ground through 772 feet, and be then suddenly arrested, its temperature will be raised one degree; and, conversely, the heat that would raise the temperature of a pound of water one degree, would, if applied by a steam-engine or otherwise, raise 772 pounds one foot high. Now (see HEAT OF COMBINATION), we know the amount of heat which is produced by the burning (in air) of any material whose composition is known.

It follows, then, that from the mere quantity and composition of a substance, we can tell the amount of mechanical work due to its combustion; that is, supposing it all to be effective. As we have been led to the mention of heat of combustion, let us consider what this is due to. Combustion (in air) is merely a chemical combination of the constituents of the burning body with oxygen—the heat and light which are developed are therefore, by the conservation of energy, equivalent to the excess of potential energy of the uncombined, over the combined, oxygen and combustible.

That this is the real state of the case—and that the original setting fire to the combustible has nothing to do with the matter, as is frequently imagined—will be made evident by considering any spontaneous combination, say that of chlorine and copper filings, or of mercury and sodium, &c., in which cases the potential energy lost by the compound appears as heat, light, and sometimes sound.

The equivalents of the other physical forces have not been even approximated to, with the exception of that of light. Thomson has determined the energy of a cubic mile of sunlight at the earth to be somewhere about 12,000 *foot-pounds*, giving about 10,000 as the *Horse-power* (q. v.) of each square foot of the sun's surface. There are some additional difficulties in the way when we seek the equivalent of electricity, for here the question arises: 'Is there a special substance which is, or whose motions are, electricity, or is it merely another mode of motion of the luminiferous ether?' for we can scarcely suppose it to be due to motions of the particles of *matter*. If the first, we have as yet no means of estimating its energy; if the latter, we may consider it as within the reach of experiment. It may merely be remarked here, that Weber's exquisite theoretical statement of dynamical electricity —resting on the fundamental assumption that there are two *electric fluids*—requires the admission of mutual forces, which vary with the relative velocity of its particles, and for which, therefore, the conservation of energy does *not* hold.

Heimholtz, in an admirable paper (*Ueber die Erhaltung der Kraft*, translated in Taylor's *Scientific Memoirs*, New Series, i.), starting from the assumptions above explained, has applied the principle of conservation of force to the investigation of many recondite problems connected with most of the physical forces. We cannot, of course, enter into his work in detail, as it is somewhat analytical, but we may freely borrow such of its contents as we have not already alluded to, at least such as will suit the plan of this article.

A very good example of the conservation of energy is found in the increasing velocity of a planet or comet as it approaches the sun, and thus loses potential energy; and also in the fact, that in the case of these bodies the mere distance from the sun, and the velocity at that distance, enable us to tell at once the nature of the orbit described—i. e., which of the conic sections it is.

Latent heat is a form of potential energy, depending on the physical state of the substance in which it is stored up. The same may be said of those substances which, when mixed, produce heat or cold, as water and sulphuric acid, or nitrate of ammonia. It is easily seen that here the heat or cold depends upon a change of molecular arrangement of some kind; that is, a change of the potential energy.

In magnetism and statical electricity, of course, the conservation of energy holds, as we know that all the phenomena can be explained by attractions and repulsions, following the law of gravitation. In the discharge of a Leyden battery, the potential energy lost is reproduced as heat in the connecting wires, and as light, heat, and sound with the disruptive spark. In charging a Leyden jar by means of the electrophorus, the charge is directly produced by the expenditure of mechanical force in overcoming the attraction of the negative electricity of the resinous plate for the positive electricity of the cover.

In the ordinary voltaic battery, the excess of loss of potential energy in the cells, by the chemical union, say of zinc and oxygen, and of sulphuric acid and oxide of zinc, over that gained by the decomposition of water, produces the actual energy of the current, which may be transformed into heat, light, magnetism, or motion, or two or more. Or it may be employed to reproduce potential energy by chemical decomposition, say that of water. This again, by a spark, can be reconverted into actual energy as an explosion accompanied by heat, light, and sound. When an electric current causes the motion of a magnetised needle, our general principle should lead us to infer that the current itself will be weakened. This is found to be the case, but, as it should be, *only during the motion* of the needle. The needle in a permanent state of deflection produces no effect whatever. Now, the diminution of an electric current is simply equivalent to the addition of a weaker current passing in the opposite direction. We should expect, then, that the motion of a magnet near a conducting wire will in general produce a current in the latter, and this is, in fact, Faraday's great discovery of magneto-electric induction. In this case, the current ceases so soon as the magnet ceases to move relatively to the wire.

If a mass of copper or other good conductor be set in rapid rotation near a powerful magnet, the motion produces electric currents in the copper, which, being attracted by the magnet, soon bring the mass to rest. It is not so clear in this case into *what* the mechanical energy of the rotation has been transformed, especially as the electric currents cease with the motion; but if we keep up the rotation forcibly, we find in a short time the copper growing warm; in other words, the motion has been transformed into electricity, and the latter into heat. This very beautiful experiment is due to Joule, and has been repeated in a striking popular form by Foucault.

Advantage has been taken by Faraday of the phenomena of induction, to produce electric currents by aid of the earth's magnetism. His apparatus is simply a revolving disc of metal, and the terminal wires touch, one its axis, the other its edge. The force which is here transformed into electricity is the additional effort requisite to turn a *conducting* disc, instead of an equal *non-conducting* one. It is a curious consequence that in all metallic machinery a portion of the energy of the prime mover is lost in producing electricity, and finally heat, in the moving parts, so that heat in such cases is not entirely, though very nearly, due to friction alone.

Perhaps one of the most singular of these transformations of energy is that already referred to of heat into electricity. Certain crystals, such as tourmaline, become electrified by heat; but electric *currents* can be produced by simply heating a *junction* of two wires or bars of different metals, the other ends also being in contact. Now, if we were to heat the other junction, it is obvious that as at it the metals are arranged in the opposite order, we should produce a contrary current; conversely, by cooling them we should strengthen the first. But the conservation of force requires that such a junction should be heated or cooled according to the direction in which a current passes through it. This was discovered by Peltier.

Animal force, again—or rather its actual energy —is simply a transformation of the potential energy

This is well illustrated by the increased
ch is required when man or beast abruptly
from a state of inactivity to one of toil, as
olar bear after his winter's sleep; or by the
amount and better quality of food which
ssary for criminals subject to hard labour,
those who are merely imprisoned.

then, as far as we have yet seen, there is
thing as gain or loss of energy anywhere,
appears that the ultimate transformation of
ergy is heat, and that the latter tends to
n diffusion or dissipation, in which it is
ble, as far as we know, for further trans-
n (see HEAT), whence do we procure the
of energy which are requisite to maintain
omy of life? We answer: Chiefly, or indeed
from the sun, whence they come as light and
eat, perhaps in other forms. Without the
re would be vegetation?—without the latter,
nimal life? Where would be our stores of
ether wood or coal? It is entirely, then,
ssay, to the directly supplied energy of the
we look for the maintenance of life; and this
a question not of much importance to our-
be sure, but of vast future consequence to
an race: Is this supply finite? Will the
ime have given off all its energy, or is it
lly receiving accessions itself, and if so, has
xhaustible store to draw from?

whether the sun be a hot mass, or be sur-
by an atmosphere in an intense state of
ion, or whether it derives the main part of
, as Thomson supposes, from gravitation
y presently to be considered), it is certain
far as we know, it must at some period
usted. Such is the apparently inevitable
of the conservation of energy.

ravitation theory of the origin of energy
may be given in some such form as this:
tter in the universe, in a state of coarser
division, originally filled all space, and
l, therefore, by virtue of gravitation, a
mount of potential energy. As particles
y moved up to each other, and became
gglomerated into masses, more and more
ergy was realised in its actual form; some
(that of the sun, or the internal heat of the
), some as vis-viva of axial or orbital rota-
. There still remains unagglomerated in
e ZODIACAL LIGHT, AEROLITES, NEBULÆ)
f this original matter still falling mainly
the larger masses, as the sun and stars, and
ng its potential for actual energy. But the
we have seen, tends ultimately to become
l to seek a uniform diffusion. This, then, it
is to be the last scene of the great mystery
niverse—chaos and darkness as 'in the
g.'

mediate consequence of the truth of the
tion of energy is the impossibility of what
y understood by Perpetual Motion (q. v.);
to be carefully remembered that perpetual
in the literal sense of the words, is not
sible, but very general. If there were no
ng as friction, or if we had a perfectly
ely, in the form of a tectotum, for example,
spin for ever in vacuo with undiminished
The earth in its axial rotation affords a
mple. Were it a perfect sphere, and of
material, the other masses of the system
duce no effect whatever on its rotation,
latter would, as indeed it does, as far as
letermine, remain for ever unchanged. And
we have already seen, when one motion, as
y, or ordinary vis-viva, is lost, we find it
ing in other forms of motion, such as heat
and light. But this is not the technical acceptation of the term, perpetual motion; it is popularly understood to mean a source of motion which will not only preserve its own vis-viva unchanged, but also *do work*. This is, of course, incompatible with the conservation of energy, for wherever work is done, equivalent energy in some form or other is consumed. As we have not, however, an absolute *certainty* of, though very powerful evidence indeed for, the truth of the principle, it would be unphilosophical to conclude that perpetual motion is absolutely impossible. It is certain, however, that it cannot be attained by any mechanical arrangement; and neither heat, light, nor magnetism can give us any assistance. If we knew more than we do at present about electricity, we should probably add it also to the category. The ordinary attempts which are still being made in thousands by visionaries, are simply absurd, based as they are for the most part on ignorant applications of mechanics. There is absolute impossibility here; and a 'perpetual motionist' of the common herd is far more infatuated than a 'squarer of the circle;' for the latter's problem *may* be solved, though certainly not by the means usually employed, or in the form usually sought for.

We may now briefly consider the theories of the physical forces which have been advanced of late times, and we may take such as are worth notice together. All of them assume at the outset forces of attraction or repulsion between particles, or else a highly elastic fluid, or rather solid, if we may so call it, in which the particles of matter float, or are imbedded. We have already considered the difficulties attending the latter supposition; but it is the only one which does not refer force back to force, thus apparently leaving the question where it found it. We may dismiss it with the remark, that a fluid or quasi-solid absolutely continuous and alike in every part is difficult to conceive; and it is hard to understand how motion can be propagated through it. If it be not continuous, forces must be supposed to be exerted by its parts on each other, else the motion of one part would not affect the others. There is one way in which the latter difficulty has been attacked, which seems plausible enough; and that is, that the particles of this fluid are in a state of rapid motion, and continually impinging on each other and on the particles of matter, no forces being exerted except those of pressure at the impact. But, unless these particles be supposed *elastic*, and what is elasticity but a form of molecular force (*force again*), their motion would be lessened at every impact, and destroyed completely if the impact were direct. This objection seems to be a very strong one. The first-mentioned theory, that of Epinus and Mosotti, assumes that material particles float in a general atmosphere of ether, that the particles of each repel one another, but that a particle of matter attracts one of ether. From these suppositions, and an hypothetical law connecting pressure with density in such an ether, Mosotti has deduced gravitation and the molecular forces; but to apply the hypothesis to the other physical forces, other suppositions are necessary. These have been supplied by Clausius and Redtenbacher, who, with the assumptions of particles of matter and of ether as before, imagine those of matter to attract each other, and also those of ether, but the latter to be mutually repulsive. Light and radiant heat, according to this theory, are vibrations of the ether which fills all space between the particles of matter, or rather, between the atmospheres of ether which, by the foregoing assumptions, the particles of matter will collect about them. Heat consists of vibrations of the

molecules of matter, or of the groups of atoms (see ATOMIC THEORY) of which the molecule of a compound body is built up, together with their atmospheres. Electricity, magnetism, &c., are explained to be rotations in the atmospheres. Redtenbacher and Clausius are not quite agreed as to the physical forces corresponding to each of these forms of motion, but the above sketch will give a general idea of the nature of their speculations.

But the most startling of all the reflections on force, and its ultimate nature, which have perhaps ever been made, are those of Faraday. Without calling in question in ordinary cases the truth of the conservation of energy, he has endeavoured, by experiment (the only genuine test in a question so novel and so profound), to prove what may be called the Conservation of Force, if we understand *force itself*, and *not energy*. He argues thus: two masses, according to the undisputed law of gravitation, attract with four times their mutual force if their distance be diminished to half; and with only one-fourth of the same, if their distance be doubled. He asks *whence* comes the additional force in the former, and *what becomes of* the lost force in the latter case?

Now, it is evident that this is a new question, totally distinct from any we have yet considered. To answer it, we must know *what* force is. Would gravitation have any existence if there were but one particle of matter in the universe, or does it suddenly come into existence when a second particle appears? Is it an attribute of matter, or is it due to something between the particles of matter? Faraday has tried several experiments of an exceedingly delicate kind, in order to get at some answer to his question. A slight sketch of one of them must suffice. A pound-weight is not so heavy at the ceiling of a room as it is when on the floor; for, in the former case, it is more distant from the mass of the earth than in the latter. The difference for a height of 30 feet is (roughly) about $\frac{1}{330,000}$th of a pound. Now, if a mass of metal be dropped through such a space, an additional force, $\frac{1}{330,000}$th of its weight, is called into play, and the object of the experiment was to detect whether electrical effects accompanied this apparent *creation* of force. The mass, therefore, was a long copper wire, whose coils were insulated (see ELECTRICITY) from each other, and whose extremities were connected with those of the coil of a delicate Galvanometer (q. v.). Had any trace of an electric current been produced, the needle of the galvanometer would have been deflected, but, when all disturbing causes were avoided, no such deflection was detected. Other experiments with a view to the detection of other physical forces, were also tried, but, like the first, with negative results only. We must not, however, conclude that such can never be found, as this would be assuming the absolute truth, in all cases, of the conservation of energy, which is no doubt thoroughly borne out by experiment in many cases, but not even approximately in others; while even in the former class more delicate instrumental means *may* enable us to trace small but most important deviations from absolute exactness; and it is to the results of such trials that we must look for further information as to the *nature* of force, and the generality of the law of conservation of energy.

There are, in mechanics, several other quantities which retain a fixed value under certain circumstances. We may briefly consider a few of them.

Conservation of Areas. Invariable Plane.—We have seen (CENTRAL FORCES) that if a particle move about a centre of force, its motion is confined to a plane, and its radius vector traces out equal areas in equal times. Similar theorems hold in any system of particles acted on only by their mutual attractions. If in such a system we suppose the positions of the respective particles to be continually projected (orthogonally, see PROJECTION) on *any* fixed plane, and radii vectores to be drawn from *any* point in that plane to the projections—*the sum of the areas swept out by all those radii vectores will be equal in equal times.* Also, this being true of all planes, there is one for which this sum is a maximum, and *this plane is fixed in space.* It is thence called the invariable plane of the system. Similar propositions hold for a system of bodies each of finite size, their several axial rotations being taken into account; hence what is called the Invariable Plane (q. v.) of the Solar System.

Conservation of Momentum.—When two masses attract or impinge, the forces they exert on each other are evidently equal and opposite. Now, the measure of a force is the momentum it produces; hence equal and opposite momenta, in addition to their original quantities, will be communicated to the masses, and therefore the sum of the momenta of the two, resolved in any direction, will be unaltered; hence, *the sum of the momenta of any number of bodies will be unaltered by mutual actions either of the nature of attraction or impact.*

Conservation of the Motion of the Centre of Gravity.—Again, in such a system, the momentum of the centre of gravity of the whole in any assigned direction is the sum of the momenta of the separate bodies in that direction; hence, *the centre of gravity of a system, subject to none but the mutual actions of its components, either remains at rest, or moves uniformly in a straight line.*

FORCE AND FEAR. As consent is of the essence, or rather is the essence of all contracts, and as consent implies not only intelligence, but unfettered power of action in the consenting parties, contracts, by the laws of all civilised nations, will be invalidated if it shall be proved that they were entered into under the influence of force or fear. Circumstances which constrain the will have the same effect as those which blind the understanding, and the law of force and fear is consequently closely analogous to that of Fraud (q. v.), including under that head misrepresentation, concealment, and consequent Error (q. v.). But it is not every degree of constraint, however exercised, which will have this effect in law. On the contrary, it must be of such a description as may be reasonably supposed to influence the will of the party in the circumstances in which he is placed at the time. In determining, therefore, whether there really has been force or fear in the legal sense, the law will take into account the age, sex, education, and other personal characteristics of the party, along with the accidental circumstances in which he was placed, e. g., the state of his health and spirits at the time, whether he was alone, what anxiety he may have felt for the life or interest of others, and the like. But 'where there is no peculiar weakness of age or sex, or condition,' says Mr Bell, stating in this respect not the law of Scotland alone, but of most other countries, 'law will require, in order to annul a contract, such fear and compulsion as may reasonably shake a mind of ordinary constancy and resolution, and will not listen to the pretence of every vain and foolish fear.'—*Com.* i. p. 22, Shaw's ed. As a contract which is invalid on the ground of force and fear is not only incapable of being enforced after its invalidity has been ascertained by legal process, but from the absence of consent was invalid *ab initio*—i. e., no contract, in a legal sense, at all—the object of the law is to restore the parties to the position in which they were before it was entered into. All moneys which have been paid under the provisions of the extorted contract must

ntly be repaid, and reparation in as far as must be made by the payment of damages personal injuries as the party who was into it may have suffered from the enforce- its provisions. See REDUCTION. By the ngland, Duress (q. v.) which will invalidate ct must amount to fear of the loss of life (Mayhem, q. v.). 'Whatever is done by a save either life or member,' says Black- is looked upon as done upon the highest r and compulsion. Therefore, if a man, fear of death or mayhem, is prevailed upon te a deed, or do any other legal act, these, accompanied with all other the requisite ies, may be afterwards avoided.' But 'a battery or being beaten, though never so unded, is no duress; neither is the fear of one's house burned, or one's goods taken d destroyed, because in these cases, should at be performed, a man may have satisfac- recovering equivalent damages.'—Stephen's p. 142. The avoidance of such a contract ver, dependent on the will of the injured 'A contract made under duress may be by the person whose free-will was thus d, though he has also an election, if he roper, to insist upon it as a binding trans- *Ib.* vol. ii. p. 62). But the parties who are to treat a contract either as a nullity or a g contract, must make their election, and after treating the contract as rescinded, set a subsisting contract (Addison on *Contracts*, 436, and 1074).

CELLINI, EGIDIO, an Italian philologist of ainments, was born on the 26th of August a village near Padua. Owing to the limited f his family, F. was deprived of the benefit instruction, and was already verging towards l when enabled to commence a regular of study in the seminary at Padua. His industry, combined with unusual powers of , singled him out from his companions, the admiration of the learned principal, Facciolati, who even associated him with f his own scientific labours. The pupil his teacher valuable service in the com- of a highly important lexicon, a work robably inspired both with the project on 's literary repute is based—viz., the com- of a vast and comprehensive vocabulary of n language. The work was published after th, and pronounced by public voice as one most valuable acquisitions to philological of the age. In addition to the Italian and gnification of the Latin word, the literal and e application of each expression is given in tion of examples, in themselves a perfect lium of knowledge, embracing the customs, ts, sciences, religion, and history of the . This immense work was published in 4 io, under the title, *Totius Latinitatis Lexicon, et cura Jac. Facciolati, opera et studio Aeg. ti Lucubratum* (Padua, 1771). Furlanetto's s appeared in 1816 (Padua), and a new of the complete work was published in dua). F. died in 1768.

CENÉ. said, in Heraldry, of a horse when or standing on his hinder legs.

CEPS (Lat. a pair of tongs or pincers), the ven by surgeons to an instrument of great y, used as a substitute for the fingers, and ng of two levers of metal jointed together e, nearer to one end than the other. The asping the longer ends of the levers or closes the shorter ends, which are shaped so as to seize firmly the intended object. There is scarcely a surgical operation in which it is not applied; and it is made of various forms, to suit different cases. In addition to the forms used in Dentistry (q. v.), there is, e. g., the *dissecting* forceps, which has roughened points, to lay hold of small portions of tissue which are to be divided by the knife; the *lithotomy* forceps, again, has blades concave like spoons; and *fenestrated* forceps have apertures in the blades, and as the soft tissues project into these, a firm hold is obtained with less risk of tearing the parts. By means of Liston's *cutting* forceps, a powerful hand can divide a great thickness of bone. But the most important of all is the *midwifery* forceps, an invaluable invention, in cases of difficult delivery, which daily rescues from suffering and danger numerous mothers and infants. It was gradually brought to its present perfection; but the name of Chamberlen, an accoucheur of the time of James II., is associated with it, as one of its chief improvers. It consists of two concave fenestrated blades, forming a cavity into which the head of the child fits. The blades are applied separately, one to each side of the head, and then locked together. Holding by the handles, the accoucheur aids the natural efforts of labour. The instrument does not necessarily or generally injure either mother or child.

FORCING, in Gardening, is the artificial application of heat to accelerate vegetation. The term is not usually applied to the cultivation of exotic plants in hothouses, where the object is to imitate as much as possible their native climate; but it is strictly applicable to the system usually pursued with vines and pine-apples, to secure the production of fruit at desired seasons, and by different plants of the same kind in succession through a considerable period, the heat being increased for one set of plants sooner than for another. Many of the fruits and vegetables which grow well in the open air, are very commonly *forced*, in order that they may be procured at seasons when they could not without artificial means. Thus, sea-kale and rhubarb are forced by means of the heat produced by heaps of fermenting litter, by which at the same time they are blanched, and to this we owe their appearance in the market very early in the season. Potatoes, pease, kidney-beans, asparagus, salads, &c., are often forced by means of hotbeds, or in lined pits; or a place is found for them in hothouses. Strawberries are cultivated in pots, and forced in hothouses; and some kinds of fruit-trees are often treated in the same way, particularly cherries; and very diminutive trees may be seen richly loaded with fruit. Certain varieties are regarded by gardeners as particularly suitable for forcing. The system pursued in the Orchard-house (q. v.) cannot be called forcing.

FORD, FORDING. When a river or rivulet is crossed without the aid of either a bridge or ferry, it is said to be forded, and an established place for this crossing is called a ford. Thus, we have Oxford, Stratford, Deptford, Hungerford, &c., towns built around ancient fords. To the military engineer and the traveller in wild countries, the selection of the safest place for fording a river is a matter of some practical importance. In the first place, the *widest* part of the river should be chosen, as, wherever a certain quantity of water is flowing, the wider its bed—the rapidity of the flow being the same—the shallower it must be. At the bend of a river, the line of shallow water does not run straight across, but extends from a promontory on one side to the nearest promontory on the other. The stream usually runs deep along

hollow curves, and beneath steep perpendicular and overhanging banks, whilst it is always shoal in front of promontories, unless the promontory is formed by a jutting rock. For safe fording on foot, the depth of water should not exceed three feet; on horseback, four feet; or a foot less for each, if the current be very strong. The bottom of a ford should be firm and even; weeds, blocks of stone, &c., are serious obstacles, especially for cattle. When a caravan, a number of troops, or of cattle, have to cross, a sandy bottom is very bad, for the sand is stirred up and carried away by the stream, and renders the ford impracticable for the hindmost. For a small party, hard sand or gravel is the safest bottom.

The inhabitants of a district generally know the safest fords, and their experience affords a better guide than the best rules that can be given. Fords are continually varying, either from the swelling of the river or the shifting of its bed or banks, and therefore it does not follow that the place set down by one traveller as a safe ford, will continue so for the next that succeeds him.

FORD, JOHN, an English dramatist, was the second son of Thomas Ford of Ilsington, in the county of Devon. The date of his birth is not known, but he was baptized in Ilsington Church, 17th April 1586. His family was connected with the famous Lord Chief Justice Popham, and he became a member of the Middle Temple in November 1602; his cousin, a John Ford also, at the same period being a member of Gray's Inn. Unlike many members of the poetic tribe, F. seems to have adhered to his studies, and to have attained some professional success. His first poem was an elegy on the death of the Earl of Devonshire, entitled *Fame's Memorial*, and subsequently he assisted in the composition of various plays; perhaps, from his conjunction with Webster and Decker, in this way he acquired, or at least whetted, his appetite for tragic horrors. In 1629, he produced *The Lover's Melancholy;* and four years after, *The Broken Heart*, and *Love's Sacrifice*. Next year came *Perkin Warbeck;* and in 1638–1639, *The Fancies Chaste and Noble*, and *The Lady's Trial*. After this, F. drops out of literary history. Some think that he died soon after; others, that he retired to his native place, married, and lived to an old age, with sons and daughters growing up around him.

F. takes high position as a dramatist, and this position he attains more by general mental force than by dramatic instinct, or by what we are accustomed to call poetic genius. In his compositions, there is a sense of effort; his writing looks like task-work; and one can hardly suppose that he enjoyed his work. His versification—even when the subject-matter is distinctly noble is hard and prosaic. He has no humour. He has been praised for his pathos, but in his pathetic scenes effort is apparent. He cannot 'flatter' you to tears, as Shakspeare and the greater poets do. An edition of his works, published by Edward Moxon of London (1840), is enriched by a biographical notice and critical estimate from the pen of Hartley Coleridge.

FORDUN, JOHN OF. Nothing more is certainly known of this early Scottish chronicler, than that he was a secular priest, and wrote about the year 1380. It has been inferred from his name that he was born at Fordun, in Kincardineshire, and it has been said that he was a canon of the cathedral church of Aberdeen. Having proposed to himself the compilation of a chronicle of Scotland, he is said to have travelled on foot through Britain and Ireland in search of materials. He lived to write only five books of his *Scotichronicon*, bringing the history down to the death of King David I. in 1153. He left collections extending to the year 1385, about which time he is supposed to have died. The work which John of F. had left unfinished was resumed in the year 1441 by Walter Bower, abbot of the monastery of Austin Canons Regular, at Inch Colm, or St Colm's Inch, in the Firth of Forth. He enlarged the five books which F. had completed, and making use of his collections so far as they went, wrote eleven new books, bringing the *Scotichronicon* down to the murder of King James I. in 1437. The dearth of other annals has given more importance to the work than it could claim from its literary merits, which are scanty enough. It has been printed more than once, the most complete edition being Walter Goodall's, published at Edinburgh in 1759, in two folios. This includes both F. and Bower. The best edition of F.'s work, as it was left by himself, is Thomas Hearne's, published at Oxford in 1722. There is room for a new edition, which should give a collation of the best manuscripts, and distinguish what is F.'s own, what he copied from others, and what Bower interpolated into his text.

FORE (i. e., first), a term applied to the front or foremost part of a ship. The *forehold* is that part of the hold intervening between the cutwater and the foremast. The *forecastle* is that portion of the upper deck extending from the foremast to the bow; it is the part to which the common sailors have free access, and probably derives its name from a small turret or castle placed near the prow in ancient vessels, from which darts and other projectiles could be most conveniently hurled upon an enemy. *Foremast* is the first of the three masts, or of the two, when only that number are present. It is surmounted by the foretop-mast, foretopgallant-mast, and foreroyal; its sails being foresail, foretopsail, &c.; between it and the bow flies the forestaysail, hoisted on the forestay, a massive rope passing from the foretop to the bow, and, with the backstays and shrouds, maintaining the mast in a perpendicular position. The *forebraces* are ropes passing from the extremities of the foreyard into the maintop, whence they descend through pulleys to the deck, where they serve, when necessary, to alter the direction presented by the foresail to the wind.

FORECLO'SURE, in English Law, the process by which a mortgagor failing to repay the money lent on the security of an estate, is compelled to forfeit his right to redeem the estate. Every person having mortgaged his estate, is entitled to an equity of redemption, which can only be cut off by a formal process. For this purpose, the mortgagor files a bill of foreclosure, praying that an account may be taken of the principal and interest due under the mortgage, and that the mortgagor, on failing to pay, may forfeit his equity of redemption. If on the day fixed for payment, the money be not forthcoming, the mortgagor will be declared to have forfeited his equity of redemption, and the mortgagee will be allowed to retain the estate in perpetuity. See MORTGAGE.

FOREHAND RENT. In Scotch Law, rent is said to be forehand when it is made payable before the crop, of which it is the rent, has been reaped. After the period when it is due and exigible, forehand rent is *in bonis* of the lessor, and passes to his executor, not his heirs (Bell's *Law Dictionary*).

FO'REIGN ATTA'CHMENT may have reference either to person or property. A defendant who has been arrested or attached in a foreign country, may be again arrested in England on the same ground of action. Thus, where a defendant had been arrested abroad on an English judgment, and

and came to England, the Court of Queen's ecided that he may be holden to bail in an n the judgment. But after an arrest in r Scotland, the defendant cannot, in general, arrested in England for the same debt, f these countries being deemed foreign to ct (Wharton's *Dic.*). Under the same name, ding for securing the debts due to the it has been immemorially used in the cities on and Bristol (Stephen's *Com.* iii. p. 663, d by the C. L. P. Act of 1854, a similar pro- has been adopted, but with this difference, reas by a foreign attachment in the Lord Court, debts are attached for the purpose elling the defendant to appear and put in ie action, no such proceeding can take place ommon-law courts till after judgment. See MENT. In Scotland, where a creditor may arcerate a debtor and attach his effects, sh creditor may attach the property of his hough he has imprisoned him in England. ACHMENT, APPREHEND, ARREST, FOREIGN

The corresponding phrase in Scotland is *nt*, which has reference both to person ds, and is a proceeding at common law le to the whole country. As to the validity otch arrestment, *ad fundandam jurisdic-* to enable the Scotch courts to proceed a foreigner though absent, see the recent ase of the London and North Western Co. v. Lindsay, Macqueen, iii. p. 99.

EIGN AUXILIARIES. In the early of English history, foreign auxiliaries were neans uncommon. Harold had a body of his army when he defeated the Norwe- g; and to their refusal to march against red Normans he owed not the least among plications which ultimately overwhelmed assing to modern times, William III. had time a body of Dutch troops in his pay as England: throughout the 18th c., Hessian overian regiments were constantly in the e English government for temporary pur- Hessians fought for us in the first American d the Landgrave of Hesse, who sold his so much a head, received upwards of half for soldiers lost in the campaign. During rebellion, again, in 1798, many Hessian ere employed.

e outbreak of the continental war in 1793, etermined to recruit the British army by tion of a large body of foreigners; and gly, in 1794, an act passed for the embodi- the 'King's German Legion,' consisting of en. These troops, who were increased in e of the war to nearly double that number, shed themselves in various engagements, ed some of the regiments on which our could best rely. Corps of French *émigrés*, rk Rangers and others, were also organised. le of the foreign legions were disbanded in officers being placed on half-pay.

g the Russian war, in 1854, the British ent again had recourse to the enlistment of s; special provision being made in the orising their employment, that the arms egionaries were in no case to be used British subjects, in the event of internal The numbers to be raised were 10,000 . 5000 Swiss, and 5000 Italians; the pay to ame as to British troops, but temporary convey no claim to half-pay. About half ber of men were enrolled, and were said to hed great efficiency, when the stoppage of s arrested their progress, and caused them anded at a great cost for gratuities, &c.

An attempt was made to locate the Germans as military settlers on the frontier of Cape Colony where they should at once be a protection against the Kafirs, and a valuable addition to the labour in the eastern provinces; but partly from the paucity of females in their community, and partly from the temptation to abscond, offered by the high wages in other parts of the colony, Stutterheim, as the settlement was called, has had indifferent success. Many of the soldiers of the Italian legion subsequently turned their training to good account under Garibaldi.

Troupes étrangères form a permanent portion of the French army, where they are held in good esteem; they are usually Swiss, who are always willing to sell their services to any power, whatever the cause, provided only that the pay is good. The throne of the late Neapolitan monarchy was latterly upheld chiefly by Swiss mercenaries.

FOREIGN BILL OF EXCHANGE is a bill which is either both drawn and accepted abroad; or drawn by a person residing abroad on a person in this country, or the reverse. If a bill be drawn abroad, and accepted in England, it does not require a stamp; but if drawn in this country upon a correspondent abroad, or a foreign house, it must be stamped (19 and 20 Vict. c. 97, ss. 6 and 7); and when drawn abroad, it must be stamped by the holder, before he can present it for payment, or indorse, transfer, or otherwise negotiate it within the United Kingdom (Chitty on *Bills of Exchange*, 72). It has, however, been decided that the stat. 17 and 18 Vict. c. 83, s. 3, does not render a stamp necessary where a bill drawn abroad has been indorsed abroad to a person in England, and presented by him for acceptance in England (Phillimore, *International Law*, iv. 609). Formerly, a bill drawn or payable in Scotland or Ireland, was foreign in England; but such bills were made inland by the statute just mentioned; and the same regulation was extended to the islands of Man, Guernsey, Jersey, Alderney, and Sark (s. 7). See BILL. It has been established as a rule in England, that the liabilities of the drawer, the accepter, and indorser, shall be governed by the laws of the countries in which the drawing, acceptance, and indorsement respectively took place (Phillimore's *International Law*, iv. p. 606 and 506). In the case of bills which are both drawn and accepted abroad, and which are thus in reality foreign contracts, but of which the accepter is a native of this country, and which are sought to be enforced in the courts either of England or Scotland, a distinction is made between the contract and the remedy: 'Whatever relates to the nature of the obligation—*ad valorem contractus*—is to be governed by the law of the country where it is made—the *lex loci*; whatever relates to the remedy, by suits to compel performance, or by action for a breach—*ad decisionem litis*—is governed by the *lex fori*—the law of the country to whose courts the application is made for performance or for damages.' —Lord Brougham in *Don v. Lippman*, House of Lords, 26th May 1837; Shaw and Maclean, ii. p. 723.

FOREIGN COURTS. Kent, after stating that in cases not governed by the constitution and laws of the United States, the doctrine of the English law, as to the force and effect to be given to foreign judgments, is the law of his own country also, observes, that the law thus common to England and America 'is exceedingly, if not peculiarly liberal, in the respect which it pays to foreign judgments, in all other cases except the case of a foreign divorce or an English marriage. A distinction was early taken by Lord Nottingham, and is now recognised

both in England and America, and indeed almost everywhere else, between a suit brought to enforce a foreign judgment, and a plea of a foreign judgment in bar of a fresh suit for the same cause. As the effect to be given to a foreign judgment is altogether a matter of comity, in cases where it has not been regulated by positive treaty, and no sovereign is bound to execute within his own dominions a sentence given out of it, the rule adopted, where a suit is brought to enforce a foreign judgment, is that the foreign judgment is to be received, in the first instance, as *primâ facie* evidence of the debt, but that the defendant is entitled to impeach the justice of it, or to shew that it was irregularly and unduly obtained. But the case is different where the losing party comes forward and wishes to institute a new suit upon the same matter, and to open up a foreign judgment dismissing the action, pronounced by a competent court. In this case, to interfere with the foreign judgment would be to assume the attitude of a court of review, and the rule in England, consequently, is that such a decision, when given by a foreign court, is final and conclusive. So obvious, indeed, is the convenience and necessity of this rule, that it has been regarded as forming a portion of general jurisprudence.'—Kent's *Com.* ii. 101, 102. As regards the enforcement of foreign decrees and judgments, the usages of nations have differed considerably, and the subject is far too wide and too difficult to admit of being satisfactorily discussed in this work. The distinction between the recognition of the judgment of a foreign court, as determining the validity of a foreign contract, and the application of a foreign remedy by the courts of this country, has been pointed out under Foreign Bill of Exchange (q. v.). For practical purposes, however, it may be convenient that we should state that, contrary to the popular belief in England, the French courts are in the habit of giving effect to judgments obtained in England, and that debtors cannot escape from their creditors, as is too generally supposed, by simply crossing the Channel. The difficulty, no doubt, still exists where the debtor has escaped before any proceedings could be taken against him in this country, and where no judgment can be obtained. But if he has once been served with process in England, or cited either edictally or otherwise in Scotland, the creditor may go on with his action against him though he be personally absent from the country, and ultimately enforce his decree against him by the interposition of a French court. The same observations apply to Belgium. In England, there is no regular office, as in Scotland, for the publication of citations to persons abroad (see EDICTAL CITATION), but leave to substitute service at the last place of abode, in place of personal service, may now be obtained in some cases from the courts, or leave may be granted to serve out of the jurisdiction. In most countries, the rule as to two foreigners resident but not domiciled is, that they may sue each other in the ordinary courts, as natives do. To this the French courts are an exception, and hold themselves incompetent to entertain suits between undomiciled foreigners relating to personality, except in matters of commerce (Phillimore, *International Law*, iv. 645). See JURISDICTION; DOMICILE; INTERNATIONAL LAW, PRIVATE; CONFLICT OF LAWS, &c.

FOREIGN ENLISTMENT ACT. In the law of England, there is a statutory prohibition of enlistment in the service of a foreign prince in 3 Jac. I. c. 4, s. 18; but the statute commonly known as the Foreign Enlistment Act is 59 Geo. III. c. 69. It provides that if any natural-born Englishman shall enter into the service of any foreign state, either as a soldier or a sailor, without the licence of his majesty, or an order in council or royal proclamation, or if any person within the British dominions hire or attempt to hire any person to enlist in the service of a foreign state, such person shall be guilty of a misdemeanour. The officers of the customs, on information on oath, may detain any vessel having persons on board destined for unlicensed foreign service. Masters of vessels, knowingly having such persons on board, are subjected in a penalty of £50 for each individual. Persons fitting out any vessel for foreign service, without licence, are guilty of a high misdemeanour, and the ship and stores are forfeited. Even to assist a foreign state with warlike stores, without licence, is a misdemeanour punishable with fine and imprisonment. These penalties are irrespective of any consequences that may follow to the individual for having committed a breach of international law.

FOREIGNER. See ALIEN.

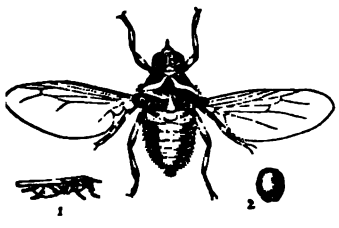
FO'RELAND, NORTH and SOUTH, two promontories on the east coast of Kent, between which are the Downs and Goodwin Sands. North F., the *Cantium* of Ptolemy, forms the north-east angle of the county and of Thanet Isle, in lat. 51° 22′ N., and long. 1° 26′ E., two miles east of Margate. It consists of chalky cliffs, nearly 200 feet high, projecting into the North Sea, and has a light-house with a fixed light, 184 feet high, and seen 24 miles off. South F., also composed of chalk-cliffs, is 16 miles south of North F., 3 miles north-east of Dover, in lat. 51° 8′ N., and 1 22′ E. It has two fixed lights, respectively 380 and 275 feet above the sea, and seen from a distance of 25 and 22 miles. From this point, there is often a magnificent view of 200 to 300 merchantmen passing by, after having been detained by contrary winds in the Downs.

FO'RELOCK is a flat wedge driven through the end of a bolt to prevent its withdrawal: it is used principally on board ship.

FORESHO'RTENING, a term in Painting or Drawing, applied to signify that a figure, or a portion of a figure, which is intended to be viewed by the spectator directly or nearly in front, is so represented as to convey the notion of its being projected forward; and, though by mere comparative measurement occupying a much smaller space on the surface, yet to give the same idea of length or size as if it had been projected laterally. In compositions of figures and groups on ceilings, and in the interior of domes, &c., numerous examples will be found in which this art has been put in practice; in the works of Raphael, foreshortening is practised with most judgment and correctness; those of M. Angelo, Correggio, and Tintoretto display the greatest boldness; but the three last-named artists have been censured for introducing foreshortening too frequently into their compositions, for the purpose of parading their skill in practising it.

FOREST FLY (*Hippobosca equina*), an insect of the order *Diptera*. It receives the name F. F. from its frequent occurrence in forests, and particularly in the New Forest, Hampshire. It is also sometimes called HORSE FLY, from the annoyance which it gives to horses. It is a small insect, about four lines long; its wings, two in number, much exceeding the length of the abdomen. When at rest, the wings are laid flat on the back, one overlapping the other. The general colour is brown, the thorax varied with pale yellow, the legs ringed with yellow and brown. The legs terminate in hooked claws. The skin is leathery and remarkably tough, so that the insect cannot be killed by any ordinary amount of squeezing. The structure of the mouth differs much from that of ordinary dipterous insects, and

inconsiderable resemblance to that of fleas. ': lives by sucking the blood of quadrupeds, as of oxen, dogs, &c., but most of all of



rest Fly (*Hippobosca equina*), magnified: ral size; 2, the pupa, as deposited by the mother.

High-bred horses with smooth hair are ble to this annoyance. The female F. F. deposit her eggs until they have reached stage in her abdomen. One only is pro- ; a time, enclosed in a tough, strong skin, black, and shining like a bead, wonderfully en the size of the abdomen from which it onsidered; the perfect insect finally emerges ing open a kind of lid or cap.

ST LAWS, in England, laws for the regu- the royal forests. Forest is defined by ke to be a safe preserve for wild animals the chase, whence comes the term *foresta*, change of *e* into *o* (*Co. Litt.* 233 a). Both robably spring from the same root as the *ris* and the French *hors*, and signify that *without* the range of the peopled or culti- ountry. Hence the Italian *forestiere* and and the Spanish *forestero*, signify strange, wild, and the like. A forest, in the the law of England, is a large tract of ound, not necessarily covered with wood, ally containing woodland interspersed with and forming part of the property of the , and governed by a special code, called st law. This particular law had reference to matters connected with hunting and but generally governed the persons living e forest in all their relations. A chase is r forest, in the hand of a subject, but not l by forest law. Though the privilege of elongs of right to the sovereign alone, it granted by him in favour of a subject, who entitled to exercise the privileges of forest istrict assigned. This right was exercised Saxon kings, who reserved large tracts of for the royal pastime of hunting, and a of the forest was said to have been passed te at Winchester in the year 1016. But nenticity of this document is doubted by ke (*Inst.* iv. 320). William the Conqueror extended the royal forests, by laying desert tricts in Hampshire and Yorkshire; he oduced penalties of the severest kind for against the game. The penalty for killing r boar was loss of eyes; for William loved t game as if he had been their father (*Stow*). It was not till the reign of Henry III. laws of the forest were reduced into a regular n the reign of that monarch was passed the of the forest, 9 Henry III. (A. D. 1224). The the sovereign to create a forest is by the law confined to lands of his own demesne. II. had arbitrarily exercised his power by ng the lands of his subjects; but by the 1st chapters of the charter of the forest, it is l that all forests so made should be dis- d. At a subsequent time, when Henry VIII. created Hampton Court Forest, he was obliged to obtain the consent of the freeholders before he could erect a chase or forest over their grounds (Coke, *Inst.* iv. 301). Mr Hallam remarks: 'It is well known that Charles I. made Richmond Park by means of depriving many proprietors not only of their common rights, but of their freehold lands. It is not clear that they were ever compensated, but I think this probable, as the matter excited no great clamour in the Long Parliament.'—Hallam, *Const. Hist.* i. 463, note, 1st ed. By the charter of the forest, the penalties for destroying game are greatly modified. By cap. 10, it is provided that no man shall lose life or limb for slaying deer, but that the punishment shall be restricted to fine or imprisonment for year and day. Cap. 11 contains the following curious privilege: 'Whatsoever archbishop, bishop, earl, or baron, coming to us at our commandment, passing by our forest, it shall be lawful for him to take and kill one or two of our deer by view of our forester if he be present; or else he shall cause one to blow an horn for him, that he seem not to steal our deer; and likewise they shall do returning from us.' This law is still unrepealed; so that a bishop may kill the Queen's deer when summoned to, or returning from parliament. Charles I. attempted to fill his empty exchequer by imposing penalties and exacting fines for alleged encroachments on the ancient boundaries of the forests, though the right to the lands thus taken was fortified by possession for several centuries. This was one of the first grievances with which the Long Parliament dealt, and since the passing of the act for the 'certainty of forests' (16 Car. I. c. 16), the laws of the forest have practically ceased. In Coke's time, there were sixty-nine royal forests, all of which, with the exception of the New Forest and Hampton Court Forest, had been created before the period of record. Of these, the principal were—the New Forest, Sherwood, Dean, Windsor, Epping, Dartmoor, Wichwood, in Oxfordshire, Salcey, Whittlebury, and Rockingham, in Northamptonshire, Waltham, in Lincolnshire, and Richmond, in Yorkshire. During the present reign, several of the royal forests have been disafforested by act of parliament—Hainault, 14 and 15 Vict. c. 43; Whittlewood, 16 and 17 Vict. c. 42; Wichwood, 19 and 20 Vict. c. 32. Public necessity is the plea on which these spots, long so famous for their silvan scenery, have been condemned. The plea is one which cannot be altogether disregarded; but it is to be hoped that it will not be suffered to prevail to the entire destruction of our royal forests, some of which, from their vicinity to large towns, afford resorts for public recreation highly prized by the citizens, and which never can be equalled in beauty and in healthfulness by any new-made pleasure-ground.

The royal forests of Scotland, in ancient times, seem to have been nearly as numerous as those of England. In Perthshire, there were the forests of Athole, Mamlorn, Glenartney, Glenfynlas, Glenalmond, Birnam, Cluny, Alyth, &c. In Forfarshire, there were Platan, Montrethmont, Kilgerry; in Kincardineshire, Cowie and Durris; in Aberdeenshire, the Stocket, Dyce, Kintore, Benachie, Drum, Birse, Braemar; in Banffshire, the Boyne and the Enzie; in Morayshire, Darnaway, &c. South of the Forth, there were the forests of the Torwood, Cadzow, Ettrick, Selkirk, Jedburgh, Traquair, the New Forest in Dumfriesshire, &c. The *Leges Forestarum*—the Scottish Forest Laws—have been printed more than once; the best edition is in *The Acts of the Parliaments of Scotland*, vol. i. pp. 323—328 (Edin. 1844). The forest code of Scotland, though neither so complete nor administered with the same

rigour as that of England, was still generally complained of for its severe penalties or vexatious restraints. The grant of a right of forestry conferred the same privilege as if the ground over which it extended had been originally, and had continued to be, a king's forest. Hence arose great oppression and annoyance to neighbouring proprietors, and in 1680 the supreme civil court suggested that a representation should be made to the king against the granting of new forests. From a case which has just been decided, it would seem that the high pretensions of royal foresters have in some places survived to the present day. The Dukes of Athole still hold the extensive mountainous district called the forest of Athole, either in their own right or as foresters for the crown. In virtue of his rights of forestry, the present duke claimed the power of preventing his neighbour, the Laird of Lude, from killing deer on his own lands, and maintained that he was bound to allow the duke and his keepers to enter on his lands, and drive back any deer that might stray upon them from the forest of Athole. But the court decided (March 1, 1862) against the duke on both points.

Forest Courts were courts established for the purpose of enforcing the forest laws in the royal forests. Of these courts, there were in England four—viz., the Court of Attachments, the Court of Regard, the Court of Swainmote, and the Court of the Lord Justice in Eyre in the Forest, or Justice Seat. The last Court of Justice Seat that was held where business was transacted was in the reign of Charles I., before Lord Holland.

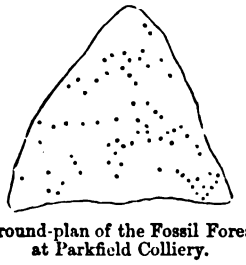
FOREST MARBLE, a member of the Lower Oolite, so called because of the occurrence of the typical beds in Wichwood Forest, Oxfordshire. The principal bed is a fissile limestone, containing large numbers of dark-coloured shells, and capable of sustaining a fine polish. On this account, it is used to some extent as 'marble.' It is interstratified with blue marls and shales, and fine oolitic sandstones. The whole thickness of the group seldom exceeds forty feet.

FOREST OAK, a name sometimes given in commerce to the timber of *Casuarina torulosa*, and other species of *Casuarina* (q. v.), Australian trees. This timber, which is light yellowish brown, and prettily marked with short red veins, is imported into Britain, and used for ornamental work.

FORESTA'LLING. See ENGROSSING.

FORESTS. See ARBORICULTURE.

FORESTS, FOSSIL, have been frequently observed in the coal measures. The seams of coal having in general been formed from the vegetation of the locality where they occur, it is to be expected that when the coal is removed, the stools and roots of the trees would be observed in the immediately subjacent bed of shale—the ancient soil. Such a forest was laid bare in an open work at Parkfield Colliery, near Wolverhampton, in 1844. In the space of about one-fourth of an acre, the stumps of 73 trees, with their roots attached, appeared as shewn in the annexed ground-plan. The trunks, broken off close to the root, were lying prostrate in every direction, often crossing each other. One of them measured 15, another 30 feet in length, but they were generally shorter. They were invariably converted into coal, and flattened to the thickness of 1 or 2 inches. The upright stems shew that some of them had a circumference of more than 8 feet. Similar fossil forests have been observed in the coal-fields of Nova Scotia, and have been carefully described by Lyell, Logan, and Dawson. The usual height of the trees observed by Lyell was from 6 to 8 feet; but one tree was about 25 feet high, and 4 feet in diameter. Brogniart describes the remains of a fossil forest preserved in an upright position, in strata of micaceous sandstone, belonging to the coal measures at St Etienne, near Lyon. Though most abundant in strata of the carboniferous period, fossil forests have been observed in other formations. The Dirt-bed (q. v.) of the Lower Purbeck series is the remains of an ancient forest. Instances are also abundant in the pliocene strata. Sometimes, as on the coast of Devonshire and on the shores of the Firth of Tay, they are exposed on the surface, stretching from high-water mark to far below the furthest limit of low water; or they are exhibited in section, as in the cliffs of Eastern Norfolk, where, resting on the chalk or crag, there is a stratum in which the stools and roots of the trees stand in their natural position, the trunks having been broken short off, and imbedded with their branches and leaves. This stratum is covered with fresh-water beds and drift. The position of these forests indicates a variation, in recent geological time, of the relative level of land and water. The instances in Devonshire and Fifeshire may imply a simple subsidence of the land; at Norwich, however, a considerable depression must have taken place, to admit of the deposition of the fresh-water beds and the till, and a subsequent elevation, to expose the beds so high above the sea-level.



Ground-plan of the Fossil Forest at Parkfield Colliery.

The remains of ancient forests, belonging to a yet later period, are to be found in beds of peat. There is good evidence that some kinds of peat had their origin in the destruction of forests. Trunks and branches of beech, hazel, fir, &c., are found in them, and their roots may be traced in the underclay. The rapidity with which this peat is formed is very remarkable. At Blair-Drummond, the stratum of peat is eight to ten, and in some places even twenty feet in thickness. Many of the trees here have been felled with the axe, and that this was done while the Romans were in possession of the country, is proved by the discovery of 'corduroy roads,' leading from one camp to another, and the finding of camp-kettles at the bottom of the peat.

FO'RFANG, or FOREFANG (Sax. *fore*, before, and *fangen*, to take), the taking of provisions from any one in fairs or markets, before the king's purveyors were served with necessaries for his majesty. (Charter of Henry I. to the hospital of St Bartholomew in London, anno 1133, referred to in Tomlin's *Dic.*) It is also used to signify the rescuing of stolen or strayed cattle from a thief, or from those having illegal possession of them; or the reward fixed for such rescue (Wharton's *Dic.*).

FO'RFAR, supposed to be the ancient *Orrea*, the county town of Angus or Forfarshire, situated near a small lake of the same name, on a rising-ground of no great height, in the fertile valley of Strathmore. Pop. (1861) 9258. It has been a royal burgh since the reign of King David I. (1124–1153). It had a royal castle, of which no vestige remains, said to have been situated on a round hill, on the north side of the town, and to have been destroyed by order of King Robert Bruce, in the year 1307. Its staple manufacture is linen

ected by railway with Aberdeen, Arbroath, outh. It joins with Montrose, Arbroath, and Bervie, in sending a representative to t.

ARSHIRE, or ANGUS, is a maritime the east of Scotland, being bounded on the German Ocean, on the N. by Kincar- Aberdeen shires, on the W. by Perthshire, e S. by the Firth of Tay. It extends from south 38 miles, and from east to west 27 th 45 miles of coast. There are several considerable extent, the principal of which Isla, Glen Prosen, Glen Esk, Clova, and which are all well watered, and mostly e. The surface of the county is irre- d it is intersected with hills, the Sidlaw 00 feet high, and Catlaw, the highest, . The soil, which is various, ranging from t alluvial to the moorish, rests mostly on red sandstone and the trap. RFEITURE AND CORRUPTION OF OD are penalties consequent on convictions for treason or felony. The penalty of forfeiture for treason is founded on this consideration, that he who hath thus violated the first principles of government, and broken his part in the original contract between king and people, hath abandoned his connection with society, and hath no longer any right to those advantages which before belonged to him purely as a member of the community (Stephen's *Com.* iv. 497). The penalty of forfeiture for treason prevailed in England before the Conquest, as is clear from the fact, that lands held in gavelkind, which is a Saxon tenure, may be forfeited for treason. But after the Conquest, forfeiture of lands and goods came to be regarded as the peculiar punishment of felony, of which treason against the sovereign was the highest kind, and was denominated high treason, to distinguish it from all other felonies, which were called petty treason. In cases of treason, the offender forfeits all his lands absolutely to the crown. In felony, according to the old law, the offender forfeited to the crown the profits of all estates of freehold during his life, and all his estates in fee-simple for a year and a day, after which they became escheat to the lord. The crown, during the year of occupancy, was entitled to commit upon the lands what Waste (q. v.) it pleased. By *Magna Charta*, this power of committing waste was restrained. But by 17 Ed. II. c. 16, the king's title to waste was again recognised. As the law now stands, murder is the only felony by which forfeiture for year and day is incurred. In all felonies, the goods and chattles of the offender are, on conviction, forfeited to the crown; but until conviction, forfeiture of the goods does not operate. Where, therefore, a person has disposed of his goods before conviction, the crown cannot reach them. Forfeiture of lands does not take effect until sentence of Attainder (q. v.) has been pronounced. So that a person committing *Fe'lo de se* (q. v.), or a rebel dying before sentence, or killed in open rebellion, does not forfeit his lands. But sentence of attainder, as soon as pronounced, has a retro-active effect, and annuls all conveyances made between the act of treason or felony and the pronouncing of sentence. Conveyances made before the act of treason are not affected. Hence, a wife's jointure is not forfeited, because settled on her before the commission of the act. But dower is forfeited by 5 and 6 Ed. VI. c. 11. Counterfeiting the coin was formerly treason; but by various statutes, it is provided that the wife's dower should not be forfeited, and that the lands should be forfeited only for the life of the offender. Forfeiture for treason and felony is accompanied by *corruption of blood*, whereby the offender is incapable of inheriting any lands or of transmitting any title to an heir. But where the lands were not vested in the offender at the time of the act, they are not forfeited to the crown, but to the overlord. In England, this distinction is of little moment, except in copyhold lands, the crown being, in fact, the overlord of nearly all the freehold land in the kingdom. By 7 Anne, c. 21, it was enacted that, after the death of the Pretender and his sons, no attainder for treason should operate to the prejudice of other than the offender himself; but this provision was repealed, 39 Geo. III., c. 93. But in Scotland, where subinfeudation still subsists, the distinction is of practical importance. In Scotland, before the Union, forfeiture of estate was incurred on account of treason and certain other crimes, as theft by a landed man, and uttering false coin. Lord Stair is of opinion that the doctrine of corruption of blood did not prevail in Scotland to exclude those claiming through a person attainted, where the offender was only apparent heir (Stair, iii. 3, 38). Since the Union, the law of Scotland in regard

to forfeiture for treason has been assimilated to that of England.

In America, forfeiture of estate for crimes is very much reduced, and the corruption of blood is universally abolished. Several of the state constitutions have provided that no attainder for treason or felony shall work corruption of blood or forfeiture of estate, except during the life of the offender, and some of them have taken away the power of forfeiture absolutely, without any such exemption. Every person convicted of any manner of treason, under the laws of New York, forfeits his goods and chattels, and also his lands and tenements, during his lifetime; but the rights of all third persons existing at the time of the commission of the treason, are preserved. Kent's *Commentaries*, ii. 505.

FORFEITURE OF LANDS was originally a penalty of the feudal law, incurred on account of some act by the tenant inferring disloyalty to his overlord. The acts inferring forfeiture might be of either a civil or a criminal nature. Forfeiture for crimes was incurred by treason or felony. See FORFEITURE AND CORRUPTION OF BLOOD. Civil forfeiture may be incurred in England in three ways—viz., by tortious alienation, by wrongful disclaimer, and by alienation in mortmain; the first two of these modes were incidents of the feudal tenure, the latter was introduced by statute. It must be observed that, according to the earliest feudal customs, a gift of lands was always made in favour of a particular person, and that alienation, without consent of the overlord, involved a forfeiture of the fee. But this strictness having by degrees ceased to be observed, forfeiture was only incurred in case of a tortious alienation. Tortious alienation was where the owner of a particular estate conveyed by common law conveyance, as feoffment, fine, or recovery, a greater estate than that to which he was himself entitled, as where a tenant-for-life made a feoffment in fee. The immediate effect of this act was the forfeiture of the land to the remainder man or reversioner. By 3 and 4 Will. IV. c. 74, abolishing fines and recoveries, and 8 and 9 Vict. c. 106, s. 4, declaring that a feoffment should not have a tortious operation, forfeiture by tortious alienation has ceased to have a practical importance. Forfeiture by wrongful disclaimer was where a tenant holding under a superior lord, on being summoned in any court of record, either disclaims his allegiance, or does any act which amounts to a disclaimer. Since the abolition, by the statute of *quia emptores*, of subinfeudation, this species of forfeiture can only arise in lands held of the crown. Forfeiture by alienation in mortmain is incurred by the conveyance of lands or tenements in favour of any Corporation (q. v.), sole or aggregate, ecclesiastical or temporal. As by vesting the land in a tenant of this description, the overlord was deprived of all the duties and services due by his vassal, this act was declared by various acts of parliament to infer the forfeiture of the lands. See MORTMAIN. Forfeiture of copyholds was incurred by committing waste, and by other acts of a wrongful kind inconsistent with the fealty due to the lord. See Blackstone, *Com.* ii. 284. Forfeiture on breach of condition, subsequent is where an estate is held upon a condition contained in the grant itself. On failure of the condition, the grantor or his heirs may enter upon the lands.

In Scotland, civil forfeiture may arise either from statutory enactment, at common law, or by agreement. By 1597 c. 246, it is enacted that vassals failing to pay their feu-duties for two years shall forfeit their right. This forfeiture must be established by an action to recover the feu-duties in arrear, and may be avoided by payment at the bar. At common law, a vassal forfeited his land by disclamation or purpresture. The former is analogous to the English disclaimer, and consists in the denial by a vassal of his lawful superior. Purpresture was incurred by the vassal's encroachment on the streets, highways, or commonties belonging to the crown or other superior. These forms of forfeiture are fallen into disuse. Forfeiture on special agreement depends wholly upon the terms of the condition inserted in the titles to the land. The condition must be fortified by irritant and resolutive clauses, and must enter the sasine, in order that it may be effectual against purchasers of the lands (Erskine, ii. 3, s. 13). Of this kind of forfeiture are breaches of Entails (q. v.).

FORGE, FORGING. The process of hammering red-hot iron or steel into any required shape is called Forging, and the workshop in which the operation is performed, a Forge. The principal tools of a common smith's forge are the forge-fire or hearth, with its bellows, the anvil, and the various hammers, swages, &c. For large work, an air-furnace, blown by steam-bellows, supplies the place of the simple hearth of the blacksmith, powerful cranes swing the work to its place on the anvil, and a steam-hammer (see HAMMER) strikes the blows that squeeze the red-hot mass into shape. Besides these, there are portable forges of various sizes and forms, used for military and other purposes. They usually consist of an iron frame, to which a bellows, worked by the foot, is attached; and above the bellows is an iron tray, with a hearth, &c., upon which the fire is made; and the anvil is either attached to this frame, or has a separate stand.

Under CUTLERY, the general method of forging small work is described. For the largest work to which hand-hammers are still applied, such as anchor-forging, two gangs of from six to twelve hammermen are employed; they swing the large hammers with such wonderful precision and regularity, that the instant one hammer is withdrawn, another falls upon the same place. A foreman, with a wand, directs the hammering. The two gangs relieve each other alternately, on account of the great severity of the labour. Shovels, spades, mattocks, and many other tools and implements, are partly forged under the tilt-hammer. See STEEL.

In all processes of forging, it is of primary importance to obtain the greatest possible rapidity in the succession of the blows. There is a double reason for this: first, and simply, that the work is cooling, and the more slowly it is forged, the more frequently it must be re-heated; and secondly, that percussion generates actual heat, and if the blows are sufficiently heavy and rapid, the temperature of the work may be fully maintained out of the fire for a considerable length of time. The hammer used for tilting steel not only maintains the heat of the bar, but raises it from a dull to a bright red heat.

FORGERY (Fr. *forger*, to form metal into shape; to fabricate), the *crimen falsi* of the Roman law, is held in England, at common law, to be the fraudulent making or altering of a writing or seal, to the prejudice of another man's right, or of a stamp to the prejudice of the revenue. As regards writings, the instrument forged must be executed with such skill or in such circumstances as to be capable of being mistaken for a genuine document by a person of ordinary intelligence and observation. It is not necessary that there should be even an attempt at imitation. If there was intention to deceive, and the circumstances were such as to render deception possible, the crime has been committed, and it has consequently been held in Scotland that it is possible to forge the name

on who cannot write (1 Alison, p. 372), ver that the crime may be committed hibition of a cross or mark (Macmillan, 24, 1859). Any material a'teration, how-t, is a forgery just as much as the sub- of the name of the pretended maker, or cation of the entire deed. It will not e crime, though the whole deed should ne, the name only being forged, or the ng really the handwriting of the party to belongs, but appended to a forged deed. he name be a fictitious one, but appended urpose of deceiving, a forgery has been d just as much as if it belonged to a real Long before the recent extensions took he law of evidence, by which parties were as witnesses in their own causes, it was by 9 Geo. IV. c. 32, that the party whose l been forged might be a witness to the t the writing was not his. But, on the id, it is an established rule of law that of forgery, by a mere comparison of hand- is incompetent (Tailor on *Evidence*, p. , 2d ed.). Identification of handwriting is, e, more difficult than identification of the hich so often forms the chief difficulty in rials. 'As illness, strange dress, unusual and the like, cause mistakes in identifying idual, so a bad pen, or rough paper, a and, hurry, and many other things, change rance of a person's handwriting.'—Dickson nce, p. 474. There are besides resem- n handwritings proceeding from many l causes, so that much caution is neces- eighing this kind of evidence. 'It ought erefore, to be regarded as full proof by n in criminal trials, and even in civil roborative evidence should be required, e proof of handwriting is so clear as to *onus probandi*.' Though writing-masters, , bankers' clerks, and other persons in the examining handwritings are often adduced es in trials for forgery, their evidence is very little value, and generally so con- nat it can be produced with equal effect side. The best witness is one who has n the party write, through whose hands g has been continually passing, and whose s not the result of an inspection made cular occasion for a special purpose. The o. IV., and 1 Will. IV. c. 66, makes the f the great seal, the privy seal, or any uet, the sign-manual, the seals of Scotland, great seal and privy seal of Ireland— The same statute declares the offence of r uttering with intent to defraud, stamps, r bills, Bank of England notes, bills of promissory notes, deeds, receipts, orders yment of money, transfers of stock, wills, e felony. Capital punishment was first with regard to special cases of forgery by .., and 1 Will. IV. c. 66, and 2 and 3 Will. ; and then altogether done away with by V. and 1 Vict. c. 84. The offender is now penal servitude, the length of which is at tion of the court; but which cannot be for three years, or he may be imprisoned for than four, or less than two years, with t hard labour and solitude. As to the Bank of England notes, see 16 Vict. c. 2. taining property by false pretences, see

ET-ME-NOT, or SCORPION GRASS , a genus of annual or biennial her- plants, of the natural order *Boragineæ*, eft calyx and salver-shaped corolla; the flowers small, and generally blue. The genus is diffused over the temperate zone in all quarters of the world, and a number of species are common in Britain, chiefly growing in ditches and damp meadows—as *Myosotis palustris*, with crooked creeping perennial roots—an angular stem of a foot in height, and calyx covered with appressed bristles. *M. sylvatica*, with calyx covered with stiff spreading hairs, grows in bushy places and woods, and is often planted in flower-gardens. The dark blue F. of the Azores (*M. Azorica*) has of late begun to be cultivated in Europe, but requires the green-house. The genus is a favourite one with most persons, both because of the brilliancy of the flowers, and because throughout Europe it is generally regarded as the emblem of friendship. The English name Scorpion Grass is now seldom heard. The German name *Vergissmeinnicht* corresponds with the English *Forget-me-not*.—*M. versicolor*, very common in Britain, often as a weed in gardens, is remarkable for the change of colour in the flowers, which are first yellow, then blue. They are very small.—*M. alpestris*, found on some of the mountains of Scotland, is especially admired for the size and brilliancy of its flowers.

FORIO, a thriving town of Italy, is picturesquely situated on the west coast of the island of Ischia, which stands at the northern side of the mouth of the Bay of Naples. The central portion of the town consists of very narrow streets, but the suburbs are composed of charming white cottages. It has three highly decorated churches, a good harbour, and some trade with Leghorn, Naples, and Genoa. Pop. 6500.

FORISFAMILIA'TION (literally, the putting forth from or beyond the family) is the separation of a child from the family of his father. A child is said to be forisfamiliated, either when he marries or when he receives from his father a separate stock, the profits of which are enjoyed by himself, though he may still reside with his father, or when he goes to live in another family with the consent of his father. The same result is also brought about when a child renounces his *legitim*, i.e., his legal share of the father's free movable property due to him on the death of the latter. See Bell's *Dic. of the Law of Scotland*.

FORKS. These table instruments are only about three centuries old. The Greeks, Romans, and other ancient nations knew nothing of forks. They had large forks for hay, and also iron forks for taking meat out of pots, but no instruments of the nature of table-forks. In ancient times, as is the practice still in the East, meat was commonly prepared as stews; or if roasted, it was cut into small pieces by a carver, so as to be easily taken in mouthfuls by the guests, who used their fingers and a knife for the purpose. It certainly is a strange fact, that the use of any species of forks at table was quite unknown till the 15th c., and they were then known only in Italy, which has the merit of this invention. None of the sovereigns of England had forks till after the reign of Henry VIII.; all, high and low, used their fingers. It was accordingly a part of the etiquette of the table to employ the fingers so delicately as not to dirty the hand to any serious degree; but as even by the best management the fingers were less or more soiled, it was the custom to wash the hands immediately on the dishes being removed from the table. Hence, in the royal household, there was a dignitary called the *Ewrar* or *Ewary*, who with a set of subordinates attended at meals with basins, water, and towels. The office of Ewary survived after forks came partially into use. We learn that when James I. entertained the

Spanish ambassador at dinner, very shortly after his accession, 'their majesties washed their hands with water from the same ewer, the towels being presented to the king by the lord treasurer, and to the queen by the lord high admiral.' The Prince of Wales had a ewer to himself, which was after him used by the ambassador.—Ellis's *Letters*. The first royal personage in England who is known to have had a fork was Queen Elizabeth; but although several were presented to her, it remains doubtful whether she used them on ordinary occasions. From the inventory of her majesty's appointments in Nichols's *Progresses*, it would appear that these forks were more for ornament than use. '*Item*, a knife and a spoune, and a forke of christall, garnished with golde sleightly, and sparcks of garnetts: given by the Countess of Lyncolne. *Item*, a forke of corall, slightly garnished with golde: given by Mrs Frances Drury. *Item*, one spoune and forke of golde; the forke garnished with two lyttle rubyes, two lyttle perles pendant, and a lyttle corall: given by the Countess of Warwicke.' These ornamental forks had doubtless been presented to the queen as foreign curiosities of some value, and were probably never used at table. As yet, and for a considerable time afterwards, forks were not in common use, a circumstance less attributable to ignorance of the invention, than to prejudice. So far was this prejudice carried, by even educated persons, that one divine preached against the use of forks, as being an insult to Providence not to touch one's meat with one's fingers!

Italy, as has been said, claims the merit of this useful invention. This fact is explicitly learned from an account of a tour in Italy by a traveller named Thomas Coryate, who visited that country in 1608. His travels, styled *Crudities*, were published first in 1611, and republished in 1776. In these *Crudities* appear the following passages respecting the Italian towns: 'I observed a custom in all those Italian cities and townes through which I passed, that is not used in any other country that I saw in my travels; neither do I think that any other nation of Christendom doth use it, but only Italy. The Italian and also most strangers do always at their meals use a little forke when they cut their meat. For while with their knife, which they hold in one hand, they cut the meate out of the dish, they fasten the forke, which they hold in their other hand, upon the same dish; so that whatsoever he be that sitting in the company of others at meals, should unadvisedly touch the dish of meat with his fingers, from which all the table doe cut, he will give occasion of offence unto the company, as having transgressed the laws of good manners, in so much that for his error he shall be at the least browbeaten, if not reprehended in wordes. This form of feeding, I understand, is generally used in all places of Italy; their forks being for the most part made of yron, steele, and some of silver, but these are used only by gentlemen. The reason for this curiosity is, because the Italian cannot by any means indure to have his dish touched with fingers, seeing that all men's fingers are not alike cleane. Hereupon, I myself thought good to imitate the Italian fashion by this forked cutting of meate, not only while I was in Italy, but also in Germany, and oftentimes in England since I came home; being once quipped for that frequent using of my forke, by a certain learned gentleman, a familiar friend of mine, Mr Laurence Whitaker, who in his merry humour, doubted not to call me at table *furcifer*, only for using a forke at feeding, but for no other cause.' The term here employed jocularly, was in its serious meaning one of reproach, having been applied by the Romans to those slaves who as a punishment bore a forked frame (*furca*), resembling an inverted A—hence the *forca* and *forchetta;* the latter (little fo followed in the French term *fourchette*, former is the root of the English word fork

Forks came so slowly into use in Engl they were employed only by the higher the middle of the 17th century. About t of the revolution, few noblemen had m a dozen forks of silver, along with a fe or steel. At length, for general use, s became an article of manufacture at She first, they had but two prongs, and it wa later times that the three-pronged kind we As late as the early part of the 18th c., ta and we may add knives, were kept on so scale by country inns in Scotland (and, per in some parts of England), that it was c for gentlemen in travelling to carry with portable knife and fork in a shagreen c till this day a small knife and fork form p ornamental equipment in the Highland dr general introduction of silver forks int Britain is quite recent; it can be dated n back than the opening of the continent t tourists at the termination of the Frenc 1814. The extensive use of these costl ments in the present day, marks in an extra degree the rapid progress of wealth and taste throughout the United Kingdom.

FORLI, an interesting city of Italy, c the province of the same name, is beautif ated at the foot of the Apennines, in a and fertile plain, on the right bank of the 16 miles south-west of Ravenna. It is a w handsome city, is surrounded with walls, tains many striking specimens of archite which the Guerini Palazzo, built after the d Michael Angelo, the Palazzo Comunale, th di Pietà, the cathedral, a majestic building churches of S. Philipo Neri, of S. Girolamo, Mercuriale, are the most notable. The ecc buildings of F. contain some of the best pi Cignani, Carlo Maratti, Guido, and other The citadel, founded in 1361, is now used as Pop. 18,043, who carry on silk-spinning refining, with a considerable trade in cor hemp, carthamus, woad, &c. F. (the ancien *Livii*) is said to have been founded by Livius Salinator, after his victory over H on the Metaurus, 207 B.C., and to have its name from him. In the middle ages, it republic, and exchanged its rulers frequentl the struggles of the Guelphs and Ghibelli 1503, it was annexed to the States of the and so remained till 1860, when it was pla the Æmilian provinces under the sceptre Emmanuel.

FORLO'RN-HOPE, the body of men se attempt a breach, or to lead in scaling the fortress. The name (which in the French *perdus*, is even more expressive) is given on of the extreme danger to which the lead storming-party are necessarily exposed. ever, the honour of success is proportionat peril of the undertaking, there is ordinarily of volunteers for this arduous service. The hope is called by the Germans *Die verlorne*

FORMA PAU'PERIS, the phrase usu ployed both in England and Scotland to si arrangements by which an action may b on by one who is too poor to sue in the way. In England, the statutes 11 Henry V and 23 Henry VIII. c. 15, provide that will swear themselves not worth £5, exc

ppareI and the matter in question in the all be exempt when plaintiffs, but not fendants, from the payment of court-fees, be entitled to have counsel and attorney to them by the court without fee. They er excused from costs when unsuccessful; e which, according to Blackstone, amounted r times only to the rather uncomfortable ve of choosing between paying and being

In the event of success, however, a ing in this form is entitled to his costs, his counsel and agent, and the officers of ough they are bound to give their labour him, are not bound to give it on the same his antagonist, unless he too be a pauper. nt the abuse of suing in the superior courts ninster in this form in matters of small it is provided (19 and 20 Vict. c. 108. s. 30), o certain exceptions, that any plaintiff who one of these, in a case falling within the e of a county court, and recovers no more , or in some cases £5, shall have no costs, satisfies the court or a judge that he had reason for taking that course. There are ier exceptions to the rule (see Stephen's p. 646).

rtland, this benevolent arrangement was d by statute more than half a century e date of the English act we have men- In 1424, the statute (c. 45), which we have noted under Advocate (q. v.), was passed urpose of securing professional assistance, the poor, and for giving to them and those ted them their costs in the event of success. special arrangements applicable to litiga- is form in Scotland will be detailed under ll (q. v.).

MATION, in Geology, is applied to a group united by some character which they have on, whether of age, origin, or composition, d or chalk formation.

MEDON, an old form of action, in the England, whereby an heir of entail or r man who had been ousted by a discon- was entitled to vindicate his claim to the n which he had been ousted. By 21 James I. was enacted that writ of formedon should ht within twenty years of the time when of action arose. Writ of formedon is now , together with other real actions.

MIC ACID (C_2HO_3,HO) derives its name circumstance of its having been first from the *Formica rufa*, or red ant. In a ted state, it is a fuming liquor with an odour, and occasions vesication if dropped skin. It crystallises at a temperature °, and boils at about 212°, yielding a vapour rns with a blue flame. It is a strong agent, at a boiling temperature reducing the ilver, mercury, platinum, and gold.

be obtained in various ways, as, for example: e distillation of red ants with water (a g never adopted now). 2. By the distilla- mixture of starch, binoxide of manganese, acid, and water; this is the usual method, ous organic matters, as sugar, chaff, bran, , &c., may be substituted for the starch. e distillation of oxalic acid mixed with far better (according to Berthelot), with . 1 equivalent of oxalic acid ($C_4O_6,2HO$) equivalent of formic acid (C_2HO_3,HO) + 2 ts of carbonic acid ($2CO_2$).

lot has recently obtained it synthetically by arbonic oxide gas for a prolonged period t with hydrate of potash, at a temperature of 212°. The gas becomes gradually absorbed, and formate of potash is the result, the reaction being exhibited by the formula, 1 equivalent of hydrate of potash (KO,HO) + 2 equivalents of carbonic oxide ($2CO$) = 1 equivalent of formate of potash (KO,C_2HO_3).

Formic acid is a very common product of the oxidation of organic bodies; thus, for example, the albuminates, glycine, sugar, starch, &c., yield it in association with other products, when acted on by chromic acid; the fats and fatty acids yield it when acted on by nitric acid; and it is a product of the action of ozone on glycerine, fats, fatty salts, acetic acid, and sugar, provided a free alkali is present. Hence, we can readily explain its occurrence as a product of oxidation in the animal organism, in which it not unfrequently occurs, either free or in combination. Thus we find it not only in ants, but in the poison of the bee and wasp, and in the hairs of the procession caterpillar. It has been detected by various chemists in the sweat, in the expressed juice of the spleen, pancreas, thymus gland, and muscles, in the brain, the blood, and the urine.

The salts of formic acid, which are termed by some chemists formates, and by others formiates, require no special notice. They are all soluble, and yield a red colour with persalts of iron.

FORMI'CA. See ANT.

FORMING'S ISLAND is a speck on the bosom of the Pacific, lying a little to the north of the Sandwich Group, or Hawaiian Archipelago, in lat. 30° 49′ N., and long. 159° 20′ W. It is one of the most recent additions to the British empire, having been formally occupied, mainly on account of its excellent harbour, towards the close of 1860.

FORMO'SA (Chinese name, *Tai-wan*), a large island on the south-east coast of China, opposite the province of Fu-keen, from which it is distant about 90 miles. It lies between 21° 53′—25° 16′ N. lat., and 120° 15′—122° 4′ E. long.; and for administrative purposes, is included in the province before mentioned, of which (together with Pang-hoo group) it forms a department. The length of F., from north to south, is about 237 miles, and its average breadth, from east to west, is about 70 miles. A chain of mountains running north and south nearly bisects the island, and divides it into an eastern and western province. Chinese settlers occupy the latter, but the other section is held by the aborigines. Tai-wan (q. v.), the capital, in 23° N. lat., and on the western coast, was opened to foreign commerce by the treaty of Tien-tsin, June 26, 1858. F. has a fertile soil, and produces rice, maize, sugar, tobacco, cinnamon, pepper, &c.; oranges, pine-apples, guavas, cocoa-nuts, pomegranates, as well as grapes, peaches, and other European fruits, are abundant. The aboriginal inhabitants are still in a very rude state.

FORMS OF ADDRESS. Many persons are exposed to inconvenience from their ignorance of the formal modes of addressing letters to persons of title; we shall therefore, in the present article, give an enumeration, taken mainly from Mr Dod's *Peerage and Baronage*, of the usual ceremonious modes of written address. Previous to their employment, the writer must, of course, learn either from the peerage-writers, or from some other source, the precise rank of the person whom he wishes to address, as well as the hereditary, personal, or official distinctions by which that rank is often modified.

1. *Archbishop*.—Letters are addressed: 'His Grace, the Lord Archbishop of ——,' and commence: 'My Lord Archbishop.' More formal documents are addressed 'The Most Reverend Father in God (John Bird), by Divine Providence, Lord Archbishop

of Canterbury;' other archbishops and suffragan bishops being 'by Divine permission.' When personally referred to, an archbishop is styled 'Your Grace,' not 'Your Lordship.' The Archbishop of Armagh is addressed as 'His Grace the Lord Primate of Ireland.'

Archbishops' wives, and the other members of their families, enjoy no titles, as such.

2. *Baron*—Addressed: 'The Right Honourable Lord ——;' referred to as 'His Lordship,' or 'Your Lordship.'

Baron's Daughter—'The Honourable Mary ——;' or, if married, 'The Honourable Mrs ——.' Letters commence, 'Madam.'

Baron's Son—'The Honourable John ——.' Letters commence, 'Sir.'

Baron's Son's Wife—'The Honourable Mrs ——.' Letters commence, 'Madam.'

Baron's Wife, and *Baroness* in her own right—'The Right Honourable Lady ——;' in strictness, but more commonly, 'The Lady ——.' Letters commence, 'Madam,' and refer to her as 'Your Ladyship.'

Baronet—'Sir John ——, Bart.' Letters commence, 'Sir.'

Baronet's Wife—'Lady ——.' Unless she has a title as the daughter of a peer, no Christian name is used. She is referred to as 'Your Ladyship.'

Bishop—'The Right Reverend the Lord Bishop of ——.' Letters commence, 'My Lord.' Frequently the address is simply, 'The Lord Bishop of ——.' The style in formal documents is, 'The Right Reverend Father in God (John ——), by Divine permission, Lord Bishop of ——.' Scotch bishops are addressed 'The Bishop of ——,' sometimes as 'The Right Reverend Bishop (e. g., C. H. Terrot)', and letters commence, 'Right Reverend Sir.' The colonial bishops are addressed by their territorial titles, like those of England.

Bishops' Wives and Children have no titles.

Countess—'The Right Honourable the Countess of ——.' Letters commence, 'Madam,' and refer to her as 'Your Ladyship.'

Duchess—'Her Grace the Duchess of ——.' Letters commence, 'Madam,' and refer to her as 'Your Grace.'

Duke—'His Grace the Duke of ——.' Letters commence, 'My Lord Duke;' and he is referred to as 'Your Grace.'

Duke's Daughter—'The Right Honourable Lady Mary ——,' or less formally, 'The Lady Mary ——.' Letters commence, 'Madam,' and refer to her as 'Your Ladyship.' If she is married to a person of inferior rank, her surname only is changed.

Duke's Eldest Son—Uses the second or some other title of his family by courtesy, and he is addressed as if he held the title by law, though in formal documents he is called '——, Esq., *commonly called* the Marquis or Earl' (as the case may be).

Duke's Younger Son—'The Right Honourable Lord John Russell,' or less formally, 'The Lord John R——.' 'My Lord,' and 'Your Lordship.'

Duke's Younger Son's Wife—'The Lady John ——,' unless where she has a title in her own right. 'Madam,' and 'Your Ladyship.'

Earl—'The Right Honourable the Earl of ——,' or less formally, 'The Earl of ——.' 'My Lord,' and 'Your Lordship.'

Earl's Daughter—Like Duke's Daughter (q. v.).

Earl's Eldest Son is addressed as if the title which he holds in courtesy were a title in law.

Earl's Younger Son—Like Baron's Son (q. v.).

Earl's Younger Son's Wife—Like Baron's son's wife, unless of superior rank to her husband.

Earl's Wife. See *Countess*.

KING—'The King's Most Excellent Majesty.' 'Sire,' and 'Your Majesty;' or, in less formal notes, thus: 'Mr Pill presents his duty to your Majesty.'

Knight Bachelor—Like Baronet (q. v.), except that the word 'Bart.' is omitted.

Knight Bachelor's Wife—Like Baronet's Wife (q. v.).

Knight of the Garter—K.G. is added to the name or other title of the bearer.

Knight of St Patrick—K.P. used in the same manner.

Knight of the Thistle—K.T.

Knight of the Bath—if a Knight Grand Cross, K.G.C.B.; if a Knight Commander, K.C.B.

Knight of the Bath's Wife—Like the wife of a Baronet or Knight Bachelor.

Lord Advocate (of Scotland)—'The Right Honourable the Lord Advocate' by courtesy; but in official documents he is styled 'Her Majesty's Advocate for Scotland.' Letters ought strictly to commence, 'Sir,' not 'My Lord,' though the latter mode of address is the more usual.

Lord Lieutenant (of Ireland)—'His Excellency the Lord Lieutenant;' and letters commence in accordance with his rank in the peerage or otherwise. If a duke, he is styled 'His Grace the Lord Lieutenant.'

Lord Mayor—'The Right Honourable the Lord Mayor.' 'My Lord,' and 'Your Lordship.' There are only three Lord Mayors—those of London, York, and Dublin.

Lord Provost—The Provost of Edinburgh is 'The Right Honourable the Lord Provost;' of Glasgow, 'The Honourable the Lord Provost;' of Perth, 'The Lord Provost.' There are no other Lord Provosts. Perhaps the distinction in the title of the chief magistrate of the Scottish capital is traceable to his having been always a member of the Privy Council of Scotland, from at least the period of the Revolution.

Lord of Session (in Scotland)—'The Honourable Lord ——.' 'My Lord,' and 'Your Lordship.'

Lords of Her Majesty's Treasury—These in their collective capacity are addressed as 'The Honourable the Lords Commissioners of Her Majesty's Treasury;' individually they have no title from their connection with the Treasury.

Maid of Honour—'The Honourable Miss;' and 'Madam.'

Marchioness—'The Most Honourable the Marchioness of ——.' 'Madam,' and 'Your Ladyship.'

Marquis—'The Most Honourable the Marquis of ——,' *not* 'The Most Noble.' Letters commence 'My Lord Marquis;' but when personally addressed, he is styled 'My Lord,' and 'Your Lordship.'

Marquis's Daughter—Like Duke's Daughter (q. v.).

Marquis's Eldest Son—Like Duke's Eldest Son (q. v.).

Marquis's Younger Son, like Duke's Younger Son (q. v.).

Mayors—In formal documents, 'The Right Worshipful the Mayor ——;' but in letters, simply 'The Mayor.'

Members of Parliament—The letters M.P. are added to their usual address.

Officers in the Navy and Army—Their rank in the service is always prefixed to any other title they may possess, thus: 'Captain the Lord John ——.'

Prince—'His Royal Highness Prince ——;' or 'His Royal Highness the Duke of ——,' when the Prince is also a Duke. In practice, the initials H.R.H. are usually substituted for the words. A letter begins 'Sir,' not 'My Lord Duke;' and the mode of reference is 'Your Royal Highness.'

Princess—'Her Royal Highness the Princess ——,' or 'The Duchess' (as the case may be). 'Madam,' and 'Your Royal Highness.'

's Wife, though of inferior rank, like a by birth.
Councillor—'The Right Honourable John

Councillor's Wife and Children have no

r—'The Queen's Most Excellent Majesty.'
,' and 'Your Majesty;' or, 'The Lord John resents his duty to your Majesty.'
unt—'The Right Honourable Lord Viscount less formally, 'The Lord Viscount.' 'My ıd 'Your Lordship.'
untess—'The Right Honourable the Vis-,' or less formally, 'The Viscountess.' ,' and 'Your Ladyship.'
unt's Daughter, like Baron's Daughter (q. v.).
unt's Son, like Baron's Son (q. v.).
unt's Son's Wife, like Baron's Son's Wife

ɔrmality of these modes of address experi-ɔnsiderable modifications when employed ɔns of equal rank. Between friends and , they are either entirely dispensed with of course, in addressing letters), or adapted elings and caprices of the writers. In this, ny other respects, we of the present gener- far less ceremonious than our fathers, and e than our grandfathers were. In most old t will be found that the titles of the writers erved even where there is the freest and uiliar interchange of thought and feeling. ıldress their husbands, and husbands their ıildren their parents, and occasionally even their children, as 'Sir' or 'Madam,' 'My 'Your Royal Highness,' as the case may be.

MS OF PROCEDURE. See PROCESS.

VICA'TION (*fornicatio*, from *fornix*, an lt, and by metonymy, a brothel, because at Rome were in cellars and vaults under

In most countries, this crime has been within the pale of positive law at some f their history, and prohibited by the impo- penalties more or less severe; but it has een found ultimately to be more expedient to the restraints which public opinion n it in every community which is guided by ciples of morality and religion. In England, during the ascendency of the Puritan party, ated act of keeping a brothel or committing on was made felony without benefit of a second conviction. At the Restoration, e crime of hypocrisy seemed for a time to be one which, under the influences of a very reaction, men were willing to recognise, this nt was not renewed; and though notorious n lewdness, when carried to the extent of public scandal, continued, as it had been an indictable offence at common law, the of fornication itself was abandoned 'to the ercion of the spiritual court, according ules of the canon law, a law which has he offence of incontinence with a great deal ness and lenity, owing perhaps to the con-celibacy of its first compilers.'—*Blackstone*. ceedings of the spiritual court were regu- 27 Geo. III. c. 44, which enacts that the t be instituted within eight months, and annot be maintained at all after the mar- the parties offending. But proceedings in siastical courts for this offence have now nto entire desuetude (Stephen's *Com.* iv. n Scotland, shortly after the Reformation, on was prohibited by what Baron Hume anxious statute of James VI' (1567 c. 13), 'Anent the Filthie Vice of Fornication, and Punishment of the samin.' This act, which was passed in the same parliament by which incest and adultery are punished with death, provides that the offender, whether male or female, shall pay for the first offence a fine of £40 Scots, and shall stand bareheaded, and fastened at the market-place, for the space of two hours; for the second, shall pay a fine of 100 merks, have the head shaven, and shall be exposed in the same public manner; and for the third, pay a fine of £100, be thrice ducked in the foulest pool of the parish, and be banished the town or parish for ever. There is but one instance of this statute having been enforced by the Court of Justiciary, which occurs, as might be supposed, during the government of the Protector in Scotland. The offence of keeping a house of notorious ill-fame and scandalising the neighbourhood, is punishable in Scotland as a police offence. See NUISANCE, MORAL, and PROSTITUTION.

FORRES, a royal burgh in the county of Elgin or Moray, situated on a well-marked old sea-terrace and promontory, distant about two miles from the mouth of the river Findhorn (q. v.). Pop. (1861) 3508. It was a royal burgh in the reign of King David I. (1124—1153), and was subsequently the seat of the Archdeacon of Moray, who had as his prebend the church of Forres, dedicated to St Laurence the martyr, and the church of Logynfythenach (now Edinkillie), dedicated to St John the Baptist. A painting of St Laurence holding in his hand the gridiron on which he is said to have been roasted, is preserved at Brodie House near Forres. The antiquities of the place are the remains of its castle, at the west end of the town, now surmounted by a monument, erected to the memory of Dr Thomson (a native of Cromarty, distinguished by his eminent medical services in the Crimean war), and the remarkable sculptured pillar—25 feet high—sometimes called Sueno's Stone, but more commonly 'the Stan'in' Stane,' which stands about a mile to the eastward. A monastery of black friars is said to have stood formerly on the site now occupied by Anderson's or the Forres Academical Institution. F. lies at the foot of a curiously formed group of four gravelly hills, named the Cluny or Cleeny Hills, evidently water-made, on the highest of which, the site of an old encampment, an octagonal tower 66 feet high, was erected to the memory of Nelson in 1806.

FORSTER, JOHN, an English political and historical writer, was born at Newcastle in 1812. He was educated for the bar, but early, like so many other law-students, devoted himself to periodical writing. In this sphere of literature he displayed more than usual ability; and his political articles in the London *Examiner*, for which he commenced writing in 1834, attracted more attention than is usually bestowed on newspaper leaders. There was a vigour and point about them, coupled with a truth, consistency, and outspoken honesty (the three latter qualities being more rare in newspaper writers a quarter of a century ago than they are now), which obtained a wide renown for the paper. F. became editor of the *Examiner* in 1846, an office which he still discharges. He is the author of many admirable biographical and historical essays, and we are indebted to him for much new and valuable information tending to elucidate obscure points, and correct erroneous notions about the times and statesmen of the English Commonwealth. It is to this period of history that F. has chiefly directed his studies, and no person desirous of properly understanding it, should neglect his *History of the Grand Remonstrance, Arrest of the Five Members*, and *Lives of the Statesmen of the*

Commonwealth His literary memoirs are also excellent, and his most elaborate effort in this way, *The Life and Times of Oliver Goldsmith*, is a charming piece of biography. F.'s style is clear, forcible, and elegant. He was appointed Secretary to the Commissioners in Lunacy in 1856; and in 1861, a Commissioner in Lunacy.

FORSTER, JOHANN REINHOLD, a German traveller and naturalist, was born in Dirschau, in Prussia, in 1729, and died at Halle in 1798. He was educated at Halle and Danzig for the clerical profession, and in 1753 became pastor at Nassenhuben, near Danzig; but he seems to have devoted most of his time to the study of mathematics, natural philosophy, natural history, and geography. In 1765, he accepted an offer made to him by the Russian government, to inspect and report upon the new colonies founded on the banks of the Volga; and the matter of his report is said to have been so good as to have given to the Empress Catharine suggestions for her great code of laws. His irritable temper soon involved him in difficulties with the Russian government; and in the following year he repaired to England, where the exertions of some of his scientific friends in London soon procured for him the office of teacher of natural history, and of the French and German languages, at an educational institution for dissenting clergymen at Warrington, in Lancashire. He retained this post until 1772, when he received, through the influence of Mr Banks, the offer of naturalist to Captain Cook's second expedition to the South Seas. In the course of the voyage, his temper seems to have frequently brought him into unpleasant collision with the other officers; and after the return of Captain Cook's vessels in July 1774, a controversy arose between F. and Lord Sandwich on the question as to who should write the narrative of the voyage. It was finally settled that F. should write the philosophical, and Cook the nautical parts of the work; but further difficulties arose, and Cook's journal appeared alone. In 1776, in association with his son, he published a work (in Latin) on the botany of the expedition; and in 1778 his *Observations faites dans un Voyage autour du Monde sur la Géographie Physique, l'Histoire Naturelle, et la Philosophie Morale* appeared. In the latter year, he returned to Germany, and was soon afterwards made Professor of Natural History and Mineralogy at Halle, where he remained until his death. In addition to the works mentioned, he published *De Byssо Antiquorum*, 1775; *Zoologia Indica*, 1781; *Geschichte der Entdeckungen und Schifffahrten im Norden*, 1784 (translated into English and French), &c.

FORSTER, JOHANN GEORG ADAM, commonly known as George F., eldest son of Johann Reinhold Forster (q. v.), a German traveller and naturalist, was born at Nassenhuben, near Danzig, in 1754, and died at Paris in 1794. When only 17 years of age, he accompanied his father in Captain Cook's second voyage; and shortly after his return, he published, with the assistance of his father, an account of the expedition. His book, which does not differ materially in its facts from Cook's narrative, was well received by the public, and was translated into French, German, Swedish, and other languages. Humboldt speaks of this work and of its author, 'my celebrated teacher and friend, George Forster,' in the highest terms in the *Cosmos* (see vol. ii. p. 437, Bohn's ed.). F. having returned to the continent, was made Professor of Natural History at Cassel, and afterwards at Wilna. Having there no access to books, in 1788 he gladly accepted the office of librarian to the Elector of Mayence. After Mayence was taken by the French in 1792, F., who had become an ardent republican, was sent as a deputy to Paris, to request the incorporation of Mayence with the French republic. While he was in Paris on this mission, the Prussians retook Mayence, and F. lost all his property, including his books and manuscripts. He then writes to a friend: 'If I could only scrape together £400, I would learn Persian and Arabic, and go overland to India to gather new experience;' but about this time he seems to have been suffering from rheumatic gout, which gradually increased in severity, and which terminated his life on the 12th of January 1794. Besides numerous translations, and the account of Captain Cook's voyage, his most important works are *Kleine Schriften, ein Beitrag zur Ländes- und Völkerkunde, Naturgeschichte und Philosophie des Leben* (6 vols., Berlin, 1789–1797), and *Ansichten vom Niederrhein, von Brabant, Flandern, Holland, England, und Frankreich* (3 vols., Berlin, 1791—1794). His widow, the daughter of Heine, but perhaps more widely known as Therese Huber, published a collection of his Letters, in 2 vols., in 1828—1829; and a complete edition of his works, in 9 vols., was published by his daughter and Gervinus, in 1843.

FORSTER, THOMAS IGNATIUS MARIA, an English meteorologist and physicist, born in London in 1789, and died in 1850. In 1812, he entered the university of Cambridge; in the following year, he produced an annotated edition of Aratus, and in 1816 he edited an edition of Catullus. In 1817, he published *Observations on the Influence of Particular States of the Atmosphere on Human Health and Diseases;* in 1824, *The Perennial Calendar;* in 1827, *The Pocket Encyclopædia of Natural Phenomena*, a work which has elicited the commendation of Quetelet and Humboldt; in 1836, *Observations sur l'Influence des Comètes;* and in 1850, *Annals d'un Physicien Voyageur*. A work entitled *Epistolarium Forsterianum*, consisting of a collection of original letters from eminent men, preserved in the Forster family, was published after his death, at Brussels, in 1852.

FORT, a term of peculiar meaning in British North America, applied to a trading-post in the wilderness with reference to its indispensable defences, however slight, against the surrounding barbarism. It has thus been often employed to designate merely a palisaded log-hut, the central oasis of civilisation in a desert larger, it may be, than Scotland.

FORT, FORTRESS (from Lat. *fortis*, strong), a stronghold, made secure by walls, and generally further protected by a ditch and parapet. For the construction of forts, see FORTIFICATION.

FORT ADJUTANT, an officer holding an appointment in a fortress—where the garrison is often composed of drafts from different corps—analogous to that of adjutant in a regiment. He is responsible to the commandant for the internal discipline, and the appropriation of the necessary duties to particular corps. Fort adjutants, of whom there are at present (1862) ten, are staff-officers, and receive 4*s.* 9*d.* a day in addition to their regimental pay.

FORT AUGUSTUS, a village at the south end of Loch Ness, 29 miles south-west of Inverness. A fort, intended to overawe the Highlands, was built here soon after the rebellion of 1715, on a small eminence on the loch. It can accommodate 300 men, but is commanded by neighbouring heights. It was taken by the rebels in 1745, and became the head-quarters of the Duke of Cumberland after the battle of Culloden. It is a quadrangle, with

m at each of the four corners. The twelve nders formerly mounted here have been d, but a few soldiers are generally stationed ort.

T GEORGE, a fortification in the north-east rness-shire, on a low sandy projection into ray Firth, here only one mile broad, opposite e, and nine miles north-east of Inverness. It nost complete fort in the kingdom, and was t a cost of £160,000, soon after the rebellion . to keep the Highlanders in subjection. It welve acres, and can accommodate 2000 men. n irregular polygon, with six bastions, and s of 70 guns. It is defended by a ditch, way, a glacis, two lunettes, and a ravelin. It mated curtains, 27 bomb-proof rooms, bomb-agazines, and is supplied with water from ump-wells. It is, however, only secure from by sea.

T GEORGE (India). See Madras.

T MAJOR, the next officer to the governor mandant in a fortress. He is expected to and the theory of its defences and works, responsible that the walls are at all times otected. He is on the staff, and receives a day in addition to his half-pay.

T ROYAL, a fortified seaport of the French of Martinique, in the West Indies, is the of the colony. It stands on the west coast, y of its own name, in lat. 14° 35′ N., and 1° 4′ W. It has a population of about 12,000, ntains offices for the local government, bar-rsenal, and hospital.

T ST DAVID, on the Coromandel or east f Hindustan, belongs to the district of South nd presidency of Madras. It is three miles north of Cuddalore, and 100 to the south lras, in lat. 11° 45′ N., and long. 79° 50′ E. ace became British in 1691. It occupied a ent position in the great struggle for supre-etween England and France. From 1746 to t was the capital of the settlements of the power on the Carnatic; but soon afterwards, ifications having been demolished, it sank mparative insignificance.

T WILLIAM, a village in Inverness-shire, ie west base of Ben Nevis, 63 miles south-f Inverness, and at the south end of the nian Canal. A fort was originally built y General Monk, and afterwards rebuilt on er scale by William III. It is an irregular with ditch, glacis, ravelin, bomb-proof magaz-rd barracks for 100 men. It resisted sieges Highlanders in 1715 and 1745. It was one old keys to the West Highlands, and is now nferior to Oban as a centre for tourists to these romantic regions.

T WILLIAM (India). See Calcutta.

TÉ, in Music, the Italian term for loud; *mo*, as loud as possible.

TESCUE, Sir John, an eminent judge and on English law, descended from a Devonshire was the son of Sir Henry Fortescue, Lord stice of Ireland, and was born some time in gn of Henry IV. Educated at Exeter College, , he was called to the bar at Lincoln's Inn. 1441 was made serjeant-at-law. The follow-r, he was appointed Lord Chief-justice of the of King's Bench. In the struggle for the etween the Houses of York and Lancaster, he adhered to the latter, and is supposed to have r a time Lord High Chancellor of England. ampbell, in his *Lives of the Lord Chancellors* p. 367), under date February 17, 1461, says: 'If Sir John Fortescue ever was *de facto* chancellor and in the exercise of the duties of the office, it must have been now, after the second battle of St Albans, and at the very conclusion of the reign of Henry VI.' In March of that year, he fought at the battle of Towton for that monarch, and was attainted by the parliament under Edward IV. He accompanied the queen, Margaret of Anjou, and her young son, Prince Edward, on their flight into Scotland, and while there wrote a treatise in support of the claim of the House of Lancaster to the English crown. In 1463, he embarked with the queen and her son for Holland, where he remained for several years, intrusted with the education of the young prince. During his exile, he wrote his celebrated work, *De Laudibus Legum Angliæ*, for the instruction of his royal pupil. In the introduction, and throughout the dialogue, he designates himself 'Cancellarius.' It was when he was in Scotland that the title of Chancellor of England is said by some to have been conferred upon him by the dethroned monarch. He probably had the titular office of chancellor *in partibus* during his exile, but never exercised the functions in England. In 1471, he returned with Queen Margaret and her son; but on the final defeat of the Lancastrian party at the battle of Tewkesbury, where he is said to have been taken prisoner, finding that parliament and the nation had recognised the title of Edward IV., he submitted to that monarch, and, as a condition of his pardon, wrote a treatise in favour of the claim of the House of York. He was allowed to retire to his seat of Ebrington, in Gloucestershire, where he died in his 90th year. His male representative was, in 1789, created Earl Fortescue and Viscount Ebrington in the peerage of Great Britain.

FORTH, a river of Scotland, rises in the north-west of Stirlingshire, in the mountains between Loch Katrine and Loch Lomond, from two main branches, the Duchray, 16 miles long, from the east side of Ben Lomond, and the Avendhu, 12 miles long, flowing through Lochs Chon, Dhu, and Ard. These streams unite at Aberfoyle, and issue from the mountains. The F. then runs east and south-east along the borders of Perth and Stirling shires, with numerous windings, in a wide valley abounding in picturesque scenery. It passes Stirling, and a little above Alloa it widens out into the Firth of Forth. The F. is only 30 miles long in a straight line from its source to the mouth of the Devon; but, owing to its sinuosities, its real course is more than twice that length. It is navigable for vessels of 100 tons to Stirling. Its chief tributaries are the Teith, the Allan, and the Devon. The upper parts of the F. and Teith traverse some of the most romantic lake and mountain scenery in Scotland.

FORTH, Firth of, an arm of the sea, or the estuary of the river Forth, lies between the counties of Clackmannan, Perth, and Fife on the north, and those of Stirling, Linlithgow, Edinburgh, and Haddington on the south. It first extends 6 miles south-east from where the Devon joins the Forth; then, with an average breadth of 2½ miles, it runs 10 miles to Queensferry; and finally, it extends 36 miles north-east, gradually expanding in width to 15 miles between Fife-ness and Tantallon Castle on the coast of Haddingtonshire. Its waters are from 7 to 30 fathoms deep, and encircle the Isle of May, Bass Rock, Inchkeith, Incholm, Cramond Isle, &c. On the coast are many fine harbours. St Margaret's Hope, above Queensferry, is one of the safest roadsteads in the kingdom. The chief rivers which fall into the firth are the Forth, Carron, Avon, Almond, Esk, and Leven. The counties along its shore are the most fertile and best cultivated in Scotland, and include the maritime towns of North Berwick,

Musselburgh, Portobello, Leith, Queensferry, Grangemouth, Culross, Burntisland, Kirkcaldy, &c.

FORTHCOMING, in the Law of Scotland, is an action by which an arrestment is made available to the arrester. The arrestment secures the goods or debts in the hands of the creditor or holder; by the forthcoming the arrestee and common debtor are called before the judge to hear sentence given, ordering the debt to be paid, or the effects to be delivered up to the arresting creditor. (Bell's *Law Dictionary.*)

FORTIFICATION, a term derived through the Italian from the Latin *fortis* and *facere*, means literally the 'making strong' of any place whatever, be it a town, an arsenal, a camp, a mere house, or the extended position of an army occupying a tract of country, a province, or even a kingdom. In effect, the term is limited to strengthening by means of walls, ditches, or other stationary obstructions, aided more or less by artillery, which may impede hostile advance.

Fortification cannot pretend to render strongholds impregnable, for no works, however skilfully devised, will withstand the continued fire of well-directed artillery, backed by energy and discretion on the part of assailants: its aim is to enable a beleaguered garrison to hold out, without losing ground, until it can be relieved by the advance of allies operating in the field. In fortifying a place, the engineer usually proceeds upon some defined system of entourage; but if he hope for success, his science must be sufficiently elastic to adapt itself to all the natural features of the locality; and from this it follows that a system perfect in theory, and of universal application, will in practice have to undergo modifications, differing in almost every instance.

The origin of the art is involved in an obscurity which history need not hope to penetrate. The earliest records of all nations speak of walled cities and forts.

The prime element of all fortification is the parapet (from Italian *para*, before; *petto*, the breast), which may be a wooden stockade, a wall of masonry, or a mound of earth, and is intended to give more or less cover to the defender from the projectiles of his adversary, while he is still able to use his own weapons against the latter. The simplest form of parapet being the mound of earth, the ground adjoining it would probably be dug up for its formation, and from this would almost unconsciously ensue the ditch, as an additional means of separating the assailant and the assailed. Starting, then, from this parapet and ditch or fosse, as the elementary forms of defence, it will be well, before proceeding to describe the ancient and modern systems, to give concise practical definitions of the parts, adjuncts, and technical names of a fortification.

The first duty of a defender is to prevent, as far as possible, the enemy's near approach to any of his works. In developed systems, this is sought to be done by bastions, &c. (of which hereafter), which stand out at angles to the general line, so as to afford a fire commanding all parts. But as cases occasionally happen of troops, defended by a mere straight parapet and ditch, having to withstand the advance of the enemy, it is necessary to adopt every measure which can obstruct his path, harass his advance, and, if possible, aid in cutting off his retreat in the event of failure.

Abattis (q. v.) are among the simplest obstacles to be improvised, consisting of trees cut down, shorn of their leaves and smaller twigs, having their branches pointed, and then laid close together, in one or more lines parallel to the works, branches outward, and trunks imbedded or pinned down in the earth. Accoutred troops must remo before they can pass, and the operation of under fire from the besieged is a very ser indeed.

Chevaux-de-frise (q. v. for derivation and tion) are pointed iron or wooden rods fixed c in a wooden beam, and until removed ofl complete obstacle to progress. They are ver in a breach or other unclosed portion of and are now made in pieces, so as to be and yet ready for immediate putting toget cheval-de-frise is usually 12 feet long, with 9 inches square.

Chausse-trapes, or *Caltrops* (q. v.), give annoyance to troops advancing, and are es dangerous in cases of night-attack. Their however, more general formerly than it is nc

Trous-de-loup (wolf-traps), which are dee dug, and armed at the bottom with spikes trees cut down and their stumps pointed, i harrows, broken sword-blades, bayonets, similar annoyances, are resorted to as exped gain time, and thereby insure a more deadly the assailants. They are frequently constr the glacis of a work.

Fraises and Stockades represent another additional defence, and are stout posts driv zontally or perpendicularly into the earth,

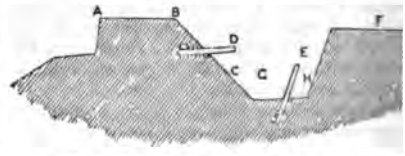

Fig. 1.—Fraise and Stockade (in section)

close rows. Fig. 1 shews the use of both defences in the ditch of a fortress, and it will ceived at once how formidable to an attackin solid lines of these posts must be. The s forms likewise, at times, a good substitute parapet itself, particularly when the direct artillery is unlikely to be brought against i warfare with barbarous tribes, or in a work very crest of a steep hill. In this case it is constructed of two rows of strong palisades imbedded in the ground: the outer nearly square, planted with three-inch intervals be the second about six inches in diameter, closu spaces behind. Every second small palisad

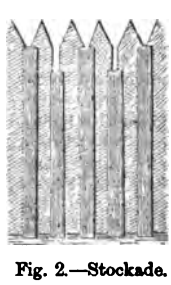

Fig. 2.—Stockade.

Fig. 3.—Double Stock

short a few inches, so as to leave a loop musketry-fire (as in fig. 2). A hill protected manner is shewn in fig. 3.

CONSTRUCTION OF THE PARAPET.—The of the parapet being to defend, or *défilade* a

ground behind it, its height must be so that missiles passing across its crest to strike the troops mustered behind. ıum width defiladed to allow of safe com- ı for troops behind, and actually defend- feet; but if the men have to be drawn , not less than 90 feet will suffice. The ıscertaining the height of parapet neces- rticular cases will be seen from the next ig. 4). Let A be the position at which t is to be made, and AB the space which

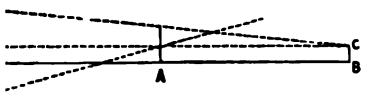

Fig. 4.

ired to defilade to a height throughout 3C. D, D_1, D_2, are three points, accord- supposed country round, from which fire ıal at the parapet—one, D, being on the others on ground respectively higher and n the parapet: if lines be now drawn e points to C, their intersection with a ılar, raised on the point A, will shew ion necessary for the parapet protecting AB to the height BC. From this, the ıge will be apparent of constructing a ritliin range of higher ground, as for ra foot of elevation in the commanding portionate addition must be made to the the parapet. In practice, the ordinary or a level is eight feet high, which : the depressed trajectory of a spend-

See PROJECTILES. If the parapet be ground above the attacking position, it wered, according to the angle, to about six nches, the height necessary for a man up to be thoroughly protected. On the ıd, if the position, A, be lower than the ıpied by the assailant, the parapet must ; as 12 feet forms the limit to which can conveniently be thrown up, further essary for protection is obtained by sinking l to be defiladed before the parapet's base. ing for these heights, the instruments used *-rods*, which are fixed in the ground at D ith the normal height of a man marked a third rod at A is then marked at the re the line of sight between the normal the two others intersects it, and so shews : of the parapet.

egoing parapet has been provided only as breastwork, deriving its safety solely from e in a direct line upon the besiegers; but ; such a rampart would be exposed to the age of holding but little command over the *carp* (part cut away) at its foot; so that, hed under cover, an enemy could readily self therein. To guard against this a work so that the fire of one part shall take in nemy advancing against another part. See ıere ABCDE is a flanked or reciprocally parapet, in which it is evident that the AB, DE, must take in flank any force ı BC or CD, while the latter also, in like lank AB. DE, themselves. In a flanked f this sort, the angles, A, C, E, which wards the country, are technically termed *gles*; those at B and D, *re-entering angles*. ed parapet has often, likewise, the power ing larger spaces than the simple line of parapet, since the salient angles can, perhaps, be brought on elevated ground; while the re-entering angles, though with less elevation, may in some

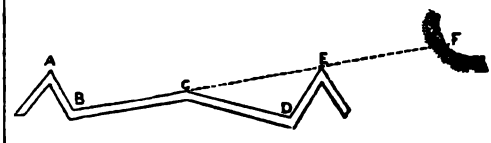

Fig. 5.

degree compensate that defect by greater distance from the front. A disadvantage of flanked defences is, that the hostile fire crosses the parapet at a less angle than in the straight line, and may, therefore, be more deadly; indeed, the object of the assailant will always be to obtain an enfilade fire *along* one or more parapets of the defence, as (in fig. 5) an enemy posted at F, would be able to sweep the complete line of the parapet CB. To avoid this, the engineer who constructs the works must ascertain minutely the elevation of the surrounding points, and make his salients at such angles that the prolongation of his parapets towards the enemy shall always fall on low ground, whence no command can be obtained.

Now, where the salient angle becomes somewhat acute, and there is an enemy on both fronts, the soldiers defending the right parapet, and standing on its banquette, would be exposed to a *reverse* or back fire from the enemy in front of the left parapet, beyond the defilading of which they would doubtless be. As a remedy, an internal parapet, called a *traverse*, or, from its duty, a *parados*, is raised between the parapets of the salient, its height being determined on precisely the same principles as were made use of in regard to the original parapets.

Where both the faces of the salient are unavoidably so placed as to be enfiladed, a small work, called a *bonnet*, is constructed at the angle, which consists in the parapet being so raised up to an extra height of twelve feet if necessary, and at the same time widened, that the banquette shall be defiladed. If a height of twelve feet is insufficient to defilade the whole length of the banquette, traversing parapets must be raised at right angles to the face of the work, and within it, at such distances that the whole may be safe: of course, the height of the bonnet and of the traverses must be decided on rules analogous to those explained in fig. 4. The increased height of the parapet of the bonnet renders it necessary to have two or more banquettes at that portion of the work, with steps to aid the ascent (see section in fig. 6); as AB, the crest of the general parapet, with banquette at C; and DE, the bonnet, with banquettes at F and G.

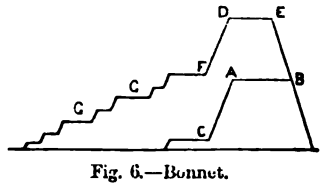

Fig. 6.—Bonnet.

In enclosed works—i.e., in works entirely surrounded by parapets—the position of the parados is of vital importance; and they have often to be devised with great ingenuity, so as to protect the defenders from reverse fire in any direction, and at the same time not to prevent necessary communication between different portions of the fortress.

Relief means the height of any point in a work above the plane of construction, which may be the line of sight or the bottom of the ditch. In the latter case, the relief of the parapet is an important

it is in estimating the resisting power of a work, as it represents the vertical equivalent of the obstacle which will be offered to a foe.

When the relief of the parapet's crest has been determined, its thickness becomes the next consideration. The dimensions are laid down on the ground, and depend, first, on the angle at which the material to be used will pile; and then, on the nature of the missiles against which the parapet is to afford protection. For example, an earthwork of from three to four feet suffices to resist musketry; a thickness of 18 feet is impervious to the 24-pounder, while larger guns can pound through even more solid obstructions.

Taking fig. 7 as an example, in which *a* is the crest of the parapet, then the banquette *c* should

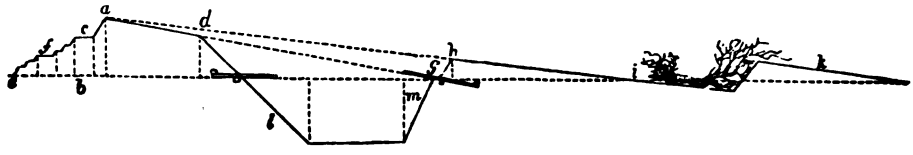

Fig. 7.—Section of Parapet, Ditch, and Glacis.

for convenient firing, be four feet three inches below *a*; its width three feet, if for a single line of soldiers; four feet six inches for a double rank; its slope should be one in twelve, that water may run freely off. The base, *be*, of the slope, up which the men mount to the banquette, should be twice its height *bc*, and cut into steps with inclined sides, to allow of easy ascent; and where the height is considerable, a supplemental banquette (on which relieving-men can, if necessary, reload), is desirable. The interior slope, *ac*, of the parapet should be one in four; the exterior slope, or *plongée*, *ad*, intended for the direction of the guns on an assailant, one in six, a deviation being permitted between one in nine and one in four; but the crest being more liable to destruction as the slope of *ab* is augmented, it is best to keep it as small as circumstances will allow; one in six is the ordinary slope in English fortification, the angle of the interior slope being constant. In some continental services, however, the angle, *cad*, is kept constant at 100°, by increasing the deviation of the interior slope of the parapet from the perpendicular as the plunge of the exterior is greater. The flatter, however, the crest of the parapet is the better, as sand-bags are in certain cases ranged on it to form cover for the men, while they fire through loopholes left in this additional defence. Earth of medium tenacity maintains its position properly when sloped at an angle of 45°; and this is the greatest angle which can be counted on for the outer slope of the parapet. The scarp, *l*, and counterscarp, *m*, of the ditch need not have so great an incline, as the ground in which they are cut has usually had time, and the footsteps of ages, to consolidate it. In such cases, the base of the triangle is frequently made equal to half the perpendicular. Cases, of course, occur in which steeper banks are considered indispensable; and then, to prevent slips, the earth must have a coating to keep it up, which may be of fascines, hurdles, planks, or sand-bags, for temporary works, or those constructed in the midst of action; while the most solid masonry performs the same function in fortresses of a more permanent nature. This outer coating is denominated a *revêtement*.

In fig. 7, *ghi*, is the *glacis*, formed during the excavation of the ditch, and having for object the bringing of an advancing enemy into the best line of fire from the parapet. The base and perpendicular of its interior slope, *gh*, should be equal; the slope of the outer face should be one in twelve, unless the slope of the ground render some different angle desirable. An advanced glacis, *k* in fig. 7, is sometimes adopted, in order that the enemy may the sooner be brought under fire. It is absolutely necessary that the crest of the parapet should be five and a half feet higher than the crest of the glacis, as, otherwise, an assailant having reached the latter, would be able to pour a musketry-fire over the former into the work. No part of any glacis, whether near or advanced, should be more than two feet below the line of fire from the parapet—i.e., the line joining the crests of the parapet and glacis continued; if more depth be allowed, the enemy may advance in a crouching posture, without being liable to be hit. Advanced glacis are usually made of earth thrown up in prolonging beneath the ground the plane of the preceding glacis. They may be defended entirely from the parapet, in which case palisades or abattis are often fixed (as in fig. 7) to delay the advancing enemy when at the point of greatest exposure. On the other hand, these advanced glacis are occasionally defended by a series of advanced intrenchments, and one abandoned, one by one, as the defenders are driven in towards their main work.

The dimensions of the ditch depend in some measure on the amount of earth required for the parapet and glacis; but in addition to being the mine whence the materials for the latter work are drawn, the ditch must also oppose a considerable obstacle to any hostile advance. To do this effectually, the minimum width across the top is 18 feet; its depth need only be limited by the trouble of raising the earth; but in practice 12 feet is found the greatest which can be conveniently arrived at. Having ascertained the profile of the parapet, with its banquette or banquettes, bonnet, traverses, glacis, &c., it becomes a mere matter of mensuration to compute the area of a section, and multiply it by the length, and so to obtain the cubic feet of earth required. With the length of the ditch known, a very simple calculation then exhibits its width and depth—a small allowance being made for the fact that the earth, dug out from the ditch, where it has probably been long compressed, will occupy somewhat more space when thrown up, and broken into clods, for forming the parapet.

The *scarp*, or inner face of the ditch, is more difficult of ascent by the assailant, when in a continuous line with the parapet (as in fig. 7); but sometimes it would be dangerous to construct the work with this continuity, as damage to the scarp would jeopardise the stability of the parapet. In these cases a narrow step, called a *Berm* (q.v.) of from two to four feet, is made to intervene between the foot of the parapet and top of the scarp: as a precaution, it is covered with all possible obstacle to any lodgment being effected on it by the enemy. When a berm is employed, greater steepness is usually given to the scarp.

The *counterscarp*, or outer sloping side of the ditch, should be somewhat steeper than the scar

ttom of the ditch should slope from both rwards the centre, to carry off the water; tacles should be scattered about to prevent ıy from forming his troops in the ditch.

HWORKS IN FIELD FORTIFICATION.—As the cadily constructed, earthworks naturally end themselves to the engineer, who, in l, is called upon to defend the position of y against sudden attack. Their utility has ewn in their employment from the earliest and modern experience tends to prove that ıarapets are of all fortifications among the fficult to overcome. An army manœuvring ı superior force, can scarcely hope to avoid being thrust upon it, unless, strengthened lworks, it be rendered more nearly equal dversary. Napoleon, Marlborough, Eugène, ton, have given their names as witnesses to ispensability of such works. The Russian s at Borodino made the French victory so ary a triumph that it was useless to the

A few redoubts at Pultowa saved Peter eat from total defeat by his formidable ı rival. The world-famed lines of Torres enabled Wellington with 50,000 troops, half n were untried Portuguese, to withstand for nths, and ultimately to drive back, the victorious army of 70,000 French, under ommanders as Masséna, Ney, and Junôt. rthworks surrounding Sevastopol partook of the nature of fieldworks for the protec- a large army, and history will not forget to the resistance they offered for almost a the best troops of the civilised world.

ı line, whether of earth or masonry, to be , it must combine artillery fire with that of y. The guns will generally be so placed as uand some specific line of approach, such as e, a line of abattis, or some portion of the They should themselves be as little exposed ible, nor should the gunners be uncovered ıan is absolutely requisite. To effect this, is generally made to fire through an *embra*v.) in the parapet, instead of over the latter. brasure is a cutting through the solid para- inches wide at its inner extremity, and ls half as much as the width of the parapet. ı where it is necessary, for proper command, e line of fire should not be lower than the the parapet, the embrasure is made through itional parapet—raised, as in the previous the bonnet, above the original one. The of the embrasure is called the *sole*, and lownward sufficiently to allow of a certain ion being given to the gun. The remainder apet below the sole is the *genouillerè* (from a knee), and in field fortification should be nd a half feet high; the portion between brasures is the *merlin* (Ital. *merlone*, battle- and an embrasure need not cut the parapet licularly, an angle being admissible, when que fire is necessary. When, however, the obliquity would exceed 70°, it is usual, in order that the thickness of the parapet should not be too much diminished, to form a projecting angle in it, ı which the embrasure is cut (as in fig. 8). es of the embrasures are *cheeks*, and require

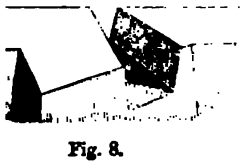

Fig. 8.

rbette is a platform raised behind a parapet, higher than the general interior, with a view to guns being fired from it over the parapet.

There are certain fixed rules in all fortification, such as:—1. The length of lines must never exceed musketry range, or the flanking-works would become ineffective for their object. 2. The angles of defence should be about right angles. 3. Salient angles should be as obtuse as possible. 4. Ditches should have the best possible flanking. 5. The relief of the flanking-works must be determined by the length of the lines of defence. 6. The value of almost every detached work depends on the support it can give to or receive from an army or other work or works. 7. The reduction of every fortified work is merely a question of time; and a work fairly surrounded is sure to fall, unless relieved from without.

Fieldworks, which, it must be borne in mind, are intended merely to support or strengthen an army, may either have a complete circuit of parapets, or may be open at the gorge in the rear. The latter are, of course, the simplest; but they are only available in positions which the enemy cannot turn, or where protected by the sweeping fire of other works behind. Of this class the *Redan*, a mere salient angle (see fig. 9), is the simplest and the representative form. Of the closed forts, there are *Redoubts*, usually square; *Star-forts*, now considered objectionable; bastioned forts, as in fig. 10, which flank their own ditches almost perfectly, while scarcely susceptible of being flanked themselves. To understand the nature of a single bastion, see A (fig. 10), which represents one at the corner of a square work; *ab* is the left *flank*, *bc* the left *face*, *cd* the right *face*, *de* the right *flank*; *ae* is the *gorge*; *af*, *fe* are the *demi-gorges*, being continuations of the sides, or curtains, of the work; *a* and *e* are the left and right *curtain angles*; *b* and *d*, the left and right *shoulder angles*, and *c* is the *flanked angle*.

Fig. 9.—Redan.

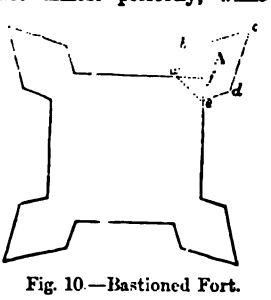

Fig. 10.—Bastioned Fort.

Continued lines are simple parapets, either connecting fortified posts, or covering the front or flank of an army. Redans joined by curtains (as in fig. 11) are those most easily constructed; but as the ditches can only be defended by an oblique fire, the curtains are occasionally so broken as to form nearly right angles with the faces of the redan, as in the dotted line; they then become *lines of tenailles*.

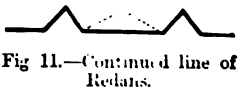

Fig. 11.—Continued line of Redans.

Lines en Crémaillière have long faces with perpendicular flanks. *Lines with intervals* are often as effective as continued lines. They consist of detached works, in two lines, within musketry

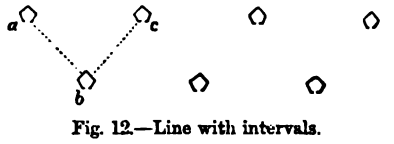

Fig. 12.—Line with intervals.

fire of each other. The re-entering angle, *abc* (fig. 12), should as nearly as practicable be a right angle. The celebrated lines of Torres Vedras, before adverted to, consisted of 150 detached ferts.

Tête-du-pont, is a work constructed to cover the approaches to a bridge, and will be found described under BRIDGE-HEAD.

A *tenaille* is the reverse of a redan, and consists of two faces forming a re-entering angle: it can only be used in connection with some other work.

A *flèche* is a breastwork of two faces, forming a salient angle, constructed on the exterior of a glacis, usually at its foot, in order to defend the ground before a bastion or ravelin.

Having now explained the principal forms which elemental works of fortification are made to assume, we proceed to describe—very briefly, of course—the systems into which these have been incorporated for the defence of fortresses, towns, and other permanent purposes. It will merely be necessary to state, in addition to what has been already written, that a *rampart* is a raised structure of earth or stone, above the mean level of the country, on which the parapets, &c., can be thrown up, and which affords to the town or space protected the extra cover of its height, while it elevates the inner works sufficiently to enable them to command and fire over those situated exteriorly to themselves. It need scarcely be said that a line which can be made of earth may equally be constructed of any other material which circumstances may render desirable, the maximum resistance and minimum liability to splinter being the qualities to be chiefly considered.

SYSTEMATIC FORTIFICATION FOR PERMANENT WORKS.—Adverting to the most ancient fortifications mentioned in history, we find Greek cities surrounded with walls of brick and rubble, and occasionally of stone in huge blocks. Babylon had a wall of prodigious circuit—100 feet high, 32 feet thick, and surmounted by towers. Jerusalem, at the time of Vespasian's siege, had similar walls with masonry of enormous solidity. These seem to represent fortification as it stood from the time of that emperor to the introduction of cannon for breaching purposes. Then the square and round towers, which had formed sufficient flanking defence against arrows, proved useless when cannon-balls, fired from a distance, were the instruments of assault. At the same time, the walls, which had resisted battering-rams, crumbled to atoms under the strokes of artillery.

Fortunately, however, the art of defence has always made equal progress with that of attack; and, early in the 15th, if not late in the 14th c., the Italians had commenced to flank their walls with small bastions. The bastions at Verona, built by Micheli in 1523, are usually looked upon as the oldest extant specimen of modern fortification. Tartaglia and Albert Dürer, painter and engineer, were early in the field. In most of the earlier systems the face of the bastion was perpendicular to its flank. The first principles were successively improved by Marchi, an Italian, who died 1599, by Errard Bois-le-Duc, and De Ville, under Henry IV. and Louis XIII. of France. The Count de Pagan, whose treatise appeared in 1645, did much towards demolishing previous errors, and laid the basement of that science which Vauban subsequently wrought almost to perfection. Born in 1633, Vauban had a genius which penetrated in every direction, equally in the ways of war and in those of peace. He might possibly have taught how fortresses could be rendered impregnable, had not the restless ambition of his master, Louis XIV., led him to demonstrate, first, that the reduction of any work was a mere question of time and powder. His talent so improved the system of attack, that even he himself could not construct a rampart that should withstand the fire conjured up against it by his discoveries. He constructed 33 new fortresses, improved above 100, and conducted personally more than 50 sieges. To him are soldiers indebted for the sweeping fire of ricochet, and to him in a degree for the traverses which endeavour to render it harmless. Coehoorn, director-general of the fortresses of the United Provinces, was the contemporary, rival, and opponent of Vauban; his master-piece is Bergen-op-Zoom.

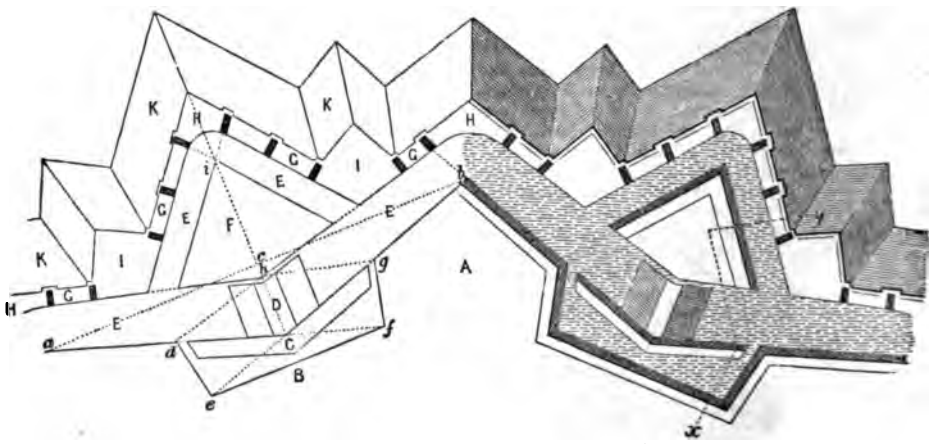

Fig. 13.—Vauban's First System; Ground-plan:
A, bastion; B, curtain; C, tenaille; D, caponnière; E, ditch; F, ravelin; G, covert-way; H, salient place of arms; I, re-entering place of arms; K, glacis.

Cormontaigne, Belidor, Montalembert, Bousmard, and Carnot may also be mentioned as conspicuous masters in the science.

Irrespective of irregularities in the form of the place to be defended, a particular polygon is selected as that on which the lines of defence are to be drawn. Each side of this is a *face of defence*, and the length of a side is rarely made greater than 300 yards.

Vauban's first system is shewn in fig. 13 as regards the outline of its ground-plan; fig. 14 displaying the same in profile.

In this instance, the polygon taken is an octagon. Let *ab* (*fig.* 13) be a side of this polygon; bisect this in *c*, and draw a perpendicular to *ab*. On this, inwards, mark off *cC* one-sixth of *ab*; join *aC*, *bC*, and produce the lines; then from *a* and *b* respectively mark off *ad*, *bg*, each equal to $\frac{1}{3}$ *ab*, for the faces of the bastions. Next, from *a* and *b* as centres, with radius, *ag*, describe arcs cutting *aC*, *bC*, produced in *f* and *e*; join *de*, *fg*, for the flanks of bastions, and *ef* for the curtain of the work. The

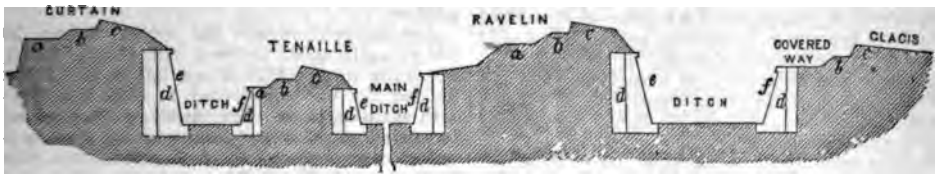

Fig. 14.—Vauban's First System; Profile:
a, *b*, banquettes; *c*, parapet; *d*, revêtement; *e*, escarp; *f*, counterscarp.

first line of defence is then complete, the necessary parapets, &c., being of course raised on the site laid out. From an examination of this, it will be seen that the whole space in the front is covered. The faces of the bastions and the curtain command more or less the entire front, while the bastion flanks sweep along the faces of adjoining bastions and along the curtain. In front, however, of the apex of each

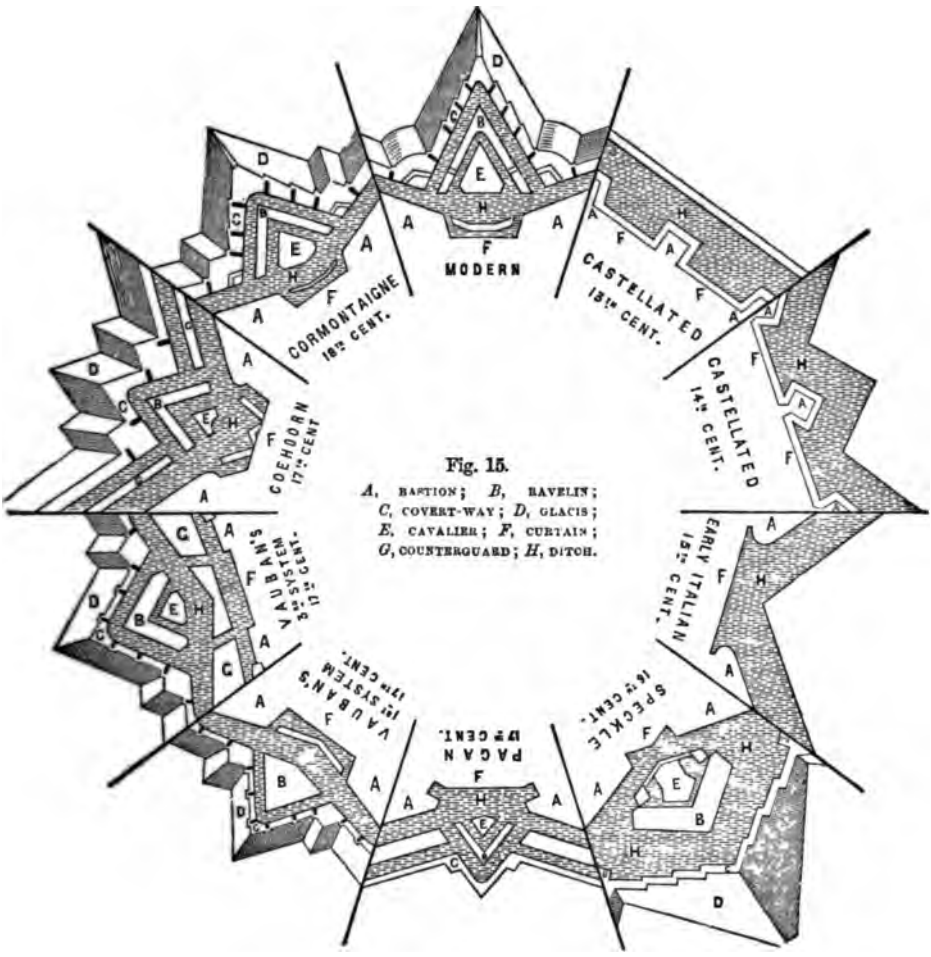

Fig. 15.
A, BASTION; *B*, RAVELIN;
C, COVERT-WAY; *D*, GLACIS;
E, CAVALIER; *F*, CURTAIN;
G, COUNTERGUARD; *H*, DITCH.

bastion, the line of advance is only covered by an extremely oblique fire. To obviate this, a ravelin, *F*, is constructed on the further side of the main ditch, which commands the doubtful fronts, and, at the same time, forms an outwork capable of assisting in the general scheme of defence. To trace the main ditch, describe from the flanked angle of the bastion, *a* or *b*, an arc with radius 30 yards (if dry

ditch, 36 if wet), and from these arcs draw tangents to the shoulders, *d* and *g*, of the opposite bastions. These tangents, meeting in the line *cC*, form the counterscarp line of the main ditch. From *h*, the re-entering angle of the counterscarp, set off 100 yards along the perpendicular to *i*, which will be the apex of the flanked angle of the ravelin. From *i*, draw lines to points situated in the faces of the bastions, 10 yards from the shoulder angles; these lines to the points intersecting the counterscarp give the faces of the ravelin. The ditch of the ravelin is 20 yards wide, with counterscarp parallel to the escarp. The zigzag line now arrived at gives the inner side of the covert-way—10 yards wide—behind the glacis, which last slopes gradually towards the country, and is ordinarily the outer work of all. The tenaille is a comparatively low parapet sweeping the depressed interior of the ravelin, and commanded by the bastions and curtain.

The caponier, forming a communication between the tenaille and the ravelin, consists of a passage between two low parapets, each with a glacis sloping towards the ditch, which is swept from the work.

Nine feet clear are allowed round the traverses on the covert-way; at the re-entering angles of the covert-way, *places of arms* are formed by setting off 50 yards on each side, and with this as gorge, advancing faces inclined to each other at 100°. If the polygon had been a square, *cC* would have been $\frac{1}{4}$ *ab*; if a pentagon, $\frac{1}{7}$ *ab*; and for any polygon of more sides than seven, $\frac{1}{8}$ *ab*.

Vauban's second and third systems were those in which he adapted old walls to his modern improvements. Availing himself of the works already formed, he added counterguards in front of the corner-towers, thereby making hollow bastions, and avoiding the necessity of entirely rebuilding.

Coehoorn's system had counterguards in front of the bastions and parallel to them. The flanked angle of his ravelin had a fixed value—viz., 70°.

Cormontaigne widened the gorge of his ravelin, thereby reducing the length of the bastion face available for breaching from without. He also revived the step-like formation of the covered way, originally seen in Speckle in the 16th c., and which gives defenders a continued line of fire from each traverse along the covert-way.

The modern system differs but little from that of Cormontaigne. The re-entering places of arms have circular fronts instead of angular; the angle of the ravelin is fixed at 60, and all the best points of older styles are associated.

Fig. 15 is intended to present at one view a representation of the systems in force since artillery came into common use, as well as the gradual transition from square towers on castle walls to flanked bastions on modern lines. The elements of fortifying against shipping will be found under MARINE FORTIFICATION; the principles of attacking fortresses generally, under SIEGE, and MINES, MILITARY.

FORTIGUE'RRA, NICOLO, an Italian poet, was born at Pistoja, November 7, 1674. Destined from youth for the church, he proceeded to Rome at an early period, where the power of the prelate Carlo A. Fabroni, who was his relative, speedily secured him advancement, and where he was ultimately raised to the dignity of prelate and papal chamberlain by Clement XI. An ardent cultivator and protector of letters, it must be owned that F.'s own compositions are more prized for a certain rich joviality of imagery, and profuse facility of language, than for any salient beauty of style or conception. His chief work, *Il Ricciardetto*, was originally commenced in confutation of friends, who maintained that the striking ease and fluency of Ariosto, Berni, and other poets of a similar school, were but apparent, and in reality the fruit of deep art and severe labour. F., in *a few hours* threw off an entire canto of *Il Ricciardetto*, strikingly in imitation of the above poets, and continued the work at random much beyond its originally designed limits. It was published in 1738, two years after his death, and met with unequivocal favour, notwithstanding the incredible incidents and licentious images with which it is replete. F. died 7th February 1735.

FORTRO'SE, or FORTROSS, a parliamentary and royal burgh, seaport, and watering-place in the east of Ross-shire, on the west side of the Moray Firth, opposite Fort George, ten miles north-north-east of Inverness. Pop. (1861) 928. It unites with Inverness, Forres, and Nairn in sending a member to parliament. F. had a fine cathedral and a bishop's palace; but both of these buildings were partially destroyed under Cromwell, and the stones sent to Inverness, to be used in building a fort there. It has a good trade in various kinds of produce, as pork, eggs, all sorts of grain, and potatoes. In the 16th c., F. had a considerable trade, and is said to have been the seat of arts, science, and divinity in the north of Scotland. Chanonry, with which it was united in 1444, was formerly the see of the bishops of Ross.

FO'RTS AND FORTALICES. The military power of the state is intrusted by the constitution of this country to the sovereign. After having been unconstitutionally claimed by the Long Parliament in the time of Charles I., it was again vindicated for the crown by 2 Car. II. c. 6. This branch of the royal prerogative extends not only to the raising of armies and the construction of fleets, but to the building of forts and other places of strength. Sir Edward Coke lays it down (1 *Inst.* 5), that no subject can build a house of strength embattled without the licence of the king; and it was enacted by 11 Henry VII. c. 18, that no such place of strength could be conveyed without a special grant.

FORTU'NA, called by the Greeks, *Tyche*, was in classical mythology the Goddess of Chance. According to Hesiod, she was a daughter of Oceanus; according to Pindar, a sister of the Parcæ. She differed from Destiny or Fate, in so far that she worked without law, giving or taking away at her own good pleasure, and dispensing joy or sorrow indifferently. She had temples at Smyrna, Corinth, and Elis. In Italy, she was extensively worshipped from a very early period; and had many names, such as *Patricia*, *Plebeia*, *Equestris*, *Virilis*, *Primigenia*, *Publica*, *Privata*, *Muliebris*, *Virginensis*, &c., indicating the extent and also the minuteness of her superintendence. Particular honours were paid to her at Antium and Præneste; in the temple of the former city, two statues of her were even consulted as oracles. Greek poets and sculptors generally represented her with a rudder, as a symbol of her guiding power; or with a ball, or wheel, or wings, as a symbol of her mutability. The Romans proudly affirmed that when she entered their city, she threw away her globe, and put off her wings and shoes, to indicate that she meant to dwell with them for ever.

FORTUNATE ISLANDS. See CANARIES.

FORTUNA'TUS is the title of one of the best people's books (*Volksbücher*) ever written. It originated about the middle of the 15th c., though many of the tales and legends included in it are of much older date. The opinion that it was worked up into German from a Spanish or English original may be considered as set aside. The substance of the book is that F., and his sons after him, are the

ors of an inexhaustible purse of gold and a g-cap, which however, in the end, prove the of their ruin. The moral is, that worldly rity alone is insufficient to produce lasting ess. The oldest printed edition of the book xtant bears the date Frankfurt am Maine, Later German editions mostly bear the title, *atus, von Seinem Seckel und Wunsch-hütlein* natus: Story of his Purse and Wishing-cap. 1530; Nürnb. 1677; and Basel, 1699). It n reprinted in Simrock's *Deutsche Volksbücher* . Frankt. am Maine, 1846). Various French s of the German story have appeared from time, as the *Histoire de Fortunatus* (Rouen, which served as the groundwork of the *Avennimenti de Fortunatus e de' Suoi Figli* s, 1676). From the German original, have rung, among others, the Dutch version *Een Historie van Fortunatus Borse en van Zijnen hoed* (Amst. 1796); later, the English *History unatus and his Two Sons* (London, no date); anish *Fortunati pung og önskehat* (Kopen. 672, 1695, 1756, 1783); the Swedish *Fortu-*1694); and about 1690, two Icelandic versions, verse and another in prose. The first to ise the subject was Hans Sachs, in his *Der atus mit dem Wunschseckel* (1553), after comes the English Thomas Decker with his *at Comedie of Old Fortunatus* (1600), a work had the honour to make its reappearance in n about the year 1620. The most poetical of the story is that given by Tieck in his *ius* (3 vols., Berlin, 1816). See Grässe's *Die reise des Mittelalters* (Dresd. and Leips. 1842), rsch and Gruber's *Encyclopædie* (first sect.,).

TUNE-TELLER. Under the designation onds, in the Scottish Act 1579 c. 74, are d all who go about pretending to foretell e. The punishment inflicted on them by the is scourging and burning on the ear.

RUM, a Latin word, which originally signified en place,' and is probably connected with 'out-of-doors.' The Roman *fora* were places the markets and courts of justice were held. rmer were termed *fora venalia*, and the latter *dicialia*. Of the *fora judicialia*, the most t and celebrated was the *forum Romanorum*, *excellence*, the *forum magnum*, occupying the r now known as the *campo vaccino* (or cattle-t). It stretched from the foot of the Capito-ll, where the arch of Septimius Severus stands, temple of the Dioscuri, was seven *jugera* in and was surrounded by streets and houses. undary on the east and north was the *Sacra* which the side nearest the forum was left while on the other were corridors and halls, s those of the *argentarii* (bankers or money-rs). At a later period, the site of these was, most part, occupied by basilicas and temples. eastern portion of this space, were held the *Comitia* (q. v.) of the Romans—the *comitia* ; hence this part took the name of the *comi-*nd was distinguished from the forum strictly ed. Here were hung up for the benefit of the the laws of the Twelve Tables; and, after 304 he *Fasti* written on white tables to inform tizens when the law-courts were open. The , in the narrower usage of the word, probably to be employed as a market-place about 472 hen it became the place of assembly of the *a Tributa*. Of the later *fora venalia*, the prin-rere the *forum boarium* (the cattle-market), *rum suarium* (pig-market), *piscatorium* (fish-t. *olitorium* (vegetable-market), &c. Public banquets for the populace, and the combats of the gladiators, were, in the time of the republic, usually held in the great forum, which also contained monuments of various kinds, of which may be mentioned the famous *Columna Rostrata* of C. Duilius, erected in memory of his victory over the Carthaginians. The rostra, or platforms from which public orations were delivered, formed the boundary between the forum in its narrower usage and the comitium. After the time of Julius Cæsar and Augustus, the Forum Romanorum lost the import ance it had previously derived from being the central point of Roman political life. The other two *fora judicialia* were the *Forum Julii* and the *Forum Augusti*. Compare Becker, *Handbuch der Röm. Alterthümer* (1 vol., Leipsic, 1843).

FORUM COMPETENS, in Law, is the court to the jurisdiction of which the party is amenable.

FOSCARI, Francesco, Doge of Venice from 1423 to 1457, a brilliant period of conquest and prosperity to his country, and of unexampled affliction to himself and family. Born about 1370, his aspiring ambition soon fired him with passionate eagerness to exalt his reign by the glory of conquest, and speedily involved the state in a severe conflict with the Dukes of Milan; which, however, the doge's great military ability in the end turned into a source of glory and aggrandisement to Venice. His triumph was embittered by the successive loss of three sons; and the one who remained to transmit the name, and succeed to the inheritance of the family, was, in 1445, denounced for having received bribes from the hostile generals, to use his influence with the doge in procuring less rigorous terms. Tried for this grave crime before the Tribunal of the Ten, and racked cruelly in view of his father, Giacopo Foscari was banished for life, under pain of death should he attempt to revisit his native land. In 1450, the assassination of one of the 'Council of Ten,' Hermolao Donati, was imputed, on what seem most unfounded grounds, to Giacopo, who was consequently summoned from his exile, tried, tortured, and banished a second time on still more rigorous terms to the island of Candia. Grown reckless through suffering, and longing to see his home and country on any terms, Giacopo petitioned the Duke of Milan to intercede in his behalf with the senate, a step which, by Venetian law, was punished as a high crime, and led to the unfortunate Giacopo being for the third time subjected to torture and renewed banishment, on entering into which he died of grief. The doge had vainly besought permission to resign a dignity grown loathsome to him, from its imposing the barbarous obligation of witnessing his son's torture; but in the end he was deposed, and ordered to vacate the palace in three days. At the age of 87, decrepit from years, and bowed by sorrow and humiliation, Francesco F., supported by his venerable brother, descended the Giant's Staircase, and passed out for ever from the ducal palace, the scene of such vain pomp and bitter misery. Pasqual Malapieri was elected in his stead in 1457, and at the first peal of the bells in honour of his elevation, F. expired from the rupture of a blood-vessel. Byron has written a tragedy on the subject, entitled *The Two Foscari*.

FOSCOLO, Ugo, an Italian author, was born about 1778, at Zante, one of the Ionian isles, and proceeded to Venice in his 16th year, where for a time he pursued his studies, repairing later to Padua to enjoy Melchiore Cesarotti's noble course of classic literature. His earliest efforts at poetical composition were strictly modelled on his favourite Greek classics; and, as early as 1797, his tragedy,

Il Tieste, was received with favour by a critical Venetian audience. The dismemberment of the Venetian states, decreed by the treaty of Campo Formio, bitterly incensed F.'s patriotic spirit, and inspired him with one of his most remarkable works, *Le Lettere di Jacopo Ortis*, which, owing to the fierce political excitement then prevailing throughout the entire peninsula, was received with immense popularity. F. repaired to Milan on its being declared the capital of the Cisalpine republic, and there obtained the grade of officer in the Lombard legion. On the downfall of the republic, he retreated with the French into Genoa, where, in the midst of the terrors of a rigorous siege, he composed two exquisite odes to *Luigia Pallavicini Caduta da Cavallo*, and *All' Amica risanata*. F. subsequently entered France with the intention of joining Napoleon's expedition against England, and prepared a much admired version of Sterne's *Sentimental Journey*, to exercise himself in English. On the failure of the plan, he returned to Milan, and prepared a splendid edition of Montecuculi's works, with notes and historical references—*Opere di Raimondo Montecuculi, per* Luigi Mussi (Milan, 1807—1808), a very rare edition. At this time, he also published his exquisite poem, in blank verse, *I Sepolcri*, which at once placed him among the classic authors of his country. In the same year, he was appointed to the chair of eloquence in Pavia, and continued to occupy the post, to the delight and benefit of his students, until the professorship was suppressed in all the colleges of Italy. His inaugurative address, *Dell' Origine e dell' Ufficio della Letteratura*, is a masterpiece of beautiful, noble, and patriotic writing. From the time F. lost faith in the sincerity of Bonaparte's intentions to his country, he not only ceased to worship his early idol, but employed the full powers of his wrath and sarcasm in denouncing his treachery. After various vicissitudes, F. finally sought refuge in Britain about 1816, and soon mastered the language sufficiently to contribute to the *Quarterly* and *Edinburgh Reviews*. In London, some of his best writings were published—viz., *Essays on Petrarca and Dante*, *Discorso sul testo del Decamerone*, *Discorso storico sul testo di Dante*, and various minor compositions. He died October 10, 1827, of dropsy, at Turnham Green near London. His works in prose and verse were published in Milan, 1822, by Silvestri.

FOSS, or FOSSE (Lat. *fossa*, from *fodio*, I dig), in Fortification, is a ditch or moat, either with or without water, the excavation of which has contributed material for the walls of the fort it is designed to protect. The foss is immediately without the wall, and offers a serious obstacle to escalading the defences.

FO'SSA ET FU'RCA, or PIT AND GALLOWS, was an ancient privilege granted by the crown to barons and others, which implied the right of drowning female felons in a ditch, and hanging male felons on a gallows.

FOSSA'NO, a town of Piedmont, in the administrative division of Coni or Cuneo, is situated on the left bank of the Stura, on a hill surmounted by an old castle, 14 miles north-east of Coni. It is surrounded with old walls, and is well built; but the houses are erected over arcades, under which run the footways, and thus the streets have a somewhat gloomy appearance. It has a handsome cathedral, ten churches, a royal college, and numerous minor educational institutions, silk-factories, paper-mills, and tanneries. Pop. 16,423.

FO'SSIL (Lat. *fossilis*, dug out of the earth), a term formerly applied, in accordance with its derivation, to whatever was dug out of the earth, whether mineral or organic, but now restricted to the remains of plants and animals imbedded in the earth's crust. They were formerly, and are sometimes still, called petrifactions. They occur in nearly all the stratified rocks, which have, on this account, been called Fossiliferous strata. It is difficult or impossible to detect them in the metamorphic rocks, for the changes that altered the matrix have also affected the organisms, so as either almost or altogether to obliterate them. In the fundamental mica-schist and gneiss they have escaped notice, if ever they existed; and it is only within the last few years that their presence has been detected in the gneiss and other rocks, which are the greatly metamorphosed representatives of the Lower Silurian Measures in the north of Scotland.

The conditions in which fossils occur are very various. In some Pleistocene beds the organic remains are but slightly altered, and are spoken of as sub-fossil. In this state are the shells in some raised sea-beaches, and the remains of the huge struthious birds of New Zealand, which still retain a large portion of the animal basis. In the progress of fossilisation, every trace of animal substance disappears; and if we find the body at this stage, without being affected by any other change, it is fragile and friable, like some of the shells in the London clay. Most frequently, however, a petrifying infiltration occupies the cavities left in the fossil by the disappearance of the animal matter, and it then becomes hardened and solidified. Sometimes the whole organism is dissolved and carried off by water percolating the rock, and its former presence is indicated by the mould of its outer surface, and the cast of its inner in the rocky matrix, leaving a cavity between the cast and the mould agreeing with the size of the fossil. This cavity is occasionally filled up with calcareous spar, flint, or some other mineral; and we thus obtain the form of the organism, with the markings of the outer and inner surfaces, but not exhibiting the internal structure. The most advanced and perfect condition of fossilisation is that in which not only the external form, but also the most minute and complicated internal organisation is retained; in which the organism loses the whole of its constituents, particle by particle, and as each little molecule is removed, its place is taken by a little molecule of another substance, as silica or iron pyrites. In this way we find calcareous corals perfectly preserved in flint, and trees exhibiting in their silicified or calcified stems all the details of their microscopic structure—the cells, spiral vessels, or disc-bearing tissue, as well as the medullary rays and rings of growth.

FOSSIL FERNS. As far as has been yet determined from the rocky tablets of the earth's crust, ferns first appeared in the Devonian period, but then only sparingly, not more than nine or ten species having been observed. In the immediately succeeding Coal-measures, they suddenly reached their maximum development. The dense forests and the moist atmosphere of this period were so suited to their growth that they formed a large bulk of the vegetation. Upwards of 350 species have been described, some of them tree ferns of a size fitting them to be the companions of the immense Sigillarias and Lepidodendrons whose remains are found associated with theirs in the Carboniferous rocks. Twenty-three species have been found in Permian strata. Many new forms appear in the Trias, and their number is increased in the Oolite. The fresh-water beds of this period contain numerous beautiful ferns, upwards of fifty species having been described. The marine beds of the Cretaceous

contain very few forms, and in the Tertiary hey are equally rare.

SILIFEROUS ROCKS are those which i organic remains. If we except the lowest orphic rocks, in which, as yet, no fossils een found, the term is equivalent to the lled rocks,' when used comprehensively; but also be applied to a particular bed, as when ak of an unfossiliferous sandstone compared he neighbouring fossiliferous shale or lime-

SOMBRO'NÉ, a small episcopal town of in the province of Urbino and Pesaro, is tly situated on a hill on the left bank of the o—which is here spanned by a fine modern —11 miles east of the town of Urbino. It the 14th c., from the ruins of *Forum Sem-* destroyed by the Goths and Lombards. Some ing Roman inscriptions and remains of the city are contained in the cathedral of St ando. F. is celebrated for its fine manufac- f carpets and woollen cloths, and particularly excellent silk of its neighbourhood. Three rom F. is Il Monte d'Asdrubale, famous as ne of the engagement in which the Cartha- general was defeated and killed by the s in 207 B.C.—See Lauro Jacomo, *Historia a di Fossombrone.*

TER, JOHN, a well-known English essayist, rn in the parish of Halifax, Yorkshire, Sep- 17, 1770. He was educated for the ministry Baptist College at Bristol, but after preach- several years to various small congregations ry indifferent success, he resolved to devote mainly to literature. His *Essays, in a of Letters*, were published in 1805, while he ficiating as pastor of a Baptist chapel at in Somersetshire. They were only four in —On a Man's Writing Memoirs of Himself; cision of Character; On the Application of thet Romantic; and On some of the Causes h Evangelical Religion has been rendered eptable to Persons of Cultivated Taste; yet nes Mackintosh did not hesitate to affirm ey shewed their author to be 'one of the rofound and eloquent writers that England duced.' They have been remarkably popu- ecially among the more thoughtful of the nity, and have gone through upwards of editions. In 1808, F. married the lady to his essays were originally addressed, and to Bourton-on-the-Water, in Gloucestershire, he lived a quiet, studious, literary life, ng, however, in the villages round about on s. In 1819 appeared his celebrated *Essay Evils of Popular Ignorance*, in which he he necessity of a national system of edu- He was long the principal writer in the *Review*, and a selection from his contribu- that magazine was published by Dr Price in He died at Stapelton, near Bristol, October 1. F. was a man of deep but sombre piety. dows that overhung his soul were, however, f an inborn melancholy, and had nothing non with the repulsive gloom of bigotry or sm. His thinking is rugged, massive, and ; and at times, when his great imagination itself from sleep, a splendour of illustration over his pages that startles the reader both beauty and its suggestiveness. Besides the already mentioned, F. published several of which the most important is an *Intro- Essay to Doddridge's Rise and Progress ion* (1825). Compare the *Life and Corres- e of F.* (2 vols. 1846), edited by J. E. Ryland, and republished in Bohn's Standard Library in 1852.

FOTHERGILL PROCESS. This is one of the numerous dry processes in Photography (q. v.) which have for their object the preservation of sensitive plates ready for exposure. It is named after the inventor, and consists in the partial removal of the free nitrate of silver which adheres to the collodion film on withdrawing it from the sensitising bath by washing with water, and the subsequent conversion of the remaining free nitrate of silver into albuminate and chloride of silver by pouring over the plate dilute albumen, containing chloride of ammonium, the excess of albumen being finally washed off by violent agitation with a copious supply of water. The plates being set aside to drain on folds of blotting-paper, are, when dry, ready for use. For details of manipulation, see Hardwich's *Photographic Chemistry.*

FOUCHÉ, JOSEPH, Duke of Otranto, the son of a sea-captain, was born at Nantes, 29th May 1763, and educated at the Oratoire. He hailed the Revolution with enthusiasm, and in 1792 became a member of the National Convention. He voted for the death of Louis XVI., and was one of the commissioners of the Committee of Public Safety sent to Lyon in 1794 to reduce that city to obedience. In 1795, he was expelled from the Convention as a dangerous Terrorist, and kept in confinement for a short time. After the revolution of the 18th Brumaire (5th November 1799), in which he took a part, F., as minister of police (an office to which he had been appointed on the 31st July of the same year), organised an extraordinary police. He restrained the new government from deeds of violence, and by his advice the list of *émigrés* was closed, a general amnesty proclaimed, and the principle of moderation and conciliation steadily adhered to. His remark upon the execution of the Duke d'Enghien was very happy: '*C'est bien pis qu'un crime, c'est une faute*' (It is much worse than a crime; it is a *blunder*). In July 1804, he was again placed at the head of the police. His chief endeavours were directed, as before, to attaching the royalists to the imperial throne by prudent moderation. In 1809, the Emperor conferred on him the title of Duke of Otranto, along with large grants from the revenues of the Neapolitan territory. An unguarded expression, however, in a proclamation, lost him the favour of Napoleon, and in the following year he was forced to resign. In the campaign of 1813, the Emperor summoned F. to head-quarters at Dresden, and sent him thence as governor of the Illyrian provinces, and, after the battle of Leipsic, to Rome and Naples, in order to keep a watch upon Murat's proceedings. Being recalled to Paris in the spring of 1814, he predicted the downfall of Napoleon even before his arrival in France. After the Emperor's abdication, F. advised him to abandon Europe altogether. On his return from Elba, Napoleon again nominated him minister of police; but after the battle of Waterloo, F. placed himself at the head of the provisional government, brought about the capitulation of Paris, drew back the army behind the Loire, and thereby prevented unnecessary bloodshed. At the Restoration, Louis XVIII. reappointed him minister of police; but he resigned his office in a few months, and went as ambassador to Dresden. The law of the 12th January 1816, banishing all those who had voted for the death of Louis XVI., was extended to F. also, who from that time resided in different parts of Austria. He died at Trieste, 26th December 1820, leaving an immense fortune. Napoleon, at St Helena, called F. 'a miscreant of all colours;' and Bourrienne

declares that he 'never regarded a benefit in any other light than as a means of injuring his benefactor'—statements which are far too exaggerated to be worth much. The simple truth appears to be, that F. was a man whose highest principle was self-interest, but whose sagacity was not less conspicuous, and who never failed to give the governments which he served the soundest political advice. It is true, however, that he was unscrupulous in passing from one party to another, and that he was as destitute of political morality as Napoleon himself. In 1824, appeared a work entitled *Mémoires de Fouché, Duc d'Otrante*, edited by A. Beauchamp, which, though declared to be spurious by the sons of F., is generally held to have been based on genuine documents.

FOUGERES, a handsome town of France, in the department of Ille-et-Vilaine, stands on a hill on the right bank of the Couesnon, 28 miles north-east of Rennes. It is a well-built town, with wide streets, and in the old quarter retains traces of the middle ages in the ancient arcades which still obtrude in some places upon the streets. The castle of F. is picturesque, but being commanded by other parts of the town, forms but a feeble defence. In the neighbourhood is a great forest containing Druidical remains. A famous engagement took place here between the Vendean royalists and the Republicans, November 15, 1793. F. has manufactures of sail-cloth, canvas, tape, flannel, lace, hats, &c.; and dyeworks, principally for the dyeing of scarlet. In the vicinity are important glass and paper works. Pop. 9344.

FOULA, a solitary isle in the Atlantic, 25 miles west of the Mainland of Shetland. It is 3 by 1½ miles in extent, and consists of five hills (highest, 1300 feet), rising steeply out of the water. The sea-cliffs are sublime, and covered with sea-birds. The isle is seen from Orkney in fine weather, and is supposed to be the Ultima Thule of the ancients. It has only one landing-place. It is inhabited by about 250 fishermen. F. consists of sandstone, with a small patch of granite, gneiss, mica-slate and clay-slate in the north-east corner.

FOULD, Achille, was born in Paris on the 31st of October 1800, and was educated at the Lycée Charlemagne, one of the most celebrated establishments of Paris. He originally belonged to the Jewish creed, his family being wealthy Jew bankers, but now adheres to the Protestant faith. Early in life, he was initiated into financial transactions by his father, and his natural talents were developed by travel in Europe and the East. In 1842, he began his political career, being then chosen as a member of the council-general of the Hautes Pyrénées, and immediately after elected a deputy for Tarbes, the chief town of that department. He soon acquired a high position in the Chamber of Deputies for the peculiar talent with which he handled questions of finance and political economy. In 1844, he was appointed reporter to the commission on stamps on newspapers, and his views were adopted, in spite of the opposition party, he being at that period a stanch supporter of M. Guizot's home and foreign policy. After the revolution of 1848, F. accepted the new régime of the republic, and offered his services to the provisional government. In July 1848, he was elected representative for the department of the Seine, and continued to rise in public estimation by the elevated views he expressed in the chamber, while opposing among other things a proposed issue of assignats. During the presidency of Louis Napoleon, F. was four times Minister of Finance, and his repeated resignations for state reasons did not prevent him from being again appointe occasion of the *coup d'état*, 2d December 1 once more resigned his position on the 25th following, in consequence of the decree the confiscation of the property of the family. The same day, however, he was senator, and shortly afterwards returned to minister of state. In this capacity, he supe the Universal Paris Exhibition in 1855, pletion of the palace of the Louvre, and o measures. He remained one of the most co ministers of Napoleon III. till December 1 he was succeeded as minister of state b Walewsky. He was out of office up to November 1861, at which date he was re finance minister, his long experience and w ability as a financier pointing him out as to manage the crisis of the French financ time.

FOULIS, Robert and Andrew, two printers of Glasgow, brothers, whose n usually classed together.—Robert, the elde that city, April 20, 1707, was bred, and, l Ramsay, for some time practised as a b those days of flowing periwigs, a profit respectable profession. Having attended f years the lectures of the celebrated Dr Hutcheson, then Professor of Moral Phil Glasgow University, he was advised by th man to become a bookseller. In winte his brother Andrew (born November employed themselves in teaching language summer, they made short excursions to t nent, and thereby acquired a considerabl of learning and knowledge of the world. seems to have been designed for the ch 1727, he entered as a student at the uni Glasgow, where he is supposed to have un regular course of study. About the end Robert began business in Glasgow as a p first publications being chiefly of a religiou In 1742, he published an elegant edition *Demetrius Phalereus on Elocution*, suppos the first Greek work printed in Glasgow. he was appointed printer to the unive 1744, he brought out his celebrated in edition of Horace, 12mo, each printed which was hung up in the college of Glas a reward offered for the discovery of curacy. Soon after, he took his brother An partnership; and for thirty years they to bring out some of the finest specimens and elegant printing, particularly in t and Greek classics, which the 18th c. either in this country or on the continent. them were Cicero's works, in 20 volumes Commentaries, folio; Homer's works, Herodotus, 9 vols., &c.; also an editio Greek Testament; Gray's poems; Pope' a folio edition of Milton, and other pu in English. With the view of promo cultivation of the fine arts in Scotlan Foulis, after a two years' visit to the co preparation, commenced, in 1753, an ac Glasgow, for the instruction of youth in and sculpture. The great expense atten institution led to the decline of the business, which, however, continued to be till the death of Andrew, September 18, 1776, Robert exhibited and sold at Chris Mall, London, the remainder of his paintin after all expenses were defrayed, the bala favour amounted only to fifteen shilli died the same year at Edinburgh, on his Scotland. He was twice married, and le children. One of them was a printer in G

1806. His Virgil, printed in 1778, and his lus, 1795, for beauty and exactness, were not hy of the name of Foulis.

NDATION. This term may be applied to the surface or bed on which a building r to the lower part of the building which n the natural bed. 1. Foundation as the The best that can be had is solid rock, or any resisting incompressible stratum, free from Where there is no chance of water, sand a solid foundation. When the soil is soft, nd shifting, a solid bearing can be obtained driving *piles* or long beams of wood, sharpt the end, through the soft soil, till they hard bottom. This is then planked or laid ross-beams, on which the superstructure is The piers of many bridges are formed in anner. Where the soil is soft, but not , as in the case of made or deposited earth, thod of *Concreting* (q. v.) is adopted—i. e., a urface is laid with broken metal or gravel, n together with hot lime, so as to form a solid artificial rock, on which the building st. 2. Foundation as the base of the building. broader and larger the lower courses of the work, the stronger the wall. The stones if possible, extend through and through, and on each side of the wall.

ie best periods of art, the foundations have been most attentively considered. The formed solid bearings of concrete as above ed, and paid great attention to secure the y of their buildings. In the dark ages, when as want of knowledge combined with want erials and means, many buildings fell from lding of the foundations. Some of the Gothic buildings also suffered from the same But knowledge came with experience, and ndations of the later Gothic buildings, during h and 15th centuries, were built with extreme id on the virgin soil—the stones being as dressed as those above ground, where neces- resist a strong thrust. And where the is thrown unequally on piers and walls, detached joints are all carefully united he floor with a net-work of solid walls. foundations have been the cause of the ruin y modern buildings. This has arisen from itly nature of making a good foundation, he soil is not naturally suitable. But it that no expense should be spared to make ndation good, as the value and stability of erstructure depend entirely on the security oundation.

NDER, also called LAMINITIS, consists of nation of the vascular sensitive laminæ of the foot. It is rarely met with in cattle or wing to the corresponding structures being greatly less developed. Occasionally, the are strained from severe exertion; more tly, they suffer from the morbid effects of hich is especially injurious after the excited exhaustion of labour. Very commonly ey become inflamed from their close sympathy eases of the digestive organs, often following ment of the stomach, or inflammation of rels. All four feet are sometimes affected, sually the fore ones only. They are hot der; the animal stands as much as possible s heels; trembles and groans when moved; n a state of acute fever and pain. Except llowing superpurgation or internal disease, is useful. The shoes must at once be , and the toes, if long, reduced, but no rasping or cutting is permissible. The feet must be enveloped in hot bran poultices, and kept off the hard ground by a plentiful supply of short litter. Soap and water clysters, repeated if necessary every hour, usually suffice to open the bowels, which are very irritable, and physic, if required, must therefore be used with extreme caution. Two drachms of aloes is an ample dose in founder. Have the strain taken off the inflamed laminæ by getting the animal, if possible, to lie down, or, where this is impracticable, by slinging him. When the inflammation continues so long that serum and lymph are poured out between the sensitive and horny laminæ, they must have free exit provided, by making an opening through the toe with a small drawing-knife. This may prevent the *pumiced* and disfigured feet that are apt to follow severe and repeated attacks. After the acute symptoms pass, cold applications to the feet, and a mild blister round the coronet, help to restore the parts to their natural condition.

FOUNDING, or METAL-CASTING, is the art of obtaining casts of any desired object by means of pouring melted metal into moulds prepared for the purpose. It has risen to great importance in recent times, on account of the many new applications of iron. Iron-founding, brass-founding, type-founding, as well as casting in bronze and zinc, are the principal divisions of the art. The casting of the finer metals and alloys, as gold, silver, and German silver, is necessarily conducted on a smaller scale.

When the casting of an object is required, it is necessary, in the first place, to make a pattern. Suppose it to be a plain round iron pillar, such as is used for hanging a gate upon. A pattern of this is turned in some wood which can be readily made smooth on the surface, such as pine, and then varnished or painted so as to come freely out of the mould. This wooden pillar, or any similar pattern, is always made in at least two pieces, the division being lengthwise, for a reason which we shall presently see. The next step is to prepare the mould. The moulds used by the iron-founder are either of sand or loam, but more generally of fine sand. Proceeding with the preparation of the mould, the founder takes a moulding-box, which is composed of two open iron frames with cross-bars, the one fitting exactly on the other, by means of pins in the upper, dropping into holes in the lower frame. One-half of the box is first filled with damp sand, and the pattern laid upon it, a little dry *parting sand* being sprinkled on the surface. The upper half of the box is then put on, and sand firmly rammed all round the pattern. The box is then carefully opened, and, when the pattern is removed, its impression is left in the sand. The mould at this stage, however, is generally rough and broken. It is necessary, therefore, to give it a better finish, which is done by taking each half of the mould separately, repairing it with a small trowel, and re-introducing the corresponding half of the pattern till the impression is firm and perfect. Finally, the surface of the mould is coated with charcoal-dust, which gives a smooth surface to the future casting. These columns being made hollow, there is yet another matter to arrange before the casting can be made—namely, the *core*. In the instance before us, it would simply be a rod of iron, covered with straw and loam to whatever thickness the internal diameter of the column happened to require. The core of course occupies the centre of the mould.

The cast iron is melted with coke in a round fire-brick furnace, called a *cupola*, the heat being urged by means of a powerful blast, created by fanners revolving at a high speed. The molten metal is run from a tap at the bottom of the furnace into a malleable iron ladle, lined with clay, from which it

is poured into the mould through holes called *runners* or *gates*. When the mould is newly filled, numerous jets of blue flame issue from as many small holes pierced in the sand. These perforations are necessary for the escape of air and other gases produced by the action of the hot metal on the mould. Care must also be taken not to have the mould too damp, otherwise steam is generated, which may cause holes in the casting, and even force part of the metal out of the mould. The casting remains covered up for a time, in order to cool slowly, and is then removed by breaking away the sand, and drawing out the core.

In the case of a fluted, or otherwise ornamented pillar, the pattern would require to be in at least four pieces instead of two, because it is only a plain pattern that will come out of the mould in halves without tearing away the sand. When a pattern is necessarily made in several pieces, it is drawn out of the mould bit by bit, to the right or left, as the case may be, and so parts from the sand without breaking it.

Suppose that a small ornamental vase was to surmount the pillar, the founder would prepare the pattern of this in a more elaborate manner. He would first mould it in wax or clay, from which a cast in plaster of Paris is made; from that, again, a cast is taken in an alloy of tin and lead, which, after being sharply chased, and divided into the required number of pieces, is used as a pattern to cast from. All ornamental patterns, such as figures, scrolls, leaves, enriched mouldings, and the like, are made in this way, whatever metal the ultimate casting is to be produced in.

Very large engine cylinders, pans, and such vessels, are cast in loam-moulds, which are built of brick, plastered with loam, then coated with coal-dust, and finally dried by means of a fire. This method is adopted with large plain objects, where a pattern would be expensive, and when few castings of one kind are required.

Iron moulds, coated with blacklead or plumbago, have recently been introduced for casting pipes into; they are greatly more expensive than any other kind, but they enable the founder to dispense with a pattern, as, when once made into the required form, they are not destroyed like moulds of sand or loam at each casting.

Bronze and brass are cast in moulds prepared with finer sand than that used for iron. Pewter and similar soft metallic alloys are cast in brass moulds. The type-founder, on the other hand, uses moulds of steel, which are now worked to a great extent by a machine.

The variety of articles produced by founding or casting are very numerous, among others we may mention cylinders, cisterns, paper-engines, beams, boilers, pumps, and the heavy parts of machinery generally, gates, railings, lamps, grates, fenders, cooking-vessels, and the like, in iron: cannon, many portions of machinery, and numerous ornamental objects, in brass: sculpture and other works of art in bronze and the more costly metals. One of the most remarkable castings yet executed for the requirements of modern engineering, was the cylinder of the hydraulic press used for raising the tubes of the Britannia Bridge. It measured 9 feet × 3 feet 6 inches, the metal being 10 inches thick, and weighed upwards of twenty tons. It remained red hot for three days, and it was seven days more before men could approach it to remove the sand. Sole plates for steam-hammers, and for other purposes, have been cast more than double this weight, but the same care was not required in their execution. In regard to sculpture, perhaps the most wonderful casting known is the colossal statue of Bavaria at Munich, finished in 1850, which stands 54 feet high, the face being equal to the height of a man. It took eight years to cast, and the cost of the bronze used was about £10,000.

FOUNDLING HOSPITALS, establishments in which children that have been abandoned by their parents and found by others, are nurtured at the public expense. Amongst the ancient nations, these institutions were not unknown, though as the law usually placed the power of life and death in the hands of the father, and permitted him to sell his children into slavery, it is to be feared that infanticide, as among eastern nations at the present day, was the usual mode of solving the difficulty which foundling hospitals are intended to meet. Desertion, however, and exposure as less atrocious, were still more frequent crimes; and to meet these, the reception and education of foundlings were enjoined on private persons, to whom they were assigned in property. When this means of support failed, they were protected by the state. The Egyptians and Thebans are praised by the classical historians for discouraging the exposure of infants. The practice of exposing infants probably prevailed even amongst the Germanic nations previous to the introduction of Christianity; and though Tacitus says that infanticide was forbidden, in Iceland, in particular, it is said to have reached a fearful height. From the period at which Christianity became the state religion of the Roman empire, a sensible change in the spirit of legislation on the subjects both of infanticide and exposure is apparent; and though the latter is spoken of by Gibbon as one of the most stubborn remnants of heathendom, it gradually gave way, and the Christian church, at a very early period, lent its encouragement to the establishment of foundling hospitals. So early as the 6th c., a species of foundling hospital is said to have existed at Treves. The bishop permitted the children to be deposited in a marble basin which stood before the cathedral, and gave them in charge to members of the church. But the first well-authenticated one is that of Milan, established in 787, probably in obedience to the 70th article of the Council of Nice, which enjoined that a house should be established in each town for the reception of children abandoned by their parents. It is probable, however, that foundling hospitals existed pretty extensively at an earlier period, as mention is made of them in the capitularies of the Frankish kings. In 1070, a foundling hospital was established in Montpellier; in 1200, in Eimbeck; in 1212, in Rome; in Florence, in 1317; in Nürnberg, in 1331; in Paris in 1362; in Vienna, in 1380. In France, the utility of these establishments, which were the special labour of Vincent de Paul (q. v.), was early called in question; and letters-patent of Charles VII., in 1445, affirmed that 'many persons would make less difficulty in abandoning themselves to sin when they saw that they were not to have the charge of the upbringing of their infants.' In Germany, the system of foundling hospitals was soon abandoned, the duty of rearing the children being, as in England, imposed by law, first on the parents, then on more distant relatives, whom failing, on the parish, and last of all, on the state. The reproach made by Roman Catholic countries against this more natural arrangement—that it tends to promote infanticide—is said to have been in no degree established by statistical investigations. The revolutionary government of France not only adopted the system of foundling hospitals, as it had been handed down to it, but in 1790 declared all children found to be children of the state (*enfants de la patrie*). May, as a still further premium on immorality, it declared

ery girl who should declare her pregnancy receive a premium of 120 francs! The l government, in 1811, abolished this insane nt, continuing, however, the arrangement by he foundling hospitals had become govern- stablishments, and the children, children of e. The system is still adhered to in France, oundling hospitals exist in most of the large to the number of about 141; in Spain, the number is estimated at 70; and gener- he Roman Catholic countries of Europe; and are brought forward to prove that it has ibited what would seem to be its obvious y. The number of children deposited in olving cradle at the Hospital in Paris, in f increasing, is said by the advocates of tem to have diminished in proportion to the ion; but the statement is utterly denied man and Protestant writers. The expense ing a child to the age of twelve in the l at Paris is 952 francs 42 centimes, or a s than £40. The moment that the child is l it is weighed, and if its weight be less than nds, it is considered that its chance to live is all. It is then inscribed in a register, and a statement is drawn up of any name which re been given along with it, or of any par- mark which it bears either on its person or se; of the hour at which it was deposited, and its dress. It is then inspected by a man, and handed over to the nurses. At ch child is committed to a special nurse, f whom are retained on the premises, and centimes a day. Other nurses are brought in e country in carriages kept by the Hospital, eturn conveying the children along with w mothers. The children thus boarded out ected twice a year by local medical men d for the purpose; but the surveillance is a negligent, and consequently the treatment hildren by no means such as to conduce to alth. The parents, and indeed the relations hildren, are permitted to reclaim them at od, or they may be legally adopted by any citizen who is in a condition to maintain Notwithstanding the precautions of which writers boast, the mortality amongst these of the state' is very appalling. Their life, it is said, does not exceed four years; ent. dying during the first year, and 78 per ring the first twelve years. Only 22 out foundlings thus reach the age of twelve, in the general population 50 out of 100 twenty-one. As might naturally be sup- hose who do survive, and are ushered into ld without friends or means, constitute a roportion of the thieves and prostitutes of ntry. Of the male convicts and prisoners ce, 13 per cent. are foundlings, and female gs form one-fifth of the inmates of the houses of prostitution. The question of riety of encouraging secrecy by the use of sing-box, or of causing the parents openly sit the children in the hands of an officer, n, and is still discussed with much keenness ce. The argument in favour of the turning- that by which the whole institution is d, viz., that it tends to discourage infanticide, tistics are said to be rather in favour of it point of view. But there are many other considerations of morality and public policy aken into account, which would serve to balance this advantage, even supposing it to

Many Protestant states have established g hospitals; that at Amsterdam, where 000 children are received annually, is one of the most famous in Europe. The foundling hospitals of Moscow and St Petersburg are among the largest in the world.

The Foundling Hospital in London was established by Captain Thomas Coram, a benevolent sailor, in 1739, as 'an hospital for exposed and deserted children.' The ground in Guildford Street was purchased from the Earl of Salisbury for £7000, and the architect of the hospital was Theodore Jacobson. The system of foundling hospitals never having been approved in England, the London hospital was changed in 1760 to what it now is—viz., an hospital for poor illegitimate children whose mothers are known. The committee, previous to admitting the child, must be satisfied of the previous good character and present necessity of the mother. The qualification for a governor is a donation of £50. The great Handel was one of the chief benefactors of the hospital. He endowed it with a magnificent organ, and frequently performed his oratorio of the *Messiah* in the chapel, which is still celebrated for its music. Though every attention is paid to the health and comfort of the children at the Foundling—to such an extent, indeed, as very often to unfit them for the hardships which many of them must encounter in after-life—we have been informed by the physician that they do not attain to the height of average English men and women. There are no foundling hospitals in the United States; but they exist in Mexico, and in almost all the states of South America.

FOUNTAIN, a basin or jet for the supply of fresh running water. There are fountains of every form and variety, from the simple spring with its natural basin, to the most elaborate and ornamental structure for the display or supply of water. In all ages, fountains have been considered as public monuments of the greatest importance; and where the source for their supply has not been provided by nature on the spot, immense labour and expenditure have often been incurred to make up for the deficiency. The splendid Aqueducts (q. v.) of the Romans are instances of the important light in which they regarded the fountains of their cities. Every Roman town had at least one aqueduct, the water from which was distributed to as many fountains as the population required.

Utility is the first object of a fountain, and although they are frequently made subjects of great display and magnificence, the finest fountains are those where the water is the greatest ornament. In the middle ages, fountains of great beauty and variety of form were built, but the useful nature of the structure was never lost sight of. Sometimes a spring was arched over for protection, with a beautiful vault, and a statue of the patron saint placed in a niche, with a basin below to contain the water. In towns where a number of persons might require to draw at one time, a large basin was erected, with a pillar in the centre, from which pipes radiated all round -each with its separate jet to supply the running water—while the basin was used for washing the pitchers. Many examples of this kind of fountain remain. On the following page is represented a fountain at Viterbo, in the Papal States, where there are many of the same description. The pillar is sometimes surmounted by a statue, or has one or more smaller basins, with ornamental streams and jets of water falling from tier to tier. A beautiful fountain of this nature existed in the royal palace at Linlithgow, and a copy of it has recently been erected in front of Holyrood Palace.

In modern times, the French have distinguished themselves by their magnificent fountains, those of Paris and Versailles being almost unrivalled. In

England, the fountains at Chatsworth (q. v.) and those at the Crystal Palace are among the finest, and are remarkable for the great height to which

Fontana Grande, Viterbo.

the water is thrown. Although Rome has lost four-fifths of the aqueducts which so lavishly supplied her with fresh water in the times of the Empire, she is still unsurpassed for the number, beauty, and utility of the public fountains which adorn her streets and places.

Modern fountains are, for the most part, entirely ornamental. This arises from the modern mode of distributing water in pipes through the houses, making the street-fountains to a great extent useless. It is found, however, that our town populations—both man and beast—require some public supplies of water, and these are now largely supplied by the numerous drinking-fountains which are being constructed in all our principal towns.

FOUNTAIN. Water is represented heraldically by a round ball, having wavy stripes of blue and white, barways, called a fountain.

FOUQUÉ, FRIEDRICH HEINRICH KARL, BARON DE LA MOTTE, a modern German author, was grandson of the Prussian general of this name, distinguished in the Seven Years' War. Born at Brandenburg, 12th February 1777, F. served as Prussian officer in the campaigns of 1792 and 1813. The interval between these campaigns was devoted to literary pursuits in the country, and the rest of his life was spent alternately in Paris and on his estate at Nennhausen, and subsequently at Halle. He died in Berlin, 23d January 1843. F. appeared first under the name Pellegrin, as translator of Cervantes's *Numancia*, and author of some effusions in the spirit of Spanish poetry. But the Norse legends and old German poetry attracted him most strongly; this was evinced in numerous romances, in prose and verse, which picture the old life of medieval Europe. Among the best known of these are *Sigurd, der Schlangentödter* (1809)—the first work to which F. attached his real name—*Der Zauberring, Die Fahrten Thiodolf's*, and *Undine*. Successful in exhibiting many of the beauties of the romantic school, he is yet chargeable with all its extravagances. Straining too often after fantastically unnatural conceits, he seems fascinated by the antique life which he pictures, rather merely from its quaint contrast with modern manners, than as a form into which the life of actually living men had shaped itself in former times. He has himself edited a selecti works (*Auserwählte Werke*, 12 Bde., Halle F.'s first wife, KAROLINE VON BRIEST, is al in Germany as a productive authoress.

FOUQUIER-TINVILLE, ANTOINE the notorious public accuser in the Frenc tion, was born in the village of Hérouell department of Aisne, in 1747. His early c immoral, but insignificant. On the outbre Revolution, he figured as one of the fierc crats. By Robespierre, he was appointe member, then director and public accus Revolutionary Tribunal. Without educa science, or sense of justice, he executed w apathy the bloody orders of the Com Public Safety. In reference to this featu character, his countrymen say that 'he ha —not even that of a tiger, which at least to be pleased with what it devours.' Inc friendship, or of anything even remot to generosity, he systematically aband successive coadjutors in their hour of sent to the scaffold, without the slight punction, Bailly and Vergniaud, Danton an Robespierre and St Just. He himself di guillotine, in a cowardly manner, 7th May

His most famous work is the *Théorie*

Théorie (Par. 1822), in which he applies new
ls of mathematical investigation. An allied
; is discussed in his *Mémoire sur les Tempera-
'u Globe Terrestre et des Espaces Planétaires*
1827). Besides heat, he occupied himself
ie theory of equations, which received from
portant improvements. His work, *Analyse
uations Déterminées*, distinguished both for
stance and manner of exposition, was left
ied, and was published after his death by
(Par. 1831).

RIER, François Marie Charles, a French
t, was born at Besançon, April 7, 1772. His
a merchant, had him educated in an
y at Besançon for his own profession. He
nished himself by his perseverance and
in study, and excelled in geography, mathe-
music, and the natural sciences. He left
lies with regret to enter upon the duties of a
nt's clerk, which he performed with zeal and
y at Lyon, Rouen, Marseille, and Bordeaux.
travelled in the interest of his employers,
y in France, but in Holland and Germany.
ie journeys and residences, nothing escaped
servation; he noted climate, culture, popu-
public and private edifices, and remembered
ie topography of villages, and the dimensions
lings, with astonishing accuracy. His father
1781, leaving him about £5000, which he
possessed of in 1793, and invested in trade
n. This was lost in the Revolution; and he
rown into prison, and compelled to serve two
s a cavalry soldier. Discharged on account
ss, he obtained employment in a mercantile
at Marseille, where he was employed to
tend the destruction of an immense quantity
, held for higher prices, in the midst of a
of food, until it had become unfit for con-
on. This circumstance called his attention
frauds and duplicities of commerce, and he
l his spare time to the study of social prob-
ntil he developed the system of Socialism
ch his name is commonly given. This
is contained in several works, written and
ed under discouraging circumstances. In
e published his *Théorie des Quatre Mouve-
et des Destinées Générales* (Theory of the
lovements, and of the General Destinies of
man Race). In 1822, he produced his *Traité
iation Domestique Agricole* (Treatise on
ic and Agricultural Association); in 1829,
veau Monde Industriel et Sociétaire (The
dustrial and Social World); in 1831, *Pièges
fatuisme des Deux Sectes Saint-Simon et
promettant l'Association et Progrès* (Snares
ackeries of the Two Sects of St Simonians
wenites, promising Association and Pro-
in 1835, *La Fausse Industrie, Morcelée,
nte, Mensongère, et l'Antidote, l'Industrie
lle, Combinée, Attrayante, Véridique, donnant
ple Produit* (False Industry, Fragmentary,
ve, and Lying, and the Antidote, a Natural,
ied, Attractive, and Truthful Industry, giving
ple Products). These works, written in the
f commercial pursuits, and published at long
ls, by means of his small savings, found few
ears few readers, and no disciples. Towards
se of his life, a small group of intellectual
cepted his views, and gathered round him,
n the details of his social system from his
ps. He was unwearied in his efforts to
men of power or capital, who could give
ories the test of practical realisation, and for
f the last years of his life waited patiently at
n hour every day, expecti g to be visited by
patron. His less patient disciples probably
hastened his death by immature and partial efforts
at realisation. He died in Paris, October 8, 1837.

FOURIERISM, the Social System invented by Charles Fourier, is contained in his published works, in a large collection of unpublished MSS., and in the writings of Considerant, Lechevallier, Brisbane, and others of his disciples. It differs materially from the systems of Communism strictly so called, and all other social theories, and professes to be based upon natural laws, and capable of being carried out on mathematical principles, as fixed and certain as those of geometry, music, or colours. The earth and human society, Fourier taught, are in their crude and infantile stage. The period of the race will be 80,000 years, the latter portion of which will be its declining phase, as the present is its ascending. The middle term will be a long period of maturity, prosperity, and happiness. What we call civilisation, Fourier considers a false and imperfect condition, with poverty, crime, ignorance, idleness, repugnant toil, disease, wasting wars, general antagonism, oppression, and misery. He believed that Association would produce general riches, honesty, attractive and varied industry, health, peace, and universal happiness. Considering attractions and repulsions the governing forces of all nature, and that God has distributed them for the happiness of all His creatures, he held that 'attractions are proportional to destinies,' or that the desires or passions of men, their aptitudes and inclinations, if they could have free scope, would infallibly produce the highest condition and greatest happiness of which they are capable. He believed in a universal harmony, flowing from and centering in God, the author of all harmonies, and that there is therefore a principle of 'universal analogy.' Seeing that all things, from suns and planets to atoms, range themselves in groups and series, according to certain fixed laws of attraction and repulsion, he laboured to discover the kind of human society that must eventually form itself in obedience to those laws. This is the Association or Phalanstery, which is to consist of 400 families or 1800 persons, which number he found included the whole circle of human capacities. These should live in one immense edifice, in the centre of a large and highly cultivated domain, and furnished with workshops, studios, and all the appliances of industry and art, as well as all the sources of amusement and pleasure. When the earth is covered with palaces of attractive industry, the associations will also unite in groups and series, under a unitary government. There will be but one language and one government, and the only armies will be the great industrial armies, which will drain swamps, irrigate deserts, plant forests, and effect the amelioration of climates. The system of Fourier does not propose to destroy, but rather to conserve property, position, and hereditary rights, nor does it war directly with morals or religion. The property of the Association is to be held in shares, and the whole product of the industrial and artistic groups is to be divided into twelve parts, of which five parts are due to labour, four to capital, and three to talent. The apartments are to be of various prices, and the styles of living to vary in luxury and cost; but the poorest person in the Association is not only to be secure of comfort, but his minimum of enjoyments will be greater than the present social arrangements can give to princes and millionaires; while these will have opened to them pleasures of which they can now scarcely have a conception. The economics of the large scale in the Phalanstery reduce by two-thirds the expenses of living, while an attractive and scientific industry would quadruple the products of civilisation.

The passions of the human soul to which the system of Fourier would give full scope, he described as the five sensitive—sight, hearing, taste, smell, touch; four affective—friendship, love, ambition, and paternity; three distributive—the emulative, alternating, and composite. In these he found the springs of industry and true society. Emulation, the desire of success, honours, rewards, is the great stimulant to exertion; alternation of employments makes work a recreation; and the composite passion requires combinations of charm and enjoyment which only Association can give. Many attempts have been made—a few in France, and more in America—to carry the ideas of Fourier into practical realisation; but they have all been on a small scale, and with inadequate means, and have resulted in failure. Whatever we may think of the system, in its principles or its theoretical development, nothing can be founded upon the failure of such experiments. It remains to be proved whether human nature, in its present state, is capable of carrying out successfully a social system so widely varying from all existing social conditions. The moral objections to Fourierism are, that it appears to make luxury, ambition, and sensual delights the end of existence—the incentives and rewards to all exertions; and that the passions of men, when left in the perfect freedom which this system requires, would lead to ruinous demoralisations. The answer is, that 'attractions are proportional to destinies,' and that these excesses belong to the present state, and are incident to the poverty and repressions of civilisation, but could not exist in a true society; which raises the question—What is a true society? Whatever may be thought of the practicability of the system, its study in the works of Fourier is full of suggestions to the student in sociology.

FOURNI ISLANDS (anc. *Corâssiæ* or *Córseae*), a group of about 20 small islands in the Grecian Archipelago, between Nicaria and Samos, on the eastern coast of Asiatic Turkey. The largest of these islets is about five miles in circuit.

FOWEY, or FOY, a borough town on the south coast of Cornwall, on the right bank of the river Fowey, 25 miles south-south-west of Launceston. It is sheltered by hills, and lies amid picturesque scenery, rude sea-cliffs, and promontories. The harbour admits large vessels at all states of the tide, and its entrance is guarded by three forts. The chief business is catching and curing pilchards, which, with 'china-stone' and iron-ore, form the main exports. F. sent 47 ships and 770 men to the siege of Calais by Edward III. in 1347. It was burned by the French in 1457, and taken by Fairfax in 1646. Pop. (1861) 1450.

FOWL (Ger. *vogel*; allied to the Lat. root *fug-*, to flee, and perhaps to *veg-*), a word originally synonymous with *bird*, and still employed in that signification, but also in a much more restricted sense, as the designation of the genus of Birds (*Gallus*) to which the common Domestic Fowl (*G. domesticus*) belongs. This genus gives its name to the important order of *Gallinaceous Birds*, also called, from their well-known habit of scraping the earth in search of food, *Rasores* (Lat. Scrapers); and is included in the family *Phasianidæ*, with pheasants, tragopans, &c. The general form, and the characters of the bill, feet, &c., agree with those of the pheasants; but the crown of the head is generally naked, and furnished with a fleshy *comb*, the base of the lower mandibles also bearing fleshy lobes or *wattles*, characters which are most conspicuous in the males; and the tail is very different from that of the pheasants, and, indeed, very singularly formed, being composed of fourteen feathers in two nearly vertical planes, or as if a horizontal tail were folded together, so as to make a sharp angle at top, the two middle feathers being the uppermost, and in the males elongated beyond the rest, and gracefully arched. The tail-coverts of the male are also very ample, and the feathers of the back of the head and of the neck are either elongated and loosely webbed, forming the *hackles*, so much valued by anglers for dressing artificial flies, or are otherwise modified to serve the purpose of adornment; characters which are also sometimes exhibited in a very inferior degree in the female sex. The legs of the male are armed with spurs, as in the pheasants, of which much use is made in the combats of these birds among themselves, all of them being very pugnacious. They are all polygamous, and unable to endure the presence of a rival. They are all natives of the East Indies and of the Malayan Archipelago. From what country, and at what period the Domestic Fowl was originally introduced into Europe, is uncertain. The remains of Egyptian antiquity carry us back to a period when it was apparently unknown in Egypt, and there is no distinct allusion to it in the Old Testament; but it seems to have been common in the south of Europe from the earliest ages of European civilisation. The cock was sacred to Apollo, to Mercury, to Mars, and to Æsculapius. It was figured on Grecian and Roman coins and gems; it was highly valued for its courage and pugnacity, and the sport of cock-fighting was a favourite one both with the Greeks and the Romans, as it is amongst the Chinese, the Malays, and many other nations at the present day, and in former times was amongst all classes of society even in Britain. See COCK-FIGHTING. The Domestic Fowl appears to have been known to the ancient Britons before the Roman invasion; and when the South Sea Islands were first visited by Europeans, it was found there in the same domesticated state, and there also cock-fighting was found to be a fashionable amusement of the savage natives. The native country of the Domestic Fowl is not certainly known, nor is it certain what the species is in its original state. The ancient Greeks sometimes called it the *Persian Bird*, and hence it has been supposed to be a native of Persia; but there is nothing else to support this opinion, and it seems likely enough that this appellation may at most only indicate its introduction into Greece from Persia. The Jungle Fowl of India, the first species of *Gallus* known in its wild state to naturalists, was for some time supposed to be the origin of the Domestic Fowl, but to this opinion there are strong objections in the very peculiar character of some of the feathers which distinguish the Jungle Fowl, and of which no trace ever appears in the Domestic Fowl. More recently, the Bankiva Fowl and other species have been discovered in Java and other islands of the Eastern Archipelago, more nearly resembling the Domestic Fowl, and the distribution of the latter through the islands of the Pacific Ocean is favourable to the belief that it derived its origin from that region; but still the identification of the species remains difficult, and some naturalists incline to the opinion that the Domestic Fowl may be derived from intermixture of distinct wild races.

The BANKIVA FOWL (*G. Bankiva*), native of Java, is extremely similar to some of the domestic varieties; indeed, Sir William Jardine says: 'Many Bantams so nearly resemble this bird, that there would be great difficulty in making a distinction. The comb is large and lobed, or denteated; the colours are brilliant, steel-blue and chestnut, black and yellowish brown, the hackles abundant and golden orange; some parts of the plumage exhibiting a very fine play of colours. A very similar

scies, or a variety of the same, but rather larger, found in some parts of continental India.' Very nilar also is the BRONZED FOWL (*G. æneus*), found Sumatra, a bird resplendent in metallic green, rple, and lake; but of which the comb has the per margin unbroken; the wattles are combined to one attached to the centre of the throat; d the neck feathers do not assume the *hackle* aracter, which appears in the neighbourhood of e tail alone. These peculiarities also belong to e FORK-TAILED FOWL (*G. furcatus* or *Javanicus*), species very abundant in the jungles of Java, and ten to be seen on their outskirts, nearly two feet length from the tip of the bill to the extremity the tail. A still larger species—if, indeed, these e not rather varieties than species—is the IGANTIC FOWL, JAGO FOWL, or KULM FOWL (*G. giganteus*) of Sumatra, with double wattle under he throat, abundant hackles on the head, neck, and pper part of the back, green and reddish yellow he principal colours, and the height considerably nore than two feet.—The JUNGLE FOWL (*G. Sonneratii*), abundant in the higher wooded districts of India, where it is much sought after by European portsmen, is about equal in size to an ordinary Domestic Fowl, but is more slender and graceful in its form; the comb of the male is large, and its margin broken; the colours are rich and beautiful; ut a remarkable peculiarity is exhibited in the ackle feathers, which are terminated by flat horny lates of a golden orange colour, into which the haft expands, or the shaft thickening and terminating abruptly gives rise to a battledore-like stem nd disc, in substance like the tips of some of the athers of the wax-wing.

Of the Domestic Fowl there are some very curious rieties, of which some naturalists have attempted constitute distinct species, particularly the NEGRO WL (*G. morio*), rarely seen in British poultry-rds, remarkable for the black colour of the *periosteum* (the outer covering of the bones), and the dull rple of the comb, wattles, and skin; the SILKY WL (*G. lanatus*), very common in China and pan, with periosteum and skin of the same dark our as the Negro Fowl, but the flesh remarkably ite, the comb and wattles purple, the feathers th webs disunited and silky; and the FRIESLAND obably a mistake for FRIZZLED) FOWL (*G. crispus*), ich has all the feathers standing nearly at right gles to the body.

There are also varieties of the Domestic Fowl narkable for what may be considered monstrosities—as the want of a tail and of some of the last rtebræ, the presence of an additional spur on each (Dorkings, &c.), superabundant combs, crests or ts of hackle feathers instead of combs, tufts of thers springing from the lower jaw (the SIBERIAN WL), &c.; and there are many varieties esteemed keepers of poultry, of which the most important —1. The GAME FOWL, with erect and slender dy and shewy colours, valued also for the delicacy the flesh and of the eggs, although the eggs are ther small. It is this breed which is used for ck-fighting: and so excessive is the pugnacity ich characterises it, that broods scarcely feathered s occasionally found to have reduced themselves utter blindness by their combats. Some poultry-epers think it good to have a game-cock in their ultry-yard, on account of the improvement of the ality of the fowls sent to the table; but it is most needless to say, he must, like the prototype Robinson Crusoe, be sole monarch of all he rveys. 2. The DORKING FOWL, so named from rking, in Surrey, where it has long been bred great numbers for the London market—a breed aracterised by an additional spur on each leg; often of a white colour, with short legs; one of the most useful of all breeds, both for excellence of flesh and for abundance of eggs. 3. The POLISH FOWL, black, with a white tuft, a breed very extensively reared in France, Egypt, &c., little inclined to incubation, but valued for an almost uninterrupted laying of eggs. 4. The SPANISH FOWL, very similar to the Polish, but larger, and laying larger eggs, on account of which it is now much valued, and very common in Britain; black, with white cheeks and large red comb. 5. The MALAY FOWL, tall and handsome, very pugnacious, but little esteemed. 6. The HAMBURG, of very beautiful plumage, and much valued for the quality both of flesh and eggs, as also for extreme productiveness of eggs. 7. The COCHIN CHINA FOWL, a large, tall, ungraceful variety, with small tail and wings, for which there was a great rage among poultry-fanciers when it was newly introduced into Britain, and particularly about the year 1852, and which is valuable chiefly on account of its fecundity, eggs being laid even during winter, and the hens incubating frequently. 8. The BANTAM FOWL (q. v.), a diminutive variety, rather curious than useful.—Of most of these there are many sub-varieties and *fancy breeds*—gold-pencilled, silver-pencilled, &c. The common DUNGHILL FOWL is apparently a breed produced by the intermixture of others, and perhaps chiefly a less graceful, less spirited, and less pugnacious race of the Game Fowl.

Concerning the treatment of the Domestic Fowl in the poultry-yard, the diseases to which it is liable, &c., see POULTRY. The artificial hatching of eggs is noticed in the article HATCHING. Concerning the eggs of the Domestic Fowl as an article of commerce, &c., see EGG.

The readiness with which the Domestic Fowl can be induced to go on laying eggs far beyond the number proper for a brood, is not nearly equalled in the case of any other domesticated bird, and greatly enhances the usefulness of this species to mankind, whether the eggs are used for food, or, by artificial hatching, made to produce chickens, as is common in Egypt and some other countries. Few hens incubate oftener than once a year, but some lay in the course of a year even more than 200 eggs.

FOWLER'S SOLUTION. See ARSENIC.

FOWLING—the killing or taking of birds for the sake of their flesh, feathers, &c.—is very variously practised in different parts of the world. In some places, it is one of the principal employments of the people, who greatly depend on it for their subsistence, and prosecute it with the greatest toil and danger; elsewhere, it is in some of its forms a recreation, for the sake of which much expense is incurred by the opulent. The modes in which it is practised depend partly on the habits of different kinds of birds, and partly on the progress of civilisation and the arts. The peculiar habits of some birds render it very easy to take or kill them. Nets are much used in the capture of many kinds of birds, particularly of small birds intended for the table: bird-lime is employed for the same purpose, and birds are taken by means of it in greatest numbers near their drinking-places, particularly in hot and dry weather; gins, springes, and traps of various kinds are also employed.

The numerous kinds of ducks, geese, and other *Anatidæ*, are, in an economical point of view, among the most important of birds; and the methods employed for their capture are very various and interesting. These, however, we reserve for a separate article, WILDFOWL; and refraining also here from any notice of the amusements of the

sportsman, we shall proceed to describe the methods adopted in *Rock-fowling*, on which the inhabitants of many northern coasts and islands in a great measure depend for their means of subsistence. Of all kinds of fowling, it is by far the most adventurous. The objects of pursuit are gannets or solan geese, gulls, terns, guillemots, and other sea-birds, which frequent the most lofty precipices, and breed on their shelves and ledges. The flesh, even of the best of them, is generally coarse, and of a fishy taste, yet it forms great part of the food of the poor people, both fresh, and salted for winter provisions. The flesh of the young is more tender and pleasant than that of adult birds. The eggs of some species are sought after by the same perilous means as the birds themselves. The feathers, too, are an article of commerce. The people of St Kilda pay part of their rent in feathers; and the rocks of that island are apportioned among its inhabitants as exactly as its soil. Almost every man in the island is a cragsman or rock-fowler, which is pretty nearly the case also in many other northern isles. The multitudes of sea-fowl around many of the rocky northern coasts is prodigious, resembling at a distance—as may be seen at the Bass Rock in the Firth of Forth—the bees around a busy hive. Uninhabited islets are annually visited by fowlers, as Borrera by the people of St Kilda; and the 'stacks,' or high insular rocks near the shore, are often extremely productive. These are, of course, reached by means of a boat; and whilst landing is often both difficult and dangerous, the climbing of the precipice is still more so. The Norwegian fowlers, or 'bird-men,' carry on such expeditions with a *bird-pole* or *fowling-staff*, about five or six yards long, and a rope of several fathoms. The bird-pole has an iron hook at one end: it has also a flat head; and by means of it the fowler is pushed and guided by his comrades below as he ascends a very steep or precipitous cliff; by means of it, also, he strikes down or draws in birds. The rope is used to fasten two fowlers together, being attached to the waist of each: they aid one another in climbing, pushing, and drawing one another up the rocks, the safety of the one often depending on the strength and courage of the other. The bird-pole is also used with a small net attached to it, in the capture of birds that are flying around. The Norwegian fowlers sometimes remain for days on ledges where birds are abundant, sleeping in holes or clefts, and having food let down to them by a rope from above.

Still more perilous, if possible, is the mode of fowling practised where the precipices cannot be scaled. The fowler is let down by a rope, and hangs in mid-air, often at an elevation of several hundred feet, above rough rocks or roaring waves; and by means of his feet or of a pole, throws himself out to such a distance from the face of the rock as to obtain a view of all its ledges and crannies, to which, with astonishing coolness and dexterity, he directs his course, often also catching the birds that fly near him in the air. Speaking of the fowlers of St Kilda, Wilson (*Voyage Round the Coasts of Scotland and the Isles*) remarks: 'How one man (for such is the case), himself standing with the points of his toes upon the verge of a precipice many hundred feet deep, can, with such secure and unerring strength, sustain the entire weight of another man bounding from point to point below him with irregular and frequent springs, is what a stranger cannot understand. . . . . But we ascertained that there is never more than a single man above supporting the weight of the one below. Each of these couples has two ropes. The rope which the upper man holds in his hands is fastened round the body and beneath the arms of him who descends, while another rope is pressed by the feet of the upper man, and is held in the hand of the lower.' The second rope is for giving signals, and for sending up birds when captured. The principal rope is made of raw cowhide, cut into thongs and twisted; it is so durable as to last for two generations, and is bequeathed as valuable property by father to son. Other materials, however, are used elsewhere; and the practice differs also as to the number of comrades holding the rope above. In the Faroe Isles, where some of the precipices are 1400 feet in height, the rope is usually held by a number of men. In some of the Scottish islands, fowlers have been adventurous enough to descend the cliffs unaided, fastening the rope for themselves to a stake driven into the ground above. The fowlers of the Faroe Isles sometimes use the pole with net at the end, whilst suspended in the air. It is not unusual for the fowler, when he finds a ledge or recess in the precipice abounding in birds, to disengage himself from the rope whilst he pursues his labours there; but when the precipice overhangs above, he is exposed to a great danger of the rope's escaping from his reach. A case is on record in which the only resource of the fowler was to make a desperate spring and catch the rope, which hung a few feet before him in the air; and this he succeeded in doing.

The cut represents rock-fowling at the Holm of Noss, a precipitous insular rock, separated from Noss,

The Holm of Noss, Shetland.

one of the Shetland Isles, by a chasm of 65 feet wide, and 160 feet deep, over which ropes have been stretched, so that a *cradle* or sparred box can be made to pass along them, affording access to the grassy summit of the Holm, where a few sheep now feed, and where innumerable sea-birds make their nests.

FOWLS OF WARREN. Lord Coke says they are 'the partridge, quail, rail, &c.,' 'pheasant, woodcock, &c.,' and the 'mallard, heron, &c.,' leaving the etcæteras without explanation (*Co. Litt.* 233). Manwood, again, lays it down that there are only two fowls of warren, the pheasant and the partridge (Manw. 95). In the Duke of Devonshire *v.* Lodge (7 B. and C. 36), it was decided that grouse are not birds of warren.

, CHARLES JAMES, a celebrated Whig statesas the second son of Henry Fox, first Lord , by Lady Georgiana Carolina, eldest r of the Duke of Richmond. He was born, g to Lord John Russell's memoir, on the nuary 1749 (N.S.), and was educated at Eton ord, spending his vacations on the continent gayest and wittiest circles of the French and visiting Switzerland and Italy. Notding the irregular life which he led even ool-boy, he was very distinguished for ability school and college; and so high was his opinion of his talents, that at the age of he had him brought into parliament as for the borough of Midhurst, a step to e is said to have been further incited by that, even at this early age, F.'s energies nd an outlet in gambling and various other f dissipation. His precocity in vice, as in intellectual development, is said to have e result of the injudicious fondness of his principled but very gifted father. Till he his majority, F. prudently kept silent in the but immediately thereafter he appeared as a r of the administration of Lord North, and arled with the office of one of the lords of iralty. In 1772, he resigned that office, and owing year was named a commissioner of asury. From that post he was dismissed, in ence of a quarrel with Lord North, and ver to the ranks of the opposition. During le course of the American war, he was the midable opponent of the coercive measures vere adopted by the government, and the werful advocate of the claims of the colocting, to this extent at least, in accordance e views which for many years before had ged upon the country by the great Lord a, the father of his future rival Mr Pitt. ference between them was, that whereas atham urged conciliation, in order to pre- connection between the two countries, F. and foretold the necessity and the advancomplete separation. In 1782, on the down- Lord North, F. was appointed one of the ies of state, which office he held till the the Marquis of Rockingham, when he was d by the Earl of Shelburne, afterwards of Lansdowne. On the dissolution of the e administration, the North and Fox coali- formed, and F. resumed his former office; rejection of his India Bill by the House of on after led to the resignation of his govern- It was now that Mr Pitt came into power, the long and famous contest between him , who occupied the position of leader of osition, commenced. In 1788, he enjoyed a spite from his public labours. Accompanied wife, he visited the continent, and having few days at Lausanne, in the company of who was there engaged in writing his history, he set out for Italy. The sudden of the king, however, and the necessity of ting a regency, rendered it undesirable that ld be longer absent from England, and he l back to his post. The regency, the trial en Hastings, the French Revolution, and the which followed it, gave ample scope to the and energies of F., and on all occasions he d his influence to modify, if not to coun- the policy of his great rival. He was a s opponent of the war with France, and cate of those non-intervention views which ater favour in our day than they did in his. e death of Pitt, F. was recalled to office, eavoured to realise his doctrines by setting on foot negotiations for a peace with France, the results of which he did not live to witness. He died on the 13th September 1806, in his 58th year. In private life, Mr F. was a genial companion, kindly and sincere in the closer relations of friendship, whilst his conduct to those to whom he was opposed in public was generous, and free from every trace of malignity or enmity. Lord John Russell, in the preface to his *Memorials and Correspondence*, speaks of the singular candour, boldness, simplicity, and kindness of his character; and of his oratorical powers it is enough to record, that Burke called him 'the greatest debater the world ever saw,' and Sir James Mackintosh, 'the most Demosthenian speaker since Demosthenes.' His remains were interred in Westminster Abbey, so near to those of Pitt, as to suggest to Sir Walter Scott the well-known couplet—

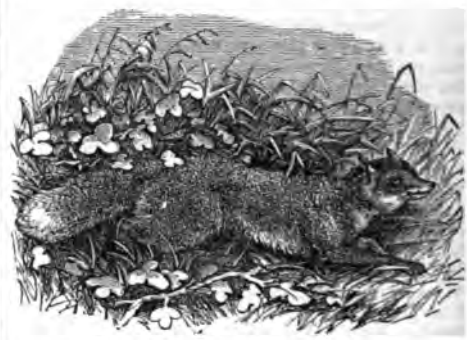
> Shed upon Fox's grave the tear,
> 'Twill trickle to his rival's bier.

FOX, GEORGE, the originator of the Society of Friends (q. v.), commonly called Quakers, was born at Drayton, in Leicestershire, in 1624, and at an early age was employed in keeping sheep. Subsequently, he was apprenticed to a country shoemaker; but when about 19 years of age, his religious impressions produced such a strong conviction in him, that he believed himself to be the subject of a special Divine call; and abandoning his usual avocations, wandered solitarily through the country, dressed merely in a leathern doublet of his own making, and absorbed in spiritual reveries. After some time, his friends induced him to return home, but F. stayed with them only for a short period, and finally adopted the career of an itinerant religious reformer. About 1646, he left off attending church for divine worship, but did not scruple to interrupt the services when conducted by 'professors,' i. e. formalists, or persons whom he believed not to be genuine Christians. His first efforts at proselytism were made at Manchester in 1648. The excitement caused was very great, and, in consequence, F. was imprisoned for some time as a disturber of the peace. It may be proper to mention here, that his leading doctrines or convictions were the futility of learning for the work of the ministry, the presence of Christ in the heart as the 'inner light,' superseding all other lights, and the necessity of trying men's opinions and religions by the Holy Spirit, and not by the Scriptures. F. next travelled through various of the midland counties, Derby, Leicester, and Northampton, exhorting the people in public places to forsake all vicious practices, drunkenness, swearing, &c., and to cultivate the Christian graces. He had a winning manner, resulting from his extreme earnestness and simplicity of purpose, and made many converts. His followers were first contemptuously called 'Quakers' at Derby, in 1650, by Justice Bennet, for what reason is not exactly known, but it may be conjectured that it possibly arose from the agitation exhibited in their speech when they believed themselves 'moved by the Holy Ghost.' In 1655, F. was brought to London, and examined before Cromwell, who quickly saw that there was nothing in Quakerism to excite his apprehensions, and pronounced the doctrines and the character of its founder to be irreproachable. Nevertheless, for some years after this, F. had a hard struggle with his Puritan antagonists. In an age of dogmatism and fanaticism, it was not to be expected that the half-mystical spiritualities and grotesque practical crotchets of the Leicestershire shoemaker could meet with any official toleration. F. was constantly vilified and frequently imprisoned by country magistrates. In 1669, he married the

widow of Judge Fell. He then went to America, where he spent two years in propagating his views with much success. On his return to England in 1673, he was imprisoned for some time in Worcester jail, under the charge of having 'held a meeting from all parts of the nation for terrifying the king's subjects.' On his release, he visited Holland, and afterwards Hamburg, Holstein, and Danzig, always endeavouring to persuade men to listen to the voice of Christ within them. He died in London, January 13, 1691. F. was not a man of broad and philosophic genius; he did not enrich the world with the multitude of his thoughts; in fact, there is a conspicuous poverty of intellect and sentiment manifested in his writings, but (as often happens in the case of a mystic) the earnestness and clearness with which, in the opinion of many, one great truth of Christianity was realised, imparted a power and efficacy to his words that genius itself might envy. His doctrine of the universal 'inner light'—defended in a more learned fashion by Barclay (q. v.) in his *Apology for the Quakers*—may be regarded as a protest against the narrow or at least excessive 'scripturalism' of his age, but his understanding was not sufficiently clear and strong to guide him safely in all the consequences which he ventured to deduce from it. Hence have sprung most of the *niaiseries* of Quakerism. His writings were collected and published in 3 vols., 1694—1706. An edition in 8 vols. has been published at Philadelphia, United States.—Compare Sewel's *History of the Quakers;* Neal's *Puritans;* Marsh's *Life of Fox* (1848); and Janney's *Life of Fox, with Dissertations*, &c. (Phila. 1853).

FOX, William Johnson, orator and political writer, the son of a small Suffolk farmer, who afterwards settled as a weaver at Norwich, was born in 1786. He gave early promise of talent, and was sent to Homerton College, to be trained for the ministry of the Independents. He subsequently seceded to Unitarianism, but ultimately shaking off all allegiance to existing Christian churches, he delivered a series of prelections at his chapel in South Place, Finsbury, which marked him out as the leader and organ of English rationalism. When the Anti-corn-law League enlisted the ablest platform orators of the day in the service of free trade, his bold and impassioned rhetoric greatly contributed to arouse and intensify public feeling. M. Guizot quotes his speeches as the most finished examples of oratory which the great conflict produced. Their effect upon the vast metropolitan audiences to which they were addressed was electric. F. also contributed by his pen to the success of free trade, and his *Letters of a Norwich Weaver Boy* were largely quoted and read. After the abolition of the Corn Laws, he was invited to stand for Oldham, which borough he has continued to represent, with a brief interval, since 1847. Like most men who enter the House of Commons late in life, F. did not altogether realise the oratorical promise of his platform and pulpit career. His best parliamentary speeches were upon the education of the people. As a politician, he has been a consistent member of the advanced Liberal party. A succession of illnesses, of late years, has interfered with his attendance in parliament. He was among the earliest contributors to the *Westminster Review*, edited for many years the *Monthly Repository*, and has largely contributed to various other organs of public opinion. His *Lectures, chiefly addressed to the Working-Classes*, have been published in 3 vols. He is the author of a philosophical dissertation on *Religious Ideas*, and other theological works.

FOX (*Vulpes*), a genus of *Canidæ* (q. v.), particularly distinguished from dogs, wolves, jackals, &c., by the pupils of the eyes contracting vertically, and in the form of the section of a lens, not circularly. This takes place whenever the eyes are turned to a strong light, and foxes are all nocturnal animals. Foxes are also generally of lower stature in proportion to their length than the other *Canidæ;* they have a roundish head, with a very pointed muzzle, short triangular ears, slender limbs, and a bushy tail. They dig burrows for themselves in the earth, or take possession of holes already existing. They are famous for their cunning, which they exhibit both in their artifices for obtaining prey, and for escaping from danger. They feed on small quadrupeds, birds, eggs, &c.; some of them, however, also partly on fruits and other vegetable substances.—The Common Fox (*V. vulgaris*), a native of most parts of Europe, is the only British species, and is still pretty abundant in most parts of the country, although from many parts it would probably have been extirpated ere now, unless it had been in some measure protected with a view to the sport of fox-hunting. The common fox is reddish brown above, white beneath; the outside of the ears black, a black line extending from the inner angle of the eye to the mouth; the legs mostly black, the end of the tail generally white, although specimens sometimes occur in which it is gray, or even black. There are at least three varieties known in Britain, pretty well marked by difference of size and form—the *Greyhound Fox* being more slender and longer-limbed, and the *Cur Fox*—frequent in upland moorish districts—being smaller than the common variety.



The Common Fox (*Vulpes vulgaris*).

Other varieties occur in the north of Europe. The fox has a gland under the tail, which secretes a very fetid substance, communicating to the whole animal its well-known smell. It breeds once in a year, having usually four, five, or six young ones in a litter. Its usual voice is a kind of yelp. Its senses of sight, hearing, and smelling are very acute. Innumerable anecdotes are on record illustrative of its cunning. The difficulty of setting traps so that they shall not be detected and avoided by it, is well known. Foxes are said to have been observed approaching water-fowl by swimming slowly with a turf in the mouth, so as to remain concealed. A most trustworthy person assured the writer of this article, that he saw a fox approach a group of hares that were feeding in a field, with a slow, limping motion, and having his head down as if eating clover, till he was near enough, by a sudden rush, to secure very different food. Foxes captured in hen-roosts have often been known to simulate death, and to submit to being dragged about and very roughly treated without a sign of life, till an opportunity of escape presented itself. When

driven to their holes, and these are d with traps, they not unfrequently shew ist appreciation of the danger, that they re starvation for days and even weeks an come out. Even when taken young, ion fox can hardly be tamed; and very ices are on record of its shewing even of that attachment to man of which animals are capable, and for which the remarkable. The improbability of any mestic races of dog being at all derived fox, is noticed in the article Dog. ch *renard* appears in English in *reynard*, ar appellation of the fox.—The south of roduces foxes of smaller size than the fox, having the fur of the belly black, by some as a mere variety, by others as a pecies (*V. melanogaster*). They are less is, and to them some of the allusions and te—as of the fox and grapes, &c.—which cord well with the habits of the foxes of nd of Northern Europe.—The Himalaya produce a species of fox (*V. Himalaicus*) lar to the common fox, but of superior rilliancy of colours. The fur is rich and The Black Fox of Northern Asia is also very the common fox, but is entirely of a lack colour, except the tip of the tail, hite; its fur is greatly esteemed, brings a e, and forms an article of export from ka to China.—The Coal Fox (*V. alopex*) arts of Europe, as Switzerland and Bavaria, naturalists regarded as distinct from the ox. It is of inferior size, more timid, and blesome; the tip of the tail is black.— nerica has several species of fox, of which Fox (*V. fulvus*) very nearly resembles the ox of Europe, but is of rather larger size, ter muzzle, eyes nearer each other, and a ously bushy tail. Its fur is also longer, re brilliantly coloured, and much more forming a considerable article of export fur countries; in which, as well as in nd in the northern parts of the United is species is abundant. The Cross Fox is of it, distinguished by a longitudinal dark g the back, crossed by a transverse band houlders. The burrow of this fox 'at first ownwards for four or five feet at an angle twenty-five degrees, it then inclines little, which is a security against inunda- is continued at a depth of about three or rom the surface, until it reaches a point is divided into two or three galleries.' nbers of these foxes are annually tracked arrows, and digged or smoked out of them can farmers.—The Gray Fox (*V. Virgin-* he most abundant species of the southern ending, however, as far north as Canada, s rare. It is of a gray colour, varied with bout the size of the common fox, but not so sometimes eats vegetable substances, such maize. The gray fox exhibits not a little nning for which the common fox is cele- d when pursued by hunters and hounds, known to escape by getting upon the rail and running along it for some distance, so scent was lost. This was on one occasion he newly-laid rail of a railroad elevated swamp. It is not unfrequent for the gray hard pressed, to take refuge in a tree, ly if one which has somewhat fallen from idicular presents itself.—There are a num- her species of fox, Asiatic, African, and ; but the most deserving of notice is the ox (*V. lagopus*), which inhabits the most northern parts of Europe, Asia, and America. It is very plentiful in Iceland, feeding much on ptarmigans, and sometimes on young lambs. Great numbers are found on the shores of Hudson's Bay, particularly during winter, and they have been supposed to migrate thither from still more northern regions; but it has been ascertained that this animal spends the winter even in the most northern regions that have ever been visited by man, braving the cold of Melville Island and Banks's Land, and finding abundance of food in the hares, marmots, ptarmigans, and other animals which also remain there. The Arctic Fox is rather smaller than the common fox; it is more densely clothed with a woolly fur, which on some parts is two inches in length; the tail is extremely bushy; and even the soles of the feet are thickly covered with hair. The colour is pure white in winter, at least in very cold climates; varying to a brownish or bluish colour in summer. It is gregarious, and many burrows are often found together. It is extremely cleanly in its habits, and is quite devoid of the offensive smell which belongs to most of the foxes; it is also much less cunning, and much more easily trapped, as well as much more gentle and capable of being tamed. Its flesh has been sometimes eaten by arctic voyagers, with a relish due to the extreme cold of the climate, and the consequent demand of the system for animal food. Its fur is not nearly equal in value to that of the red fox.

FOXE, John, the martyrologist, was born of respectable parents in 1517, at Boston, Lincolnshire. In 1533, he entered as a student at Brasenose College, Oxford; in 1538, he took his Bachelor's, and in 1543, his Master's degree, and was elected a fellow of Magdalen College. He displayed at an early period an inclination for Latin poetry, and wrote several plays in that language upon scriptural subjects. Of these, the only one that remains, entitled *De Christo Triumphante*, was printed at London in 1551, and at Basel in 1556, 8vo, and 1672. The religious movements of the times led him to study the great controversy between Popery and Protestantism, and becoming a convert to the principles of the Reformation, he was, July 22, 1545, expelled from his college for heresy. His father being dead, and his mother married again, his step-father refused him any further aid, and he was, in consequence, reduced to great distress. For a short time, he was employed as tutor to the children of Sir Thomas Lucy of Charlecote, Warwickshire, and afterwards was engaged by the Duchess of Richmond as tutor to the children of her brother, the Earl of Surrey, then a state prisoner in the Tower. In this capacity he remained during the whole reign of Edward VI., but was never, notwithstanding Anthony à Wood's assertion to the contrary, restored to his fellowship at Magdalen. On June 23, 1550, he was ordained deacon by Ridley, Bishop of London, and preached the doctrines of the Reformation at Reigate. During the reign of Mary, he retired to the continent. On the accession of Queen Elizabeth, he returned to England in October 1559; and in May 1563, he was inducted into the canonry and prebend of Shipton, in the cathedral of Salisbury. He also enjoyed the living of Cripplegate, which he soon resigned, and for a year he held a stall at Durham. In 1575, when some Dutch Anabaptists were condemned to the flames in London, F. interceded for them with Queen Elizabeth and other persons in authority, but without effect. He wrote numerous controversial and other works, but the one that has immortalised his name is his *History of the Acts and Monuments of the Church*, popularly known as *Foxe's Book of Martyrs*, the first part of which was published at Strasburg in 1554. The

first English edition appeared in 1563, in one vol. folio. Sanctioned by the bishops, it was ordered, by a canon of the Anglican Convocation, to be placed in the hall of every episcopal palace in England, and has gone through innumerable editions. It is not a very critical work, as might naturally be supposed, and Roman Catholics deny its trustworthiness. F. died in 1587, in his 70th year, and was buried in the chancel of St Giles's, Cripplegate, London.

FOXES AND FOX-HUNTING. The law with reference to fox-hunting, which is a matter of a good deal of importance in many parts of the country, seems to stand thus in England: 'Though in general all persons who go upon another's lands without permission are trespassers in the eye of the law, yet there are some cases where the trespass is said to be justifiable,' says Mr Paterson, the most recent writer on the subject, and he quotes Blackstone's dictum to the effect that 'the common law warrants the hunting of ravenous beasts of prey, as badgers and foxes, in another man's land, because the destroying such creatures is said to be profitable to the public' (3 Black. *Com.* 212). Care must be taken, however, that no damage be done beyond what is necessary for the public good, for that is the ground on which alone the legal character of fox-hunting can be maintained. It was found, moreover, in the Earl of Essex *v.* Capel (1 Chitt. Game L. 114), that though pursuing a fox on another's land be justifiable, yet, if it take to earth, or to a house there, it is not justifiable to dig or break doors for it. In Scotland, where, from the character of the country, fox-hunting is often impossible, it never has become a national sport to the same extent as in England; and consequently, the rule that one is entitled to enter on the lands of another for the purpose of killing a fox, has been confined to those cases in which he is pursued simply as a noxious beast, and fox-hunting for sport without leave has been held to be punishable as a trespass, and the trespasser held liable for whatever surface-damage he may occasion. In Ireland (by 1 and 2 Will. IV. c. 32, s. 35), persons pursuing with hounds any fox, hare, or deer which has been started elsewhere on another's land, are exempted from summary proceedings for trespass.

FOXGLOVE. See DIGITALIS.

FOXHOUND, a kind of dog much used in Britain for the sport of fox-hunting. It is not quite so large as the staghound, and is perhaps a mixed breed between the staghound or the bloodhound and the greyhound. The colour is commonly white, with large patches of black and tan colour. Their speed and perseverance are remarkable; they have been known 'to run hard for ten hours before they came up with and killed the fox, and the sportsmen were either thrown out, or changed horses three times.'

FOX-HUNTING, from its exciting nature, as well as from the qualities of daring courage and cool calculation requisite in those who thoroughly follow and appreciate it, has long been termed the king of British national sports.

In Great Britain, there are upwards of 100 hunting establishments, of which by far the greater proportion belong to the counties south of the Tweed. Fox-hunting establishments—which are in most instances supported by subscription, though sometimes owned by private gentlemen of wealth and influence—are organised and maintained at a very considerable annual cost, the price of a single pack of foxhounds sometimes amounting to several thousand guineas. Every establishment is under the direct superintendence and control of one experienced gentleman, the *master*, and under him again rank the huntsman, whippers-in, earth-stopper, kennel-servants, &c. A 'pack' is composed of from 20 to 60 couples of hounds, the number greatly depending upon the frequency of hunting-days: thus, some packs hunt six days, some five days, others four, and many only two days a week; 30 couple of hounds is a good average; these are carefully reared, fed, and otherwise attended to. The master himself, as a matter of course, has the general superintendence of the servants, hounds, and horses; and in the hunting-field is general director of the proceedings. Next to him come the huntsman and one or two 'whippers-in' ('whips'). The huntsman, who is practically the most important personage in the field, requires to see that his hounds are properly managed and fed in their kennels; duly led to the place of meeting on hunting-days; and, what is of more consequence still, that they receive fair-play in the field, and find and hunt their foxes in true style. The huntsman requires to be a man of great nerve and much activity: he should also have a good head, a clear ringing voice, a keen eye, and above all he must be a first-rate horseman, and know thoroughly every point in the country over which he hunts. He has often to restrain heedless riders, and 'keep the field back;' a duty requiring firmness of character, with a quiet and civil manner. With these necessary qualifications, and having so many responsible duties on his shoulders, he is treated with great respect by those for whom he provides sport: he is mounted on the best horses his master can produce, and may be said to conduct and direct the hunt from the moment the fox is found till the moment of its death—from 'find to finish.'

The duties of the first whipper-in, though not so responsible as those of the huntsman, are still considerable: for instance, he takes a certain management of the hounds in kennel, assists in conducting the hounds to the 'meet,' and aids the huntsman in various ways during the run. His knowledge of the management of hounds, and of fox-hunting generally, must at the same time be such as to enable him to occupy the huntsman's place in an emergency. The 'second whip's' principal duty is that of bringing up and urging on lagging hounds in the field, by lashing and 'rating.' In many hunts, however, a second whipper-in is dispensed with.

A considerable range of country is necessary for the full enjoyment of fox-hunting, the best being that which is diversified by pasturage and plantation. Being a nocturnal feeder, the fox quits his burrow or 'earth'—which is generally in a gorse brake, or a plantation or covert of underwood—during the night, and returns to it in the morning, and this fact is taken advantage of by those who hunt him for sport. The day and place of 'the meet' are duly advertised, and on the night before the hunt, the coverts to be 'drawn' next day are visited either by a duly appointed *earth-stopper* or by the gamekeeper, who, knowing that the foxes are from home, proceeds, spade in hand, from one hole to another, filling them up with earth and brushwood as he goes. Thus, the fox, upon returning at dawn to his 'earth,' finds ingress denied, and so betakes himself to some neighbouring thicket, or to some unenclosed cover of gorse, rushes, &c., where he makes a temporary lair or 'kennel.' When the earths have been carefully closed, the earth-stopper returns home and informs the huntsman, or first 'whip,' as to their number and locality,

and that information forms a guide for the proceedings of the following day. (After the hunt is over, the earths are reopened, and as little trace as possible left of the work.) The hour of 'the meet' is usually ten or eleven o'clock A.M., and at the appointed place assemble the whole field, including master, huntsman, whippers-in, hounds, and those gentlemen (and frequently ladies) who intend either to participate in the day's sport, or merely to see the 'hounds throw off.' When a covert is reached, the huntsman, by a wave of his hand, or a few familiar words, such as 'Eu in! eu in there! good dogs!' 'throws in' his hounds, following immediately after with the first 'whip.' The mounted gentlemen usually remain outside, and take their directions as to stance, &c., from the master, who from this time forward does his best to control and direct their movements. In fact, the master may be said to have the control of the 'field'—that is, the riders—and the huntsman that of the hounds and hunt. The second whip being posted at the covert side, near where it is expected a fox may burst through or 'break,' one or two of the more eager riders are sometimes permitted to jump their horses into the covert, if it be large, to assist in the finding of the fox. Those who remain outside then prepare themselves for their work, and eagerly listen for the first token of the presence of reynard; this is betrayed by a slight but anxious whimper or whine from the 'challenging' hound—that is, the hound (usually an old and experienced one) that first perceives or 'hits' the scent of a fox—and is soon followed by others, who instantly rush to his side. The huntsman, if he be tolerably certain that the game scented is no other than a fox, at judicious intervals urges on his hounds by familiar expressions, such as 'Yoicks, yoicks, have at him!' 'Push him up!' &c., till the fox is fairly roused from his kennel, and goes away. It not unfrequently happens while drawing coverts, that hounds will come suddenly upon a fox, and seize him before he has time to escape. This is termed 'chopping,' and is always to be prevented if possible. If the covert be very thick, a fox may leave his kennel unperceived; and when he does so, he usually runs through or round the covert for a considerable distance before quitting it for the open fields. He may also 'run his foil,' by doubling back and forward on the same path or track, and thus possibly baffle the hounds, even when they 'own his scent.' In large coverts, too, a fox frequently 'hangs;' that is, he remains in it for a long time before going away. The person who first sees the fox 'break cover,' or, in other words, 'views him away,' should always allow him a certain 'law' before giving the 'view halloo,' as a fox will frequently turn or 'head back' into covert if he hears any unusual noise at the instant of his quitting it. When, however, the person or persons who are watching see that the fox is really off, notice is instantly given to those within the thicket, and those without, by the cry of 'Hou—y! hou—y! Tallyho! *Gone away!* GONE AW—AY!!' upon which the huntsman blows his horn to collect his hounds; the whipper-in drives out lagging members of the pack, either with his whip or by some cry; the master restrains the more impatient of the riders till the huntsman and hounds have 'settled to' their fox; and then he and the entire field join in the chase, and the first, and frequently the most exciting, part of the day's proceedings has commenced—the fox has 'broke cover,' the hounds have been 'laid on,' and the field has entered on its impetuous 'first burst.' A certain etiquette is, however, absolutely necessary in allowing the hounds and huntsman to get away *first;* but after that, each rider, with a certain

Fox-hunting—'Gone away!'

deference to the master, chooses his own place in the hunt, and does his best, independently of his neighbours, to keep at a certain distance, not directly in the line, but to one side and in the rear of the hounds. When a rider happens to be near the pack at the first burst, and gets a good position in following them, he is said to 'get well away with the hounds;' and if well mounted and a skilful rider, his chances of both viewing the hunt and being 'in at the death' are very considerable. And now, as we have already said, begins the grand excitement of the day; the fox being fresh, races away at tremendous speed, followed by perhaps upwards of twenty couple of hounds at full cry. If the day is propitious (a 'southerly wind and cloudy sky' having long retained favour), the scent of the retreating fox lies well, especially at first, when it is called 'burning' or 'breast high,' and is for many minutes 'owned' by at least all the leading hounds in the pack, though, perhaps, the object of pursuit itself is far ahead, and out of sight; and away streams the hunt over hedges, ditches, and gates, across rivers, railways, arable land, and grass pastures, perhaps for several miles before a single *check* occurs. Now, the foxhound hunts almost entirely by scent, and does not, like the greyhound, depend upon the eye. The fact of scent failing, therefore, at any time during the hunt, throws out the hounds, and prevents them from renewing it, until the scent is recovered, or 'hit off.' When the scent is 'burning,' hounds run almost mute, though at first, and at intervals afterwards, they usually 'throw their tongues' pretty freely. When all the hounds are giving tongue, they are said to be at 'full cry,' and 'carry a good head,' the scent being on such occasions so thoroughly diffused as to be felt or 'owned' breast high by probably every member of the pack. Sometimes scent becomes so faint as to be hardly perceptible, and when this is the case, the energy of the hounds abates considerably; they then run with their heads close to the ground, and are said to hunt a 'cold' scent. Here, however, a little timely assistance from the huntsman is of the greatest moment in restoring animation to the pack. He waves his cap, blows his horn, and encourages his hounds by well-known expressions, to renewed exertions. When, as frequently happens from various causes, the scent fails entirely—such as the fox

crossing water, running through a drove of sheep, 'heading back' in another direction, running along or lying upon the tops of walls or thick hedges, &c.—the hounds cease 'giving tongue,' suddenly stop, throw up their heads, and are 'at fault.' In this emergency, the 'field' remains at a respectful distance behind, and the huntsman knowing, or at least guessing by experience which way the fox has taken, or the special means he has adopted for foiling the scent, allows his hounds at first, for a few moments, themselves to attempt to regain it; but failing that, and finding that his interference and assistance are necessary, he instantly blows his horn, and calls or 'lifts his hounds' from the place, and 'takes a cast' round and round about the spot where the scent failed, cheering them on the while. Thus, by gradually widening his casts, the scent is very frequently recovered or 'hit off,' a circumstance which is soon made apparent by the whimper of recognition given by the hound that first 'owns it,' followed by the answering tongues of the whole pack. When the hounds, however, fail to 'hit off' the scent, if the day be far advanced, they are taken home, or they are trotted on to some neighbouring covert, which is drawn for a fresh fox.

When the fox is killed, either in 'the open' or elsewhere, the rider who is first in at 'the death'—usually the huntsman—springs off his horse, with a 'Whoo! whoop!' lashes the hounds off, and cuts off the head, feet (*pads*), and tail (the *brush*). He then flings the carcass to the hounds, who tear it to pieces, and devour it in a very few minutes. The brush is usually presented to any lady who may happen to be in at the death, or is claimed as a trophy by one or other of the gentlemen present. The *pads* likewise are distributed amongst those who may wish to preserve mementos of the chase. As a general rule, the huntsman, and several of the best mounted in the field, manage to be in, either at or immediately after the death, though instances are not wanting when, during unusually protracted runs, the hounds have left every rider far behind, and have followed and killed their fox miles away from the spot where the last horseman had given in. A strong fox will 'live' before hounds on an average for an hour or an hour and a half; but cases have been known when this has been far exceeded, and when the run has extended to thirty or even forty miles, and has lasted all day, and even into the night. Young foxhounds begin their career by what is termed *cub-hunting;* but this, however necessary it may be for teaching them, is considered inferior sport to regular hunting.

The midland counties of England, such as Leicester, Northampton, Warwick, Yorkshire, &c., are the best

Blood Hunter clearing a stone wall in good style (from Blaine's *Encyclopedia of Rural Sports*).

for hunting purposes in Great Britain; and owe their superiority in a great measure to two causes: 1*st*, the strict preservation and consequent number of foxes; and 2*d*, the extensive tracts of pasturage being favourable both for running and scent. The instinct of the fox leads him, as a general rule, to run *down* wind, that his scent may not be blown *to* the hounds; he also takes advantage of every peculiarity in a country likely to offer him an advantage over his foes.

The fox-hunter must be possessed of considerable courage, united with coolness, and must be a judge of pace and have a good eye in 'riding to hounds,' to avoid tiring or 'overmarking' his horse unnecessarily. Much of the excitement and pleasure of the fox-hunter consists in his successfully leaping the various hedges, ditches, fences, &c., encountered; but at the same time, a really skilful and humane rider, however well mounted, will never knowingly urge his horse at a fence or leap of any kind, unless he is positively certain it is within his horse's power; and if he finds his horse betrays symptoms of distress, he will rather turn its head homewards, and forego the chase, than overtax its courage and strength.

Much useful and entertaining information on fox-hunting occurs in Blaine's *Encyclopædia of Rural Sports* (London, Longmans); *British Rural Sports*, by Stonehenge; Beckford's *Thoughts on Hunting; Reminiscences of a Huntsman; Nimrod; The Field* newspaper; &c.

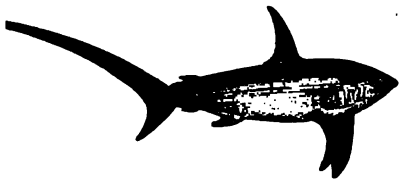
Fox-hunting is not practised after the English

n the northern states of America, but in the . states from Maryland to Florida, it is a ı amusement. The object of pursuit, how- he *Gray Fox* (*Vulpes Virginianus*), and the not so severe, and seldom lasts so long as he common fox.

ISLANDS, another name for the ALEUANDS (q. v.).

RIVER is the name of two considerable in the United States of America, both of ing in Wisconsin.—1. The F. R., or *Pishtaka*, uent of the Illinois, which is itself a tribu- he Mississippi. It is 200 miles long, and is chiefly for its water-power.—2. The F. R., *th*, after a course of about the same length, o Green Bay in Lake Michigan. It is into two sections by Lake Winnebago, the ne being connected by a canal with the in, so as to link together the Mississippi and .t Lakes of the St Lawrence.

SHARK, or **THRESHER** (*Alopias* or *s*), a genus of sharks, containing only one species (*A. vulpes*), an inhabitant of the anean and of the Atlantic, and occasionally



Fox Shark (*Alopias vulpes*).

he British coasts. The snout is short and the spout-holes are very small; the mouth large as that of the white shark, nor the formidable; but the F. S. is extremely voracious, readily attacking grampuses or much larger than itself. Its most remark- ıliarity is the great elongation of the upper he tail-fin, which is nearly equal in length whole body, and into which the vertebral extends. Of this it makes use as a weapon, with great force. It is said to be not uncommon for a whole herd of dolphins to take flight at the first splash of the tail of a fox shark. From the use which it makes of its tail, it has acquired the name of Thresher. It attains a length, tail included, of 13 feet. The body is spindle-shaped.

Grass (*Alopecurus pratensis*): a, flumes; b, floret.

FOXTAIL GRASS (*Alopecurus*), a genus of Grasses, distinguished by a spiked panicle, two *glumes* nearly equal, and generally united at the base, enclosing a single floret which has a single *palea*, with an awn rising from the base. The species are chiefly natives of temperate countries, and about six are British. MEADOW GRASS (*A. pratensis*), which has an erect culm about 1½—2 feet high, and a cylindrical obtuse panicle abundantly covered with silvery hairs, is one of the best meadow and pasture grasses of Britain, but does not arrive at full perfection till the third year after it is sown. It bears mowing well and is reckoned a good grass for lawns. It bears drought well. The JOINTED FOXTAIL GRASS (*A. geniculatus*), with an ascending culm bent at the joints, is very common in moist places, and cattle are fond of it, but it is a small grass. The SLENDER FOXTAIL GRASS (*A. agrestis*) is an annual or biennial, of little value except for light sandy soils, on which it is sometimes sown. A foreign species (*A. nigricans*), a native of the continent of Europe and of Siberia, has been introduced into Britain, and appears likely to prove valuable. It has somewhat creeping roots, is a little larger and stronger than *A. pratensis*, and is rather earlier.

FOY, MAXIMILIEN SÉBASTIEN, a distinguished French general and orator, was born at Ham, 3d February 1775. In 1791, he was one of the volunteers who hastened to defend the frontiers of their country against foreign invasion, and during the next nine years served with distinction under Dumouriez, Moreau, and Massena. In 1800, he was raised to the rank of adjutant-general in the division of Moncey, in the army of the Rhine, which marched through Switzerland into Italy, where he commanded the vanguard of the army in 1801. In 1805, he commanded the artillery of the second division in the Austrian campaign. In 1807, Napoleon sent him to Turkey at the head of 1200 artillerymen, to assist Sultan Selim against the Russians and British. After the revolution in which Selim was dethroned, F., under the direction of the French ambassador, General Sebastiani, defended Constantinople and the Strait of the Dardanelles so effectively, that Duckworth, the British admiral, was obliged to retire with loss. From 1808 to 1812, F. was general of division of the army in Portugal. His talents were exhibited to advantage in conducting the retreat of the French army across the Douro. F. was present at all the battles of the Pyrenees, and at Orthez, in 1814, was dangerously wounded. In the campaign of 1815, he commanded a division on the field of Waterloo, where he was wounded for the fifteenth time. In 1819, he was elected deputy by the department of Aisne. In the chamber, he was the constant advocate of constitutional liberty, and shewed great rhetorical talent and knowledge of political economy. He distinguished himself particularly by his eloquence in opposing the war against Spain in 1823. F. died at Paris, November 28, 1825. Madame Foy published, in 1827, from her husband's papers, a *Histoire de la Guerre de la Péninsule*. In the previous year appeared his *Discours*, with a biography.

FOY'ERS, a stream rising in the Monadleadh Mountains, in the middle of Inverness-shire. It runs 12 miles north, and falls into the east side of Loch Ness, nearly opposite Mealfourvounie Mountain. It has two celebrated falls within a mile and a half of its mouth, where the stream rushes through a deep, narrow ravine in the hills, skirting the east side of the loch. The upper fall is 30 feet high. The stream then descends 30 feet in a quarter of a mile. The lower fall (specially called *The Fall of Foyers*) is 90 feet high. It is the finest cascade in Britain.

FOYLE, LOUGH, an inlet of the Atlantic, on the north coast of Ireland, between the counties of Derry and Donegal. It is triangular in form, 16 miles long from north-east to south-west, 1 mile wide at its entrance, and 9 miles broad along its south side. A great part is dry at low water, and its west side

alone is navigable. Vessels of 600 tons ascend the west side of the lough, and its chief tributary the Foyle (which comes 16 miles from the south), to Londonderry. On the east shore is a flat strand with a sandy beach, on which, in 1827, was measured a line of 41,640, which was afterwards extended by triangulation to about 53,200 feet, and formed the base line of the Ordnance Survey of Ireland.

FRA BARTOLOMEO. See BACCIO DELLA PORTA.

FRACASTORO, GIROLAMO, an Italian savant and philosopher, famous for the universality of his learning, was born of an ancient family at Verona in 1483. At the age of 19, he was appointed professor of logic in the university of Padua. But his vast knowledge embraced the most divergent sciences, and on account of his eminence in the practice of medicine, he was elected physician of the Council of Trent. His Latin verse also exhibits remarkable elegance. He died in 1553. A bronze statue was erected in his honour by the citizens of Padua, while his native city commemorated their great compatriot by a marble statue. His writings in prose and verse are numerous. The chief are—*Syphilidis, sive Morbi Gallici* (Verona, 1530, in 4to; Paris, 1531 and 1539, in 8vo; London, 1720, in 4to, and 1746, in 8vo; Italian edition, Verona, 1739, in 4to, by Tiraboschi; Naples, 1731, by Pietro Belli); *De Vini Temperatura* (Venice, 1534, in 4to); *Homocentricorum sive de Stellis, De Causis Criticorum Dierum Libellus* (Venice, 1535, in 4to); *De Sympathia et Antipathia Rerum, De Contagionibus et Contagiosis Morbis, et eorum Curatione* (Venice, 1546, in 4to; Lyon, 1550, 1554, in 8vo). The collective works of F. appeared for the first time, Venice, 1555, in 4to.

FRA'CTED, heraldically, signifies broken asunder.

FRACTION. In Arithmetic, a fraction is any part or parts of a unit or whole, and it consists of two members, a denominator and a numerator, whereof the former shews into how many parts the unit is divided, and the latter shews how many of them are taken in a given case. Thus $\frac{3}{4}$ denotes that the unit is divided into four parts, and that three of them are taken; and more generally $\frac{a}{b}$ denotes that the unit is divided into b parts, and that a of them are taken. A fraction is called *proper* when the numerator is less than the denominator, and *improper* when the numerator is greater than the denominator. In Algebra, any quantity $\frac{a}{b}$ is called a fraction, although a and b are not necessarily representatives of whole numbers, as they would require to be if the fraction be an arithmetical fraction. The algebraical fraction $\frac{a}{b}$ just means that any quantity affected by it is to be *multiplied* by a, and *divided* by b. This definition, however, through the greater generality of algebra, includes that of an arithmetical fraction. The rules for the addition and multiplication of fractions are the same in algebra and arithmetic. To add two or more fractions together, we must bring them to a common denominator, and add the numerators for a new numerator, and take the common denominator for the new denominator. Thus if $\frac{a}{b}, \frac{c}{d}$ be two fractions, then $\frac{a}{b} + \frac{c}{d} = \frac{ad}{bd} + \frac{cb}{bd} = \frac{ad + bc}{bd}$, the fractions being brought to a common denominator by (as a general rule) multiplying each numerator by every denominator, except its own, and multiplying all the denominators for the common denominator. To subtract two fractions, we bring them to a common denominator, and subtract their numerators for the new numerator. Thus $\frac{a}{b} - \frac{c}{d} = \frac{ad - bc}{bd}$. To multiply two fractions together, the rule is, to multiply the numerators together for a new numerator, and the denominators together for the new denominator. Thus $\frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd}$. The reasons for all these rules are obvious. The rule of division is to invert the divisor, and proceed as in multiplication. This follows from the consideration, that to *divide* is the inverse of to multiply, and that to divide by $\frac{a}{b}$ must be the same thing as to multiply by $\frac{b}{a}$.

FRACTIONS, CONTINUED. If $\frac{A}{B} = a + \frac{a_1}{B}$, and $\frac{B}{a_1} = b + \frac{b_1}{a_1}$, and $\frac{a_1}{b_1} = c + \frac{c_1}{b_1}$, and.... $\frac{k_1}{l_1} = m + \frac{m_1}{l^1}$, and $\frac{l^1}{m_1} = n + \frac{n^1}{m_1}$, &c.

Then

$$\frac{A}{B} = a + \cfrac{1}{b + \cfrac{1}{c + \cfrac{1}{d + \ldots. \cfrac{1}{\ldots. m + \cfrac{1}{n + \ldots.}}}}}$$

This expression for the value of $\frac{A}{B}$ is called a continued fraction. If we consider the fractions (1) $\frac{a}{1}$, (2) $a + \frac{1}{b}$ or $\frac{ab + 1}{b}$, (3), $a + \cfrac{1}{b + \cfrac{1}{c}}$ or $\frac{(ab + 1)c + a}{bc + 1}$ formed by taking into account parts only of the denominator in the continued fraction, we obtain a series of fractions *converging* to the value of $\frac{A}{B}$. These converging fractions are always approximating to the value of $\frac{A}{B}$, and are alternately greater and less than it. Throughout the series, the 1st, 3d, 5th, 7th, &c., are each below the true value, while the 2d, 4th, &c., are above it; or *vice versa*, according as the original fraction is improper or proper. It can be shewn that the successive converging fractions approach nearer and nearer to the true value of the continued fraction. Converging fractions are of great use in the summation of infinite series.

In illustration of the above general statement, let us take the numerical fraction $\frac{6935}{2151}$, which we first reduce to a continued fraction in the following manner: $\frac{6935}{2151} = 3 + \frac{482}{2151} = 3 + \frac{1}{\frac{2151}{482}} = 3 + \frac{1}{4 + \frac{223}{482}}$ = (by continuing the same process)

$$3 + \cfrac{1}{4 + \cfrac{1}{2 + \cfrac{1}{6 + \cfrac{1}{5 + \cfrac{1}{7}}}}}$$

or, as it is now commonly written, $3 \frac{1}{1} + \frac{1}{4} + \frac{1}{2} + \frac{1}{6} + \frac{1}{5} + \frac{1}{7}$

first convergent is 3; the second, $3 \frac{1}{1 + \frac{1}{4}}$

e third is $3 \frac{1}{1 + \frac{1}{4 + \frac{1}{2}}} = 3 + \frac{2}{9} = \frac{29}{9}$;

ng the other convergents in a similar ve have the following approximations to of the original fraction:

$$3, \frac{13}{4}, \frac{29}{9}, \frac{187}{58}, \frac{964}{299}, \frac{6935}{2151}.$$

ences between the successive convergents riginal fraction are,

$$3 = \frac{482}{2151} \left(\text{being less than } \frac{1}{1 \times 4}\right),$$

$$\frac{5}{51} = \frac{223}{8604} \left(\text{being less than } \frac{1}{4 \times 9}\right), \text{ &c.;}$$

neral the difference between any convergent riginal fraction is less than a fraction $= \frac{1}{\text{convergent} \times \text{denom. of conv. next greater}}$;

itly, the differences grow less as we owing to the denominators of the conver- ays increasing. If, by actual subtraction, successively the difference between each t and the original fraction, we shall also they are alternately greater and less, or greater, according as the original fraction or improper.

TIONS, VANISHING. In some algebraical the substitution of a particular value for wn quantity will make both the numer- denominator of the fraction vanish; such are called vanishing fractions. Thus the $\frac{x^2 - 1}{x - 1}$ assumes the form $\frac{0}{0}$ when $x = 1$.

tainment of the value of such a fraction articular value of the unknown quantity es it the form $\frac{0}{0}$, may in all cases be by a general method furnished by the l calculus. But frequently that value etermined by simpler means, as the form $\frac{0}{0}$ n the existence of a factor common to both r and denominator, which becomes zero for lar value of x; if, then, we can discover or, either by finding the greatest common or otherwise, and divide it out, then by on we obtain the value of the fraction ding to the particular value of x. Thus, in ple given, we find that both terms are by $x - 1$, so that $\frac{x^2 - 1}{x - 1} = x + 1$. There- n $x = 1$, and the fraction becomes $\frac{0}{0}$, its ist equal 2. This is an example of the n of the method of Limits to the determin- he value of such a fraction, for it is clear every value of $x > 1$, the value of the s > 2, and continually approaches 2 as x s 1. Much discussion has taken place as r vanishing fractions have, properly speak- s or not; but this is not the place for speculations on the subject. See LIMITS, OF; and NOTHING, and INFINITY.

TURE of a bone may be the result of muscular action, or disease. The long the limbs are more subject to the latter s than those of the head or spine. *Pre- causes* to fracture are frosty weather, cancerous disease, a morbidly brittle con- led *fragilitas ossium*.

ones, as the kneepan and heel-bone, are give way from sudden contraction of the hich are inserted into them. The subject jury then falls, and attributes the accident to the fall, whereas it is the reverse. A medical man, some few years ago, awoke with a fit of cramp, and almost immediately his left thigh-bone broke with a snap. It reunited in the usual time. The sufferer from cancer of long standing, sometimes feels a bone give way under no special strain. In such cases, there is seldom any attempt at repair. The bones of old people are brittle from the excess of earthy materials (see BONE), and so readily give way. The bones of the feeble patient, with fragilitas or mollities ossium, are soft and friable, and when examined, are found saturated with a greasy substance.

There are some persons who seem liable to fracture without any such reason. Professor Gibson of America mentions a boy who, though apparently healthy, had broken his collar-bones eight times, his arm and forearm, while his leg and thigh were broken if he but tripped his foot on the carpet. An old lady once broke both thigh-bones kneeling down in church. There is one predisposing cause to fracture fortunately now but seldom seen—viz., scurvy. Not only did it make the bones brittle, but, as was seen in Lord Anson's expedition, which was manned chiefly by pensioners, old fractures again became disunited.

Repair of a broken Bone.—Of course, as the bone lies in the midst of soft parts, any injury to the one must tear the other, and cause an infusion of blood; but the latter is speedily absorbed, and is of no service in the process of repair. After the first excitement has passed off, a fluid is effused around the fragment, which in a short time becomes converted into bone. The amount of this new material depends upon the position of the fragments; should they be far apart, or, as it is technically termed, riding, then a much larger quantity of new bone is thrown out. We see this in animals to such an extent that the materials for repair, or 'callus,' may be divided into two separate parts—a provisional callus to act as a wrapper to the bones until the permanent callus, or that which unites the ends, however far apart, becomes sufficiently hard; then the provisional callus, being no longer necessary, is removed by absorption.

Symptoms of Fracture.—A broken limb hangs loose, and is, as a general rule, no longer under the control of the muscles, which, however, are pricked by the broken ends of bone, and stimulated into painful spasms, which still further displace and deform the limb. Should there be any doubt, the limb may be carefully raised, and turned gently from side to side, when a peculiar rough feeling termed *crepitus* removes all doubt. Each bone, however, when broken, exhibits symptoms peculiar to itself, and requires a separate treatment.

Fractures are divided into *Simple*, when there is no wound in the skin which communicates with the fracture; *Compound*, when there is such a wound; *Comminuted* being prefixed to either of these terms when the bone is broken into several pieces; *Impacted*, when one fragment is driven into the other; and *Complicated*, when a neighbouring joint or large blood-vessels participate in the accident.

Treatment of Fracture.—Replace the fragments as near as possible to their former positions by gentle extension, retain them in place by substituting an *external* rigid skeleton, made of any unyielding material which will be firm enough to resist the spasms already alluded to, but is not fastened with very great tightness to the limb. *Splints* are generally of wood or pasteboard; but of late years gutta percha has been much used. In simple fractures, it is often sufficient to adapt a bandage to the limb, which will harden on drying, and form a *shell* for it; for this purpose, starch, dextrine, and plaster of

Paris are generally used. Whatever the splint be made of, it must keep the bones in a state of *complete rest*, otherwise the lymph, which would be formed into bone, stops, as it were, half way, and becomes fibrous tissue, which allows the fragments to move on each other, and is termed a false joint.

FRA DIA'VOLO, properly MICHELE PEZZA, a celebrated brigand and renegade monk, born in Calabria in 1760. Of plebeian origin, he at first followed the trade of stocking-weaver, then entered the Neapolitan army, and subsequently the service of the pope; finally, he abandoned military life, and became a monk, but being expelled for misconduct, he withdrew to the mountains of Calabria, where he headed a band of desperadoes, whose strongholds lay chiefly in the district between Itri and Terra di Lavoro. Pillage, bloodshed, and atrocious cruelties, signalised his career. For years he evaded the pursuit of justice by retiring to his haunts amidst mountains and forests, and skilfully defeating, with much inferior numbers, all the armed forces despatched against him. He became at length known among the peasantry of the neighbourhood as Fra Diavolo. On the advance of the French into the Neapolitan states, F. D. and his band espoused warmly the royal interests, and in return were not only pardoned and reinstated in civil rights, but promoted to the grade of officers in the royal army, F. D. himself becoming colonel. In 1806 he attempted to excite Calabria against the French, but was taken prisoner at San Severino, and was executed at Naples in November of the same year. The opera of Auber has nothing in common with F. D. but the name. He died uttering imprecations on the queen of Naples and the British admiral, Sidney Smith, whose influence had not sufficed to rescue him from death, although on his capture he produced papers bearing the royal seal, which vouched for his right to the rank of colonel in the royal forces.

FRAGA'RIA. See STRAWBERRY.

FRAME, in Gardening, the covering of any kind of hotbed, flued pit, or cold pit, used for the cultivation of plants not sufficiently hardy for the open air. Frames are of various materials, but generally of wood or iron and glass, and are made in one piece or in sashes according to the size of the hotbed or pit.

FRAME-BRIDGE, a bridge built of timbers framed together in such a manner as to obtain the greatest possible amount of strength with a given quantity of material.

The fundamental principle upon which all such construction is based, is that the timbers shall be so arranged that the weight put upon them shall exert a pulling or a crushing strain, instead of a transverse strain, and, if possible, that the greatest strain shall act as a direct pull in the direction of the fibres of the wood. The construction of a frame-bridge is very similar to that of a roof, excepting that in the bridge a considerable outward thrust upon the abutments is generally permissible, while the walls of a house will

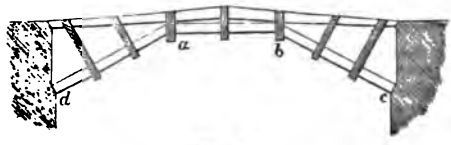


Fig. 1.

not stand this; and that for the bridge a nearly level way on the top is desirable, while for a roof a steep incline is not objectionable, or is even desirable. Fig. 1 represents a simple and useful form of frame-bridge. It will be seen at once that a weight upon the bridge will exert a pulling strain upon the horizontal timber *ab*, and a crushing strain upon *bc* and *ad*, as well as upon the upper timbers, and that the main support is in *ab*, which must be torn asunder before *ad* and *bc* can be bent or displaced to any considerable extent.

The celebrated frame-bridge of Schaffhausen, constructed in 1757 by Grubenmann, a village carpenter, was built exactly in the manner of a roof with a horizontal pathway superadded. It was composed of two arches, one 193 feet, the other 172 feet span. It was merely laid upon the piers, and did not abut against them to exert any outward thrust, as will be seen by fig. 2. The

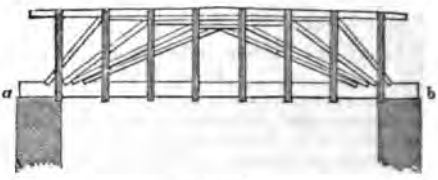

Fig. 2.

weight on the bridge is transmitted by the oblique beams, which by analogy we may call *rafters*, to the tie-beam *ab*, where it exerts a horizontal pulling strain. These rafters are framed into the tie-beam so as to abut firmly against it in the same manner as Roof-rafters (see ROOF). This kind of frame-bridge is very common in Switzerland, where timber-bridges abound; and it has doubtless originated from the fact, that most of the bridges have been built by the local carpenters, who are accustomed to the construction of roofs of considerable span for the commodious square-built wooden cottages with overhanging roofs, so common in that country. Frame-bridges of more complex structure are sometimes built; in some of these, the timbers are framed so as to present an arched form. In these cases, the structure is very similar to those described and figured under CENTERING. The serious defect of all such bridges is their liability to decay from exposure to moisture, &c., especially at the joints, where water is apt to lodge and remain, from want of free circulation of air to evaporate it. In the bridge of Schaffhausen above described, it was found that when it had stood but 26 years, the oak-beams, where they rested on the masonry at *a* and *b*, fig. 2, were rotted, and the frames began to settle. This was remedied by a carpenter named Spengler, who raised the whole structure upon piles by means of screw-jacks, and replaced the decayed wood. Means should be adopted to admit the free circulation of air in those parts where the timber rests upon the masonry, and to prevent water from settling in the timber joints. The covered bridges of Lucerne and other parts of Switzerland are well known as objects of special interest to tourists, who usually imagine that the roofs are made for the comfort of travellers, but their main object is the preservation of the bridge.

FRAMING, the jointing, putting together, or building up of any kind of artificers' work. The framing of timber generally is described under CARPENTRY, and special kinds of framing under CENTERING, DOOR, FLOORS, FRAME-BRIDGE, PARTITIONS, ROOFS, &c. In such trades as mathematical, optical, philosophical, and other complex instrument-making, the workman who does flat-filed work, and fits all the parts, and puts the whole instrument together, is called the *framer*, and his work *framing*.

tch-trade, the man who frames all the parts and builds up the watch is called a finisher, work is called finishing, though it corre- ith what is called framing in other trades.

MLINGHAM, or 'Strangers' Town,' a the east of Suffolk, on the left bank of the iles north-north-east of Ipswich. It con- a large market-place, from which a few regularly branch out. The church is built flint and stone, and contains the monu- Thomas Howard, third Duke of Norfolk, is duchess, and of the unfortunate Henry Earl of Surrey, and of his countess. Here remains of a castle with thirteen square where Queen Mary retired after the death other Edward VI. *Pop.* (1861) 2252.

IC, a French silver coin and money of which (since 1795, when it supplanted the rnois) forms the unit of the French mone- em, and has also been adopted as such by and Switzerland. The franc is coined of ne-tenths fine, and weighs five grammes, its ng about 9½*d*. One pound sterling = 25·2 The franc is divided into 00 centimes, but ivision into 20 sous is still made use of in life. There are in France silver coins of 5, nd 5 francs; and gold pieces of 20 and 40 Sardinia has also adopted the French money- mly that the franc is called *Lira nuova*.

CAVILLA, a town of Naples, in the pro- Otranto, is situated on an elevation 22 miles st of Brindisi. It is well built, has a college, spitals, and several convents; has manufac- oollens, cottons, and earthen-ware, and, with dent villages, has a population of 5,300.

CE, the most westerly portion of Central extends from 42° 20′ to 51° 5′ N. lat., and 15′ E. long. to 4° 54′ W. long. It is on the N. by the Channel and the Straits r, which separate it from England, by the grand-duchy of Luxembourg, and the provinces of Prussia and of Bavaria; on y the grand-duchy of Baden, from which parated by the Rhine, by several of the ntons, and by Sardinia; on the S. by the anean and the dominions of Spain, from is separated by the Pyrenees; and on by the Atlantic (the Bay of Biscay). The length of F., measured from Dunkirk in h to the Col de Falgurès in the south, 620 miles; and its greatest breadth from west, measured from Kehl, on the Lower Cape St Matthieu, in Finisterre, is about s. Its circumference, inclusive of sinuo- estimated at nearly 3100 miles, or 5000 es, of which nearly the half is composed me coast-lines, which are subdivided in portion of about 600 kilom. on the Medi- n, 950 kilom. on the Atlantic, and about m. on the northern frontiers. The super- s of F. including the new Savoy provinces, nsive of the isle of Corsica, is reckoned 78 sq. miles; and as the Corsican island rea of about 3350 sq. miles, the total is sq. miles. The possessions of F. which are in non-European parts of the world, have superficial area of about 73,700 sq. miles, ter part of which (150,540 sq. miles) is by Algiers. F. is divided into eighty-nine ents (inclusive of Savoy and Nice), most h have been named from the rivers or ns by which they are intersected. The g table gives the names of the ancient pro- F., with the corresponding départements, as in hectares, and the population for 1856.

Provinces.	Départements.	Area in Hectares.	Population in 1856.

			In 1858.
35. Savoy.	87. Savoie,	642,074	318 000
	88 Savoie (Haute),	451,492	266,000
	89. Alpes Maritimes,	429,874	192,000

The province of Savoy and the arrondissement of Nice, incorporated with Grasse in the new département of the Alpes Maritimes, were ceded to F. by Sardinia, in accordance with a treaty between th two governments, signed in 1861. The followin table gives the colonial possessions of France:

	Area given in Hectares.*	Total Population in 1857.	Native Population.	Acquired in
I. Africa—				
Algiers,	47,000,000	363,672	2,183,199	1830
Dependencies of Senegal,	1,534	31,990	31,190	1637
Mayotte and Nossi Bé,	120,975	28,300	28,100	1638
St Pierre and Miquelon,	21,023	2,050	nearly 2,000	1638
In Asia—				
East Indian Settlements,	48,962	225,500	223,000	1672
In America—				
Guyana,	15,000,000	16,700	15,000	1604
Martinique,	98,782	136 460	126,460	1635
Guadeloupe and Dependencies,	167,518	131,550	120,550	1635

* The hectare = 2·47 acres.

The Oceanic settlements are the Marquesas islands (pop. 20,000), occupied by F. in 1842 in virtue of a treaty with the chiefs; New Caledonia, lying in the equatorial zone, about 10° east of Australia (pop. 50,000), and taken possession of in the name of F. by Rear-Admiral Febvrier-Despointes in 1853; and the island of Tahiti and the Wallis Islands (pop. 9000), which have been under the protectorate of F. since 1843.

Population.—The population of F. has not exhibited the same rate of increase as other first-class European powers during the present century, for while the population of Great Britain has nearly doubled within the last fifty years, that of F. scarcely shews an increase of 40 per cent. for the same period.

The following table shews the condition of the population from the beginning of the century to the date of the latest census:

Year of Census.	Number of Population.	Annual Increase.
1801	27,349,003	149,941
1806	29,107,425	351,685
1821	30,461,875	90,292
1826	31,858,937	279,415
1831	32,569,223	171,787
1836	33,540,901	194,337
1841	34,217,719	135,362
1846	35,400,486	236,553
1851	35,783,170	76,537
1856	36,039,364	51,236
1861	37,382,225	268,572

Coast, Islands, and Frontier.—The north-north-west coast is generally irregular, indented with numerous bays, the principal of which is the Bay of St Malo, in which lie the Channel Islands, Jersey, Guernsey, &c., which belong geographically to F., the archipelago of Bréhat, &c. The west-south-west coast is at first lofty and precipitous, but to the south of Bretagne it becomes more shelving, and is interspersed with isolated rocks and promontories; while south of the Loire it is low, and lined with salt-marshes. but towards the foot of the Pyrenees it again assumes a rocky and precipitous character. This coast forms one side of the bay designated by the French as the Bay of Gascogne, but by the English as the Bay of Biscay. Here lie the islands of Ushant (Ouessant), Belleisle, Noirmoutier, Isle d'Yeu, Ré, Oléron, &c. The coast of the Mediterranean, which is broken by lagoons or shore-lakes, is low till it has passed Toulon, after which it becomes bolder. The only islands off the shore are the Hyères, near Toulon; the larger island of Corsica (q. v.) lies north of Sardinia. The Mediterranean here forms two bays or gulfs, as the Gulf of Lyons (Fr. *Golfe du Lion*, so named from the violence of its storms), and the Gulf of Genoa, which belongs only in part to France. The land frontiers of F. are formed on the side of Spain by the Pyrenees; on that of Sardinia and Switzerlan by the Alps and Jura chain; on that of Baden, the Rhine; on the north-east, the frontier line unprotected by natural boundaries, but is defend by various strong fortresses, as those of Strasbou Besançon, Metz, Sedan, Mezières, Givet, Val ciennes, Lille, &c.

Plains.—The chief plains are those of Lorrai Alsace, and Burgundy; and the great north-w Oceanic plain, embracing the lower basins of t Seine, Loire, and Garonne. There are four gr mountain chains belonging to France: the Pyren (q. v.), which separate the French territory fr Spain; the Cevenno-Vosgian range, formed of t Cevennes (q. v.), running east and west betwe the Rhone and Loire, and the Vosges (q. v inclining north and south, and running betwe the Rhine and Moselle; the Alps (q. v.), whi separate the Swiss territory from the newly acquir provinces of Savoy and Nice; and the Sardo Cor can range, which belongs, as the name implies, the islands of Sardinia and Corsica, and traver the Corsican island from its extreme northern its southern extremity. The highest peaks in t Pyrenees, the Maladetta and Mont Perdu, respe tively attain an elevation of 10,886 feet and 10,9 feet; in the Cevenno-Vosgian range, the greate height (the Widderkalm) does not greatly exce 7000 feet. The French portion of the Alps no includes several of the highest mountains an most elevated passes of the range, as Mont Bla 15,744 feet; Mont Iseran, 13,272 feet; Mont Cen 11,457 feet; and the pass of Little St Bernar 7190 feet; that of Mont Cenis, 6770 feet abo the level of the sea, &c. In Corsica, the highe peak rises to an elevation somewhat above 900 feet. The grand water-shed of F. is the Cevenn Vosges chain of mountains, which determines th direction of the four great rivers, the Seine, th Loire, the Garonne, and the Rhone; the first thre of which flow north-west into the Bay of Biscay the English Channel, and the fourth into the Gu of Lyons. Besides these, the more important strea are the Rhine (as a boundary river), the Mosel Meuse, and Scheldt or Escaut (all of which lea leave France, and flow into the Netherlands, Rhenish Prussia); the Somme and Orne (belongi to the basin of the Seine); the Vilaine and th Charente (belonging to the basin of the Loire); an the Adour (rising in the Pyrenees, and flowing int the Bay of Biscay at the extreme south-west France). The Oise, the Aube, the Yonne, and th Marne are the chief affluents of the Seine; th Sarthe, the Loir, the Allier, and the Cher, of th Loire; the Dordogne, the Lot, the Tarn, and th Gers, of the Garonne; and the Saone, the Isè and the Durance, of the Rhone.

The entire extent of river-navigation in F. amounts to 5500 miles, or 8,900,000 mètres, while the 99 larger canals, which have been constructed either to connect these river-courses or to supply entirely new channels of water-communication, extend over a length of 2900 miles, or 4,700,000 mètres. The most important of these works are the canals connecting Nantes, and Brest, and the Rhone with the Rhine, and the canals of Berry, Nivernais, and Bourgogne. F. possesses only one lake of any importance, Le Grand-Lieu, a little to the south of Nantes, which has an area of about 14,300 acres; but the country abounds in salt marshes or ponds, more especially in the districts of Gascony, Roussillon, and Languedoc.

F. is peculiarly rich in mineral springs, of which there are said to be nearly 1000 in use. Of these, more than 400 are situated in the group of the Pyrenees, where there are 93 establishments for their systematic use. It is estimated that there are, moreover, fully 4000 springs not hitherto employed.

Geology, &c.—F. presents a great variety of geological formations, but although we meet with an almost complete succession of all the stratified and non-stratified strata, they are distributed with great inequality. Thus, for instance, while nearly one-third of the soil is composed of tertiary formations, a mere fractional part only is made up of coal-beds. A belt of primary rocks, forming the skeleton of some portions of the Vosges, Alps, and Pyrenees, and of the great plateaux of Brittany and La Vendée, encircles the great central basin in which rises the volcanic formation of the mountains of Auvergne, with their extinct craters, lava streams, &c. The spaces between this external breast-work and its volcanic nucleus is occupied by secondary and tertiary formations. Alluvial deposits are met with in all the valleys, but they occur in extensive beds only in Alsace, in the neighbourhood of Dunkirk and Niort, and on the borders of the Mediterranean. According to M. Maurice Block's estimate, the physical and agricultural character of the soil of F. may be comprised under the following heads:

	Hectares.
Mountainous districts, heaths, and commons,	9,944,839
Rich land,	7,276,369
Chalk or lime d stricts,	9,780,197
Gravel. stony, and sandy,	15,951,018
Clay, marshy, miscellaneous,	9,807,577
	52,768,000

The same writer further subdivides the soil of F according to its actual employment; the following are some of the heads:

	Hectares.
Arable lands,	25,500,075
Meadow lands,	5,159,179
Vineyards,	2,088 048
Woods,	7,589,286
Orchards, gardens,	627,704
Olive, mulberry, and almond woods,	109,264
Chestnut woods,	559,029
Roads, streets, public walks, &c.,	1,102.122
Forests and unproductive lands,	1,047,684

Climate.—F. possesses one of the finest climates in Europe, although, owing to its great extent of area, very considerable diversities of temperature are to be met with; thus, for instance, the north-east parts of the country have a continental, and the north-west parts an oceanic climate, resembling those of Germany and Great Britain; while the Mediterranean districts are exposed at times to the ravages of the burning winds which have passed over the deserts of Africa, and to the destructive north-west wind known as the *mistral*, which often does great injury to the fields near the mouths of the Rhone and Var. The parts of F. lying south of lat. 46° have about 134 rainy days in the year, and those north of that parallel about 120. The mean annual temperature of different parts of F. has been estimated as follows by Humboldt: Toulon, 62° F.; Marseille, 59·5°; Bordeaux, 56°; Nantes, 55·2°; Paris, 51·2°; Dunkirk, 50·5°.

Products.—Of the vegetable products of F., which, from varied climatic and geognostic relations, are necessarily characterised by great abundance and diversity, the most generally cultivated are the cereals, the vine, chestnuts, olives, culinary fruits and vegetables, hops, beet-root for the manufacture of sugar, tobacco, madder, chicory, flax, &c. During the 40 years between 1819 and 1858, the supply of wheat has 22 times fallen below the demand, and 18 times risen above it. The cultivation of wheat has gradually increased during the period already referred to, but that of rye, barley, and maize has exhibited little variation; while the growth of potatoes has been most extensively augmented during the same period. The following table shews the fluctuations to which these alimentary substances have been subjected:

	EXTENT OF LAND OCCUPIED IN 1815, 1830, 1845, AND 1857.				QUANTITY YIELDED IN 1815, 1830, 1845, AND 1857.			
	1815. Hectares.	1830. Hectares.	1845. Hectares.	1857. Hectares.	1815. Hectolitres.	1830. Hectolitres.	1845. Hectolitres.	1857. Hectolitres.
By Wheat, .	4 791.677	5 011.704	5,743.135	6,639,688	39,400,971	52 782.098	71,963.280	109.589,747
" Rye, . .	2,500,000	2,500,000	2,500,000	2,000,000	25,700,000	32,440 000	30,000,000	28,500,000
" Barley. .	1,100,000	1,100,000	1,200,000	1,110,000	14,600,000	17,600,000	18,400,000	21 178,000
" Maize, . .	514,513	591,000	730 000	680,000	5 630,000	6 690 000	8,000,000	9.865,095
" Potatoes,	600,000	800,000	925 000	957,000	21,600,000	54,835,167	77,900,000	101.366.867

The mean annual yields of these productions may be estimated as follows: Wheat, 73,000,000 hectolitres;* rye, 22,000,000 hectolitres; barley, 20,000,000 hectolitres; maize, 9,100,000 hectolitres; potatoes, 95,000,000 hectolitres. This decided increase in the amount of land devoted to wheat, and the increased returns, afford evidence of the great improvement which has characterised the agriculture of F. during the last 20 years. The subdivision of farms; the short leases (of less than 18 years) on which the majority are let; and the small number of landed proprietors who reside on their own estates, have hitherto tended to check the progress of agriculture in France. The present government is, however, bestowing its careful attention on the interests of the agricultural class. Agricultural exhibitions have been held since 1850; 360,000 francs are annually given in prizes, &c.; and there are now 740 agricultural associations in different parts of France.

The manufacture of sugar from beet-root, which took its origin during the great wars of the early part of the century, has been prosecuted with much vigour during the last 30 years, and about 150 millions of kilogrammes* are annually manufactured. Since the appearance of the vine-disease, beet-root has been extensively employed in the manufacture of alcohol; and in 1857, the quantity prepared

* The hectolitre = 2·75 bushels.

* The kilogramme equals 2·2 lbs. avoirdupois.

amounted to 429,000 hectolitres. The cultivation is almost limited to the north and east; hemp and flax are grown chiefly in the northern, but also in the south-western départements. The entire production of hemp was estimated in 1842 at 67,507,076 kilogrammes, worth 86,287,300 francs; and that of flax at 36,875,400 kilogrammes, worth 57,507,400 francs. Since that period, there has been little difference in the home production, but an enormous increase in the importation of foreign flax, as the following table sets forth:

QUANTITY IMPORTED.

	Kilogrammes.	Francs.
1847,	13,811,684	17,264,605
1852,	26,580,386	33,228,480
1857,	19,770,442	25,701,885

The cultivation of the mulberry-tree derives importance from its bearing on the production of silk. In 1842, 41,275 hectares of land were planted with these trees in 38 of the départements of the west. In 1858, the département Du Gard had monopolised nearly half the culture of these trees, which in its aggregate amount has continued unchanged. From its connection with the mulberry, we here refer to the production of silk, which began at the opening of the 17th c., and which in 1790 had reached such vast dimensions, that the produce at that period was already 6½ million kilogrammes of cocoons, worth 16½ million francs. Since that period, it has exhibited great variations. From 1840 to 1853, the production continued steadily to increase from 17 to 26 millions of kilogrammes; but the diseases to which the silk-worm has been liable since that period have reduced the yield of silk to so great an extent, that in 1857 it scarcely amounted to 7 millions of cocoons.

The vine has, from a very early period, constituted one of the principal sources of the agricultural wealth of France. The choicest wines are grown in the Bordelais, Burgundy, and Champagne, but some excellent kinds are produced on the banks of the Loire, and in some of the southern départements. The cultivation of the vine increased, between 1788 and 1829, from 1,546,615 to 1,989,399 hectares; but between 1849 and 1857, it fluctuated from 2,192,939 to 2,180,096 hectares. The mean produce for every hectare was, in 1788, 21 hectolitres 21 litres; in 1829, 27 hectolitres 20 litres; in 1850, 32 hectolitres 35 litres. Since that date, however, the fungus known as the oïdium, which has attacked the vine, has inflicted such serious damage on the plant, that in 1854 (the worst year, it must be admitted) the hectare yielded only 5 hectolitres. The following table will shew some of the annual yields between the years 1808 and 1858:

PRODUCTION OF WINE.

	Hectolitres.		Hectolitres.
1808,	28,000,000	1850,	44,717,353
1829,	30,973,000	1854,	10,789,864
1848,	51,622,150	1858,	45,805,000

The average yearly produce of the vineyards of F. is estimated at 42 millions of hectolitres (about 924 millions of gallons). Of this, about ¼th is made into brandy. The mean price of the hectolitre on the spot was, in 1788, 15 francs 44 centimes; in 1810, 19 francs 90 centimes; in 1830, 16 francs 86 centimes; in 1850, 12 francs 97 centimes.

The principal forest trees are the chestnut and beech on the central mountains, the oak and cork tree in the Pyrenees, and the fir in the Landes. The destruction of the national forests has been enormous within the last two centuries, but measures have been in contemplation in recent years to plant wood, in order to protect those mountain slopes which are exposed to inundations from alpine torrents, and to provide a supply for the ever-increasing demand of wood for purposes of fuel. About ¼th of the entire territory of F. is still covered with wood. Turf taken from the marshy lands is extensively used, more especially in the rural districts, for fuel.

Animals.—F. is not so well stocked with domestic animals as her great resources might warrant us in assuming that she ought to be; but the impetus that has marked the progress of agriculture within the last 30 years has been extended to the improvement of all native breeds, and the introduction of the best foreign races. In 1812, the number of horses and mules was estimated at only two millions. In 1850, this number had risen to three millions; and it is believed that the increase has been proportionally great since that period. Asses and mules are employed as beasts of burden, but it would appear that their use is slightly on the decrease; thus, for instance, there were in F., in 1839, 373,841 mules and 413,519 asses; while according to the last census taken of these animals in 1852, and published officially in 1858, there were in that year only 327,720 mules and 398,249 asses. During the 40 years intervening from 1812 to 1852, the numbers of horned cattle have almost doubled in France. In 1852, the date of the last census, there were in F. 12,159,807 horned cattle, 33,510,531 sheep, 5,000,000 swine, 1,385,940 goats. There are, according to the *Statistique Agricole* for 1858, about 2½ millions of beehives, valued at rather more than 16½ millions of francs; the mean annual returns are, for honey, 6,670,000, and for wax, 1,620,000 kilogrammes. Poultry constitutes an important item of farm-produce in F., estimated at 40½ millions of francs; while the eggs and feathers yield 35½ millions of francs. The wild animals are fast diminishing from the soil of F., and the black and brown bear is now limited to the higher ranges of the mountains; the lynx is rarely seen, even among the higher alpine regions, but wolves are still numerous in the mountainous districts of the central départements; while the chamois and wild-goat, as well as the marmot, ermine, and hamster, are found among the Pyrenees, Alps, and Vosges. The wild-boar, roebuck, fox, squirrel, polecat, and marten are to be met with in the woods. The red and fallow deer are scarce; hares and rabbits abound, and game generally is plentiful. The wanton destruction of small (singing) birds having been found to be conducive to the excessive increase of noxious insects, stringent municipal enactments have been issued within the last year for the protection of those birds.

Fisheries.—The French government expends between three and four millions of francs annually in aiding those engaged in the great fisheries; and in 1858, 525 vessels, with 67,929 tonnage, and 12,530 men, were engaged in the whale and cod fisheries. According to official reports, 15,500 persons are employed in preparing and salting fish. In 1858, the imports of fish amounted to 21½ and the exports to 12 millions of francs. Of these, cod constituted the principal item. There are no official reports of river and other fresh-water fishing in F., or of the minor fisheries carried on along the coasts, although the latter constitute the principal means of occupation and support of the majority of the population in the maritime départements. Pilchards and mackerel are caught in large quantities off Normandy and Brittany. The west coasts have extensive oyster and mussel beds; tunnies and anchovies are caught on the shores of the Mediterranean.

Mineral Products.—The chief mineral products of F. are coal and iron, in the excavation of which 179,825 men were employed in 1850. Although F.

ich in coal, it possesses several very con- coal-beds, which are situated principally ast-south-east and north. In 1852, 448 es had been opened (of which only 286 were tion), having a square area of 4776 kilo- The supply hitherto has not equalled the and in 1858, F. imported from the German ation, Belgium, and England, 45¼ millions ls* of coal. The entire consumption in 1852 millions of quintals. The iron mines of excellent quality, but their distance from necessary for the working of the mineral, them of relatively small value. In 1847, ere 101 mines in operation, from which ions of quintals were taken; more than his quantity being obtained from the five ients of Haute-Marne, Haute-Saône, Cher, and Nord. The political disturbances of l a very depressing effect on all branches lurgical industry, which has scarcely been at the present time. F. imports iron itzerland, Germany, Belgium, and Eng- rgentiferous galena, a little silver and gold, ead, manganese, antimony, and tin occur, certo their working has not proved very ve. The département of Charente-Inférieure e largest amount of salt, the mean annual being 1½ millions of quintals (2¼ millions), which is fully one-third of the entire roduce of the whole country. F. derives l millions of francs from its quarries of and freestone, its kaolin, marbles, sands, hic stones, millstones, &c. Granite and re found in the Alps, Vosges, Corsica, Nor- nd Burgundy; porphyry in the Vosges, and d lava for pavements in the mountains of e. Marble is met with in more than 40 ients; alabaster occurs in the Pyrenees; the late-quarries are situated near Cherbourg d.

llowing list gives an approximative esti- the value of the chief products of French :

	Francs.
t, cotton, wool, silk,	3,000,000,000
ries, laces, embroideries, articles of	1,800,000,000
rries, iron, and other mineral works,	711,600,000
watches, clocks,	200,000,000
ls—as sugar, &c.,	364,500,000
ber, oils,	356,250,000
s, isinglass, &c.,	80,000,000
roducts,	80,000,000
ts,	86,000,000
ning,	60,000,000
heries,	98,000,000
Total,	6,986,350,000

incipal seats of industry are as follows: For brics, the départements Le Nord, La Sarthe, -Loire, Seine-Inférieure, Le Calvados, Seine- Ille-et-Vilaine, &c.; employing (in 1852) workmen, 1004 steam-engines, 305,968 looms, 4,839 shuttles. F. stands unrivalled for her nufactories, the finest of which are at Lyon, nd Paris. The département La Loire, and ecially the manufactory of St Etienne, is the eat of the ribbon trade. Alençon, Bailleul ing the so-called *Valenciennes*), Lille, Arras, nd Bayeux, are all famous for their laces ales, which alone occupy 250,000 persons. stands conspicuous for its *merinos* and fine ; Amiens and Alsace for their fine printed goods; Lodève and Elbeuf for army cloths. are made at Grenoble, Paris, &c. The best are made at Aubusson, Abbeville, and Paris is the seat of industry for some of the most costly fabrics, as Gobelins Tapestry, shawls of great value, watches, clocks, articles of *vertu*, carriages, philosophical instruments, &c. Sèvres stands unrivalled for its china and glass. St Gobain and St Quirin manufacture looking-glasses of the largest size.

The trade of F. is inferior only to that of England and the United States, and her favourable position in having the command of the three most important maritime thoroughfares in the world, would seem to place the future supremacy of commerce within her reach. The great emporiums of trade are Paris, Lyon, St Etienne, Lille, Rheims, Mülhausen, Nimes, Toulouse, St Quentin, Orleans, Avignon, Montpellier, &c.; and the most active maritime ports are Marseille, Cette, Havre, Bordeaux, Nantes, Rouen, Calais, Dunkirk, Boulogne, Dieppe, &c. These centres of trade have all suffered at different periods during the present century, from the political disturbances under successive governments; but notwithstanding these drawbacks, the commercial activity of the country has made rapid strides within the last 30 years. The following table shews the condition of trade during four years of the old monarchy, when, however, it must be remembered that one-third of the entire trade was composed of exchanges with the colonies:

Years.	Value of Importations in millions of francs.	Value of Exports in millions of francs.	Total.
1787,	551	440	991
1788,	517	466	983
1789,	577	441	1018
1792,	929	803	1732

While the rate of this progress during five years preceding 1859 has been as follows:

Years.	Importations in millions of francs.	Exportations in millions of francs.	Total.
1854,	2867	3049	5916
1855,	3318	3469	6787
1856,	3788	3947	7735
1857,	3696	3987	7683
1858,	3419	4219	7638

The ships employed in the import trade are about 30,000 (3¼ million tons), and those in the export trade, 26,000 ships (2¼ million tons). The transit trade of F. is effected by maritime navigation between foreign and French ports, by coasting traffic, or *cabotage*, between various French ports, and by railways. The merchant navy, which has increased extensively of late years, numbered, in 1858, 19,805 vessels, having a tonnage of 2,987,000; of the latter number, 324 were steamers, and 15,187 were vessels carrying both sails and engines. The *cabotage*, or internal and coasting traffic, is a great source of financial wealth to the state, to which all rivers and canals belong. There is a length of 13,155 kilomètres available for inland navigation in France, but, according to an official report of 1860, three-fourths of the entire traffic is concentrated upon 1800 kilomètres of this length. In the year 1857, 51,522,492 tons (of 1000 kilogrammes the ton) of goods were conveyed by this inland water communication in 95,274 boats, with 3,389,983 tons, and employing about 500,000 men. Of this number, 73 per cent. belonged to the ocean ports, and 27 per cent. to the Mediterranean.

According to the latest official report, the railways in operation measure 9100 kilomètres; and those in contemplation 7000 kilomètres; making a total length of about 10,000 miles. The cost of all the lines up to 1858 was 3,669,433,780 francs, more than one-third of which was expended from 1855 to 1857. The total receipts of all the lines were, for 1858, 334,769,469 francs; for 1859, 387,562,239 francs. The total number of passengers conveyed

* The quintal equals 1·97 cwt.

by rail in 1857 was 37,952,398. Of every 100 of these, 10 were by first class; 20 by second class; and 70 by third class. The mean cost is 6 centimes the kilomètre, or about 10 centimes the mile. The creation of the first high-roads in F. is referred to Philippe Auguste; and their more perfect organisation in the 16th and 17th centuries, to Henry IV. and Louis XIV. Under Napoleon, there were 125 high-roads, extending in all over 31,814 kilomètres; and in 1859 there were 655 imperial roads (36,150 kilom.), 265,000 departemental roads (1,228,000 kilom.), with 2000 bridges, and a length of 1500 kilomètres.

Postal Service.—The postal service in F. goes back to the year 1464, when Louis XI. placed it on a systematic footing, under the direction of the state. Since 1848, a uniform rate of postage of 20 centimes has been fixed for all letters for F. and Algiers, independently of distance. In 1859, there were 217,555,450 stamps sold, which brought a return of 40,000,000 of francs. The whole receipt of the postal service is nearly 60,000,000 of francs.

Electric Telegraph.—The first electric telegraph was constructed in F. in 1844, and F. is now intersected by a close net-work of wires, which flash communications between Paris, as the central focus, and every part of the empire. In 1859, the lines measured 13,030 kilomètres, and the profits realised were 3½ millions of francs.

Constitution, Administration, &c.—The imperial government was re-established in F. by a *senatus-consultum* in 1852, ratified by the popular vote or *plebiscitum*. The imperial dignity was, by virtue of the same acts, conferred upon Louis Napoleon Bonaparte, who bears the title of Napoleon III., Emperor of the French. The political organisation of the empire was regulated by the constitution of the 14th of January 1852, which decreed that the emperor should govern with the aid of ministers, a council of state, a senate, and a legislative body; and that the powers wielded by these several bodies should be both legislative and executive; the former to be exercised collectively by the emperor, senate, and legislative chamber; and the latter to be vested exclusively in the hands of the emperor, and by him delegated to administrative and judiciary officers. The emperor is the chief of the state, he commands the naval and military forces, declares war, and settles treaties of peace, alliance, and commerce. He nominates to all employments; justice is administered in his name, and he has the right of granting pardons and amnesties. According to article 6 of the constitution of 1852, 'the emperor is alone responsible to the French people, to whom he has at all times the right to appeal.' The ministers depend only upon him, and each has merely a limited responsibility in regard to his own department. All public officers, from the chief ministers to the lower functionaries, tender an oath of fidelity to the emperor. The civil list is to be fixed at the commencement of every reign; and, according to the decree of January 19, 1853, the emperor is to receive 25,000,000 of francs annually, and the princes and princesses of the imperial family 2,500,000 francs each. The imperial dignity is hereditary in the male descendants of the emperor; and in default of these, in the male line of descent from the brothers of the Emperor Napoleon I. The senate is composed of cardinals, marshals, and admirals, chosen for life by the emperor. Their number is limited to 150, and they receive each an annual allowance of 30,000 francs. The meetings of the senate are not public, and they are convoked and prorogued at the emperor's will. No law can come into force till it has been ratified by the senate; and in the event of the dissolution of the legislative chamber, it rests with this body to provide for the proper administration of public affairs. The deputies of the legislative chamber are elected by universal suffrage, the votes being taken without public scrutiny, and without any open examination of the lists of voters. They are elected for six years, and receive 2500 francs a month pending the sessions. The emperor convokes, prorogues, and dissolves the chamber, but the constitution requires that in case of its dissolution, a new chamber shall be convoked within six months. The number of the deputies fluctuates with the population, each département with 35,000 inhabitants having one deputy; or two deputies where there is an excess of 7500 over the required 35,000. The total number has been fixed for 1857—1862 at 267. The *council of state* is composed of the emperor and the members of his family, a president and a vice-president, and about 150 councillors, auditors, &c., all named by him. It is a mixed justiciary and administrative body, acting as a court of appeal and ultimate decision from other branches of the legislature. There are ten ministers of state named by the emperor, who dismisses them at his pleasure. These ministers preside over the several departments or bureaus into which the government has been divided, and are responsible to the emperor alone.

Départements, &c.—Inclusive of the newly acquired territory, F. is divided into 89 *départements*, comprising 373 *arrondissements*, 2938 *cantons*, and 37,510 *communes*. Each département is presided over by a préfet, nominated by the emperor on the presentation of the minister of the interior; each arrondissement by a sub-préfet; each canton by a member at the general council of the département which meets annually for whatever period the emperor may decree; and every commune has its *maire* and municipal council. Every chief town of a canton has its commissary of police; in the larger towns, there must be one of these officers to every 10,000 inhabitants. The administration of justice is presided over by a special minister of state, who is keeper of the seals. A supreme tribunal serves as a court of appeal from the lower courts. The tribunals of commerce and police, together with those of the several départements, take cognizance of the various civil and criminal cases specially falling within their several spheres. There are 361 tribunals of the arrondissements, or *tribunaux de première instance*, which are divided into six classes; 2681 police courts; 218 tribunals of commerce; 27 imperial courts, divided into four classes; a *Cour de Cassation*, divided into three chambers, which confirms or annuls the sentences of the police and assize courts; and a *Haute Cour de Justice*, which gives final judgment in all cases of *lez-majesté*, or other offences against the state. Assizes are held every three months in 59 towns; and, independently of the ordinary judicial magistrates, the courts of assize are composed of juries of twelve men, chosen in accordance with certain prescribed regulations. In the maritime and commercial towns there are also councils of *prud'hommes* (experienced men), with summary jurisdiction in matters to the amount of 100 francs. These councils, which are composed of master-workmen elected annually, decide several thousand cases in the year in the larger cities. There were 9712 notaries in practice in F. in 1857. The state is charged 28½ millions of francs annually for the expenses incident to the ministry of justice. There are 387 départemental prisons, 21 central houses of detention, 2 political prisons at Doullens and Belleisle, and numerous penitentiaries and reformatories for the young. All these prisons, excepting the two for political offenders,

are in part self-supporting. The three hulks or *bagnes* of Brest, Rochefort, and Toulon contained, in 1859, only 2700 convicts, and it was determined by a decree issued in 1852, that they were to be ultimately broken up, and that the prisoners were for the future to undergo their sentence in French Guyana (q. v.).

Religion, Churches.—The principle proclaimed in 1789, 'that no person can be molested in F. on account of his religious opinions,' provided the manifestation of them does not disturb the public peace as established by law,' has been confirmed by the constitution of 1852. The public exercise of any special form of religion must, however, be preceded by the official authorisation of the préfet, or in special cases, by that of the emperor in council. The *recognised* forms of faith are—the Roman Catholic, the Protestant (including the Reformed and Lutheran), the Jewish, and, for Algiers, the Mohammedan. The clergy attached to these religions receive their pay from the state, and are exempt from military service. The Roman Catholic church embraces the great majority of the people. Of the 37,000,000 which constitute the present population of F., 1,500,000 appertain to the two Protestant churches, 150,000 to the Jewish persuasion; and 25,000 to non-recognised but tolerated denominations, the Anabaptists comprising nearly one-third of this number.

At the breaking out of the Revolution, the annual revenues of the church amounted to 150,000,000 of livres, and its debts to 133,000,000. The state appropriated to itself the funds of the church in 1789, and assumed the responsibility of maintaining public worship. The following table gives a summary of the expenses incurred by the state for the maintenance of religion since the Consulate.

Years.	Catholic Religion.	Protestant Church.	Jewish form of Faith.	Mohamm. Rel. in Algiers
	Francs.	Francs.	Francs.	Francs.
1803, . .	4.059,006	22.362		
1813, . .	16 62· 8·8	6 5 000		
1823, . .	26 138 415	577.829		
1835, . .	33 5.3 819	849 763	79.935	3,000
1847, . .	37 630,008	1.240 229	108,836	3,000
1854, . .	42 225,321	1.328,891	149.428	568 024
1862, . .	44 791,100	1,408,436	189,400	850.200

The archbishops and bishops of the church of F. are nominated by the emperor, and canonically inducted by the pope. There are 16 archbishops and 65 bishops. The Archbishop of Paris receives 50,000 francs per annum; the other archbishops, 20,000 francs: the bishops, 15,000 francs. Six French prelates hold the rank of cardinals, to which dignity they are nominated by the pope on the presentation of the emperor. Every archbishopric has 3, and every bishopric 2, vicars-general, the whole number being 177. Their salaries vary from 3500 to 4500 francs. There are 669 canons belonging to the various cathedral chapters, receiving from 1600 to 2400 francs per annum; and there is a special chapter at St Denis, instituted to have charge of the graves of the ancient kings of F., and intended, moreover, to serve as a retreat for ecclesiastics renowned for learning or science. There are at present 3424 *curés* or parochial beneficed clergy, who are canonically inducted by the bishops, under the approval of the state; and 29,971 curates or assistants. The *curés* receive from 1200 to 1500 francs; the curates, 200 francs. The *curés* may be assisted by a certain number of vicariats, who receive from 350 to 500 francs; there are at present 8050 authorised by the state. There are 36 large, and 130 smaller seminaries, for the education of the clergy, with 27,290 pupils. There are also 22 establishments maintained by the state for the education of nuns and sisters of charity. It is computed that the number of men and women who lead a cloistered life is as great now as before 1792. There are in F. 105 Reformed consistories, and 44 belonging to the Lutheran Church. The central council of the reformed churches holds its sittings at Paris. Synods composed of the delegates of five churches may assemble with the authority of the state to regulate the celebration of the services of their church; but their meetings cannot last longer than six days, and their decisions must be submitted for the approbation of the government. There are two Protestant seminaries, one for Lutherans at Strasbourg, and the other for the Reformed at Montauban.

Public Instruction.—Public instruction is presided over in F. by a special ministry. Nearly half the expenses connected with it are defrayed by the state, and the remainder by the départements. There are 16 academies located in the following towns—Aix, Besançon, Bordeaux, Caen, Clermont, Dijon, Douai, Grenoble, Lyon, Montpellier, Nancy, Paris, Poitiers, Rennes, Strasbourg, Toulon. These academies are divided into the five faculties of theology, law, medicine, sciences, and literature, and supplemented by various superior and preparatory schools. The professors are paid partly by the state, and partly by fees. There are superior normal schools intended to train teachers for the higher departments of instruction. Secondary instruction has received an immense impetus during the present century. There are 69 normal schools for teachers of public and primary schools. The number of primary communal schools for boys has also increased in a remarkable degree since the Revolution of 1830. In 1833, there were 22,640 primary public schools; in 1857, 36,500; besides which there were 3500 *free* primary schools for boys. Of the above 36,500, 18,000 were mixed schools admitting girls. There were, moreover, 11,500 free schools for girls, and 14,000 communal schools for their use, more than half of which are under the management of religious sisterhoods. In 1857, about one-fifth of the entire number of boys, and one-fourth of the girls, between the ages of seven and thirteen, received no primary education. The different départements share very unequally in the diffusion of education, and it may be generally observed that the proportion of the educated is highest in the central and western départements, and lowest in the eastern départements, on the German frontier line. F. supports numerous colleges and schools for instruction in special branches of knowledge: as L'Ecole des Chartes; des Langues Orientales; des Beaux-Arts, founded in 1671 by Louis XIV.; de Dessin, founded in 1766 by Louis XV.; the Conservatoire de Musique, founded in 1784; L'Ecole de Rome, founded by Louis XIV., and L'Ecole d'Athènes, founded in 1846; L'Ecole des Ponts et Chaussées, for the instruction of engineers of public works; L'Ecole des Mines (1783); the Conservatoire Impérial des Arts et Métiers, for the application of science to the arts and trades; the central school, des Arts et Métiers; and the imperial schools for arts and trades, designed to give superior instruction to handicraftsmen in their own special branches of industry. There are, moreover, numerous agricultural, forest, farming, and veterinary schools, besides the Ecole Polytechnique, specially designed to prepare youths for the public services; and lastly, the military and naval colleges at St Cyr, Saumur, Paris, Vincennes, Brest, Toulon, and St Denis.

Literary and Scientific Institutions.—Among the literary and scientific institutions of F., the first is L'Institut de France (q. v.). The Museum of

Natural History, known formerly as the Jardin du Roi, is one of the finest in the world. The Bureau des Longitudes and the Observatoire, at Paris and Marseille, have occupied the first rank among scientific institutions since their foundation. These establishments are all maintained at the cost of the state. Paris possesses several libraries belonging to and supported by the state, but freely opened to the public. The most important of all is that now known as La Bibliothèque Impériale. See LIBRARIES. There are 338 public libraries in the provinces, to all of which access is afforded in the most liberal spirit. F. is rich in public galleries of painting, statuary, and articles of *vertu*. The Musée du Louvre, Musée de Versailles, and du Luxembourg at Paris, are rich in the possession of some of the greatest gems of art still existing.

Theatres.—The theatre, like all other public institutions, is under the surveillance of the state, which charges the annual budget for the maintenance of theatrical companies. There are twenty-two licensed theatres in Paris, and fifty in the provinces, besides numerous itinerant troupes. The opera alone receives 820,000 francs from government, and the other Parisian theatres about 600,000 francs. Since 1850, all dramatic works have been again subjected to the control of the censor.

Press.—The press is also under the same censorial restrictions, and every printer and bookseller must furnish guarantees of character, &c., before he can print or publish any paper or book. From 1851 to 1858 inclusive, there were 77,650 books and pamphlets printed in F.; there are at present 263 political, and 1100 non-political journals printed, nearly one-half of which are issued in the département of the Seine.

Charitable Institutions.—F. is rich in institutions of charity, many of which are remnants of the old system of church relief; but the *crèches*, of which there are several hundred, and which are, in fact, free nurseries, where working-mothers may leave their young children during their hours of labour, are a modern form of charity, which originated (in 1844) with M. Marbeau at Paris. There were, in 1853, 1324 hospitals and infirmaries maintained by the proceeds of landed and funded property, a percentage on the receipts at theatres and other places of amusement, and by the government and the several local communes. These 1324 hospitals and infirmaries had 69,000 beds, of which 58,000 were free. Public charities for the relief of paupers derive their resources either from the state or the départements, or from municipal funds, and are administered by the *bureaux de bienfaisance*, of which there were, according to the latest report, 11,409, relieving 110,000 persons annually; by the *dépôts de mendicité*; and by numerous other local institutions.

Taxation, Finances.—The public revenues are obtained in F. from direct and indirect taxation, and the proceeds derived from state lands, &c. The following table shews the financial report of the public receipts and expenditure for different years from 1815 to 1859:

Years.	Receipts = francs.	Expenditure = francs.
1815, ...	743,830,200	798,590,859
1824, ...	994,971,962	992 583 233
1830, ...	1.031.796.054	1.095 112,115
1835, ...	1,038,102.801	1,047 207,680
1840, ...	1,234.483 099	1.363.711,102
1845, ...	1,393.286.845	1.489,432,101
1850, ...	1.421 622.471	1.472 537,238
1855, ...	2,793 273.965	2.399.217 840
1857, ...	1,799.225,838	1,872.526.217
1859, ...	1,766,080 877	1,773,919,114

Public Debt.—The following table shews the fluctuations which the interest on the national debt, including dotations charged to the civil list, has undergone at various periods from 1830 to 1860:

Years.	Francs.	Years.	Francs.
1830, . . .	349,935,534	1852, . . .	415,332,776
1835, . . .	344,015 052	1854, . . .	434.241,567
1840, . . .	352,966.196	1856, . .	550.769,522
1845, . . .	343,938,729	1858, . . .	562,478.136
1850, . . .	398,088,890	1860, . . .	602,128,070

The public debt has been greatly increased in consequence of the imperial government having raised enormous loans within the last five or six years. The necessities of the war in the Crimea led to the authorisation of three loans—the first for 250, the second for 500, and the third for 750 millions of francs in 1855. These loans were effected by public subscriptions, furnished in response to the appeal made by the emperor to the nation at large. Subscriptions of ten francs or multiples of ten francs were received, and so successful was the appeal, that 600,000 persons pressed forward with tenders to the value of 4740 millions of francs, which had to be reduced more than two-thirds. In 1859, a new loan of 500 millions of francs was effected on the same principle. At the present date (1862), the floating debt, including the interest on these loans, amounts to 920 millions; while the capital of the consolidated debt represents a value of 8600 millions of francs.

Army.—Standing armies date in F. from the time of Charles VII. The law of 1832 regulated the system of recruiting by conscription, on the footing which, with few modifications, it has subsequently occupied. The annual contingent, which since 1856 has been fixed by law at 100,000 men, is made up year by year by the drawing of lots in each commune among the young men whose names are on the rolls as eligible for service. The standard of height (1860) is 1 mètre 56 cent. (about 5 feet 1 inch), which is 2 cent. less than that required under Napoleon. Exemption from service may be obtained by the payment of a certain fine. Prior to the Revolution of 1789, the army when on a footing of peace amounted to 256,051 men, maintained at an annual cost of 125 millions of francs. At the beginning of the Empire in 1808, the army consisted of 450,000 men, and cost the nation 350 million francs; and the budget proposed for 1862 gives 400,000 men as the effective force to be maintained. Besides regular troops, F. has its *Garde Nationale*, which was created in 1789, and legally organised in 1791. Since 1852, the sphere of its obligations has been limited to the maintenance of order in case of threatened insurrection.

Navy.—The French navy has been very materially strengthened and augmented during the last ten years; and the extensive augmentations meditated in 1858 in this branch of the service will, it is calculated, bring the navy estimates year by year till 1872 (when it is contemplated that the works begun in 1857 will be completed) to 123 millions francs. The inscription for the navy, which owed its systematic organisation to the great minister Colbert (1681), is regulated by various ordinances, the last of which bears the date of 1852. All persons engaged in any maritime avocation between the ages of 18 and 50 are liable to inscription, but the service is only compulsory for three years. There are 170,000 names on the rolls. Of these, 38,375 are on service during peace; in time of war, 60,000 may be called out. The fleet consists of 600 vessels afloat, or under transformation, carrying 13,353 guns; of these, 373 are steamers. There are 22,400 marines in peace, 26,879 in war, and 25,500 customs and coastguards men. F. has 6 dépôts for marine artillery, 3 foundries, and 2 manufactures for

les. There are special hospitals, schools, and s for the use of the navy.

y, *Weights, and Measures.*—For the money, , and measures now used in F. see FRANC, LITRE, GRAMME.

rs and the French Colonies.—As Algiers according to the constitution of 1852, is olony, but an integral part of F.) has been treated of in a separate article, we will only recapitulate some few of the most important in regard to its administrative and industrial on. Since 1858, the direction of affairs in has been vested in a special ministry. The rovinces of Algiers, Oran, and Constantine livided into civil territories or départements e head of each of which is a préfet, and a of préfecture—and into military territories, which is commanded by a general of , assisted by a special council. The adminis- of the law is conducted in accordance with tem established in the rest of the empire, ig that there are in Algiers certain Mussul- urts, composed of *cadis* and *medjlès*, which gnizance of civil and commercial actions natives. In 1859, the receipts of the state 0,500,000 francs; in the same year, the s of the state were 18,000,000 francs, leaving s of 2,500,000 francs.

rs has proved a most efficient training- for the French army, and almost every t has in turn been stationed there. The number of troops in the country, when no warlike demonstration on the part of ugated chiefs, is as follows: Officers, about en, about 78,000); in all, 81,700; and about orses. There are on an average 550 gen- (109 brigades); 225 commissaries and agents e; and 430 custom-house, coastguard, and rotective officials. There are between 400) schools, including primary and secondary ion, at which 27,000 children attend. The are principally members of religious orders. ncipal raw products are tobacco, of which 0 kilogrammes were sent to F. in 1858; of which considerable quantities are exported years to Spain, &c.; the latter crops are, , uncertain. Silk and cotton are being sd, but not as yet with any great success; tares were devoted to the growth of cotton . Coral was formerly found in large quan- f the coasts of Algiers, and after various ions, the produce of the year is now about kilogrammes (4,250,000 francs). In 1857, ere 150 vessels, chiefly Italian, engaged in ade. There is a bank established with ent securities at Algiers, which has branches rovinces.

dministration of the French colonies has, 858, been placed under the ministry of e and colonial affairs, assisted by a consult- mittee composed of four members, nomi- y the emperor, and one delegate from each olonies of La Martinique, Guadeloupe, and (q. v.), elected for three years. In the olonies, the administrative power is vested ernor, who exercises supreme military com- nd is assisted by a general council, specially to vote the budget of the province. Three act under the orders of the governor—viz, lonnator,' director of the interior, and pro- general. There is also in each colony a controller, who presides over the financial r departments of general administration.

ard to the minor machinery of government, nies are organised on the model of the country. There is at Paris a dépôt for colonial archives, in which copies of all registers acts, and judgments referring to the various colonies, are open to inspection.

The state contributes 1,000,000 francs annually for the maintenance of Christian worship in the colonies, and 220,000 towards public instruction, which is partly gratuitous, and chiefly conducted by the clergy. Sugar, and coffee, and cotton constitute the principal sources of French colonial wealth. Slavery was virtually abolished in 1848, when it was decreed that no Frenchman, under penalty of forfeiting his rights as a French citizen, must own slaves in any country after a term of three years from that date. This term was afterwards extended to ten years, and expired in 1858. An indemnity of 126,000,000 francs has been paid to the French colonists for the enfranchisement of their slaves. See *Statistique génér. méthodiq. et compl. de la France*, by J. H. Schnitzler; *Dictions. et Annuaires de l'Administ. Franc.*; Dareste de la Chavaune, *Hist. des Class. Agricol. en France* (1858); Lejeun, *Géolog. de la France* (1858); *Statist. de la France* (M. Block, 1860); Lavergne, *Econom. Rurale* (1861); *Atlas Universel* (Babinet); *Géogr. de la France* (Oger).

History.—Gallia (Eng. *Gaul*) was the ancient name under which F. was designated by the Romans, who knew little of the country till the time of Cæsar, when it was occupied by the three races of the Aquitani, Celtæ, and Belgæ, who respectively inhabited the south-west, the west and central, and the north and north-east parts. There were also some tribes of Germans, Ligurians, and Greeks. It is probable that the Celts were the oldest race, for this people had sent forth colonies into Italy 600 B.C. The Greeks never penetrated far beyond the shores of the Mediterranean, where they planted colonies, the most important of which was Massalia (Marseille). The conquests of Cæsar reduced a great part of the country. Under Augustus, Gaul was divided into four provinces, which, under subsequent emperors, were dismembered, and subdivided into seventeen. In the decline of the Roman power, Gaul was ravaged by neighbouring hordes, and in the 5th c. it fell completely under the power of the Visigoths, Burgundians, and Franks. In 486 A.D., Clovis, a chief of the Salian Franks, and of the race of Merovingius, raised himself to supreme power in the north. His dynasty, known as the Merovingian, ended in the person of Childeric III., who was deposed, 752 A.D., after the kingly power had already passed into the hands of the former Maire du Palais, or mayor of the palace, Pepin d'Heristal, and, after him, into those of Charles Martel and Pepin le Bref. The accession of Pepin gave new vigour to the Frankish monarchy which, under his son and successor Charlemagne (768—814), rose to the rank of the most powerful empire of the West. Christianity, civilisation, and letters were protected during his reign, and before his death he had joined the crown of Lombardy to his other diadems, and had stretched the limits of his empire from the Eider and the German Ocean to the Ebro and the Mediterranean, and from the Atlantic to the Baltic. With him, however, this vast fabric of power crumbled to pieces, and his weak descendants completed the ruin of the Frankish empire by the dismemberment of its various parts among the younger branches of the Carlovingian family. Intestine wars desolated the land, and foreign assailants threatened it on every side. In 911 A.D., the ravages of the Northmen had assumed so persistent a character, that Charles le Simple was glad to purchase immunity from their encroachments by the cession

of the territory subsequently known as Normandy. Anarchy reigned paramount; the various governors established an hereditary authority in their several governments, and the crown was by degrees deprived of the noblest part of its appanages. The power of some of the vassals surpassed that of the kings; and on the death of Louis V. the Carlovingian dynasty was replaced by that of Hugues, Count of Paris, whose son, Hugues Capet, was elected king by the army, and consecrated at Rheims, 987 A. D. At this period, the greater part of F. was held by almost independent lords, and the authority of the Capetian kings extended little beyond Paris and Orleans. Louis le Gros (1108—1137) was the first of the race who reinstated order. He promoted the establishment of the feudal system, abolished serfdom on his own estates, secured corporate rights to the cities under his jurisdiction, and gave efficiency to the central authority of the crown. A greater degree of general order was thus secured, while a new element in the state was generated by the foundation of a free burgher class. Louis carried on a war against Henry I. of England; and when the latter allied himself with the Emperor Henry V. of Germany against F., he brought into the field an army of 200,000 men, whose ready appearance afforded the first instance of the existence of a common national feeling of patriotism, ready to respond to the appeal of the sovereign. The *oriflamme* is said to have been borne aloft for the first time on this occasion as the national standard. Louis VII. (*Le Jeune*), who took part in the second crusade (1137—1180), was almost incessantly engaged in war with Henry II. of England. His son and successor, Philippe Auguste (1180—1223) recovered Normandy, Maine, Touraine, and Poitou from John of England, and increased the power of the crown in various other parts of France. He took an active personal share in the Crusades, and permitted the pope to organise a cruel persecution against the Albigenses in the southern parts of the country. Philippe was the first to levy a tax for the maintenance of a standing army, and in his reign a chamber of peers, of six secular and six ecclesiastical members, was instituted, to act as a council of state. Many noble institutions date their origin from this reign, as the university of Paris, the Louvre, &c. By the amendment of the administration of justice, the right of appeal to the royal courts was established, and the arbitrary power of the great vassals crippled. Improvements in the mode of administering the law were continued under his son, Louis VIII. (1223—1226), and his grandson, Louis IX. (1226—1270), who caused a code of laws (*Etablissements de St Louis*) to be promulgated. St Louis also effected many modifications in the fiscal department, and, before his departure for the Crusades, secured the rights of the Gallican Church by a special statute, in order to counteract the constantly increasing assumptions of the papal power. Under his son, Philippe III. (1270—1285), titles of nobility were first conferred by letters-patent. He added Valois and the *comtés* of Toulouse and Venaissin to the crown. Philippe IV. (1285—1314), surnamed *Le Bel*, acquired Navarre, Champagne, and Brie by marriage. With a view of securing support against the secular and ecclesiastical nobility, with whom he was constantly at war, Philippe gave prominence to the burgher element in the nation, and on 28th March 1302, he, for the first time, called together the *états généraux*, or general estates, at which the *tiers état*, or burgher class, appeared together with the nobles and clergy. These changes were, however, accompanied by arbitrary innovations in the fiscal and other departments of the government, which were effected with reckless haste and violence. With a view of securing to the crown the great fiefs, he abrogated the right of females to succeed to landed property. His tyrannical persecution of the Templars shewed the extent to which the regal power could be stretched; and under his successors, Louis X. (1314—1316), Philippe V. (1316—1321), and Charles IV. (*Le Bel*), (1321—1328), the last direct descendant of the Capetian line, the rule of the kings of F. became even more unlimited, whilst the court was given up to every species of luxurious indulgence known to the age. Philippe VI., the first of the House of Valois (1328—1350), a distant relative of Charles IV., and the nephew of Philippe IV., succeeded in right of the salic law. His reign, and those of his successors, Jean (1350—1364) and Charles V. (*Le Sage*), (1364—1380), were disturbed by constant wars with Edward III. of England, who laid claim to the throne in right of his mother, a daughter of Philippe le Bel. The war began in 1339; in 1346, the battle of Crécy was fought; at the battle of Poitiers (1356), Jean was made captive; and before its final close after the death of Edward (1377), the state was reduced to bankruptcy, the nobility excited to rebellion, and the mass of the people sunk in barbarism. Falsification of the coinage, onerous taxation, and arbitrary conscriptions, brought the country to the verge of irretrievable ruin, while the victories of England humbled the sovereign, annihilated the French armies, and cut down the flower of the nation. The long and weak minority of Richard II. diverted the English from the prosecution of their groundless claims to the kingdom of F., which revived somewhat from the effect of its long and disastrous warfare; but during the regency for the minor, Charles VI. (*Le Bien Aimé*), (1380—1422), the war was renewed with increased vigour on the part of the English nation, who were stimulated by the daring valour of Henry V. The signal victory won by the English at Azincourt in 1415; the treason and rebellion of the French princes of the blood, who governed the larger provinces; the ambition of the several regents, the ultimate imbecility of the king, the profligacy of his queen, and the love of pleasure early evinced by the dauphin, all combined to aid Henry in his attempts upon the throne, and at one period his recognition as heir to the crown, and the disorganised state of the nation, seemed to threaten the complete ruin of F.; but the premature death of Henry, the persevering spirit of the people, and the extraordinary influence exercised over her countrymen by the Maid of Orleans, Jeanne d'Arc, who instilled courage into the hearts of the soldiers, and roused the dauphin from his lethargic indolence, combined to bring about a thorough reaction, and, after a period of murder, rapine, and anarchy, Charles VII. (*Le Victorieux*), (1422—1461) was crowned at Rheims. He obtained from the Estates General a regular tax (*taille*) for the maintenance of paid soldiers, to keep in check the mercenaries and marauders who pillaged the country. The policy of his successor, Louis XI. (1461—1483), the first king entitled 'His most Christian Majesty,' favoured the burgher and trading classes at the expense of the nobles, while he humbled the power of the crown-princes. He was a crafty ruler, who managed the finances well, and succeeded, by policy and good-luck, in recovering for the crown the territories of Maine, Anjou, and Provence; while he made himself master of some portions of the territories of Charles the Bold, Duke of Burgundy. Charles VIII. (1483—1498), by his marriage with Anne of Brittany, secured that powerful state, and consolidated the increasing power of the crown. With him ended the direct male succession of the House of Valois. Louis XII. (1498—1515),

e du Peuple) was the only representative of the *Orleans* family. The tendency of his reign confirm the regal supremacy, while the condition of the people was ameliorated. He s successor, Francis I. (1515–1547), of the *Angoulême* branch, wasted their resources in ttempts to establish their hereditary claims hardy, and were thus perpetually embroiled ıe House of Austria. A *concordat* with the gned in 1516, secured the nomination of the n bishops to the king. In this reign, the ly of Notables and Deputies superseded the l Estates. The defeat of Francis at the f Pavia, in 1525, and his subsequent imprison- ; Madrid, threw the affairs of the nation into atest disorder, and embarrassed the public s to a most ruinous extent. Arts and litera- re encouraged in this reign, and in that of eeding monarch, Henri II. (1547—1559), who ed the disastrous Italian war. In the latter egan the persecutions of the Protestants, were carried on with still greater cruelty Henri's three sons, Francis II. (1559—1560), IX. (1560–1574), and Henri III. (1574— he last of this branch of the *Valois*. The e of St Bartholomew (1572) was perpetrated he direction of the queen-mother, Catharine lici, and the confederation of the League, at d of which were the Guises. The wars of ague, which were carried on by the latter the Bourbon branches of the princes of the yal, involved the whole nation in their

The succession of Henri IV. of Navarre 1610), a Bourbon prince, descended from ger son of St Louis, allayed the fury of these s wars, but his recantation of Protestantism ır of Catholicism, disappointed his own party. ly part of his reign was perpetually disturbed nutinies of the troops and the rebellions of les. By degrees, however, Henri, through ıte counsels of his minister Sully, and by his rsonal popularity, raised the power of the ıigher than ever, while he began a system of h administrative reform, which was only l by his assassination by the fanatic Ravaillac. the minority of his son, Louis XIII. (1610 , Cardinal Richelieu, under the nominal of Marie de' Medici, the queen-mother, . with a firm hand, although his oppression Protestants at home, and his co-operation ıem abroad, in endeavouring to humble the of Austria, entailed long and costly wars with ıme on France. Cardinal Mazarine, under ency of the queen-mother Anne of Austria, nearly equal power for some time during nority of Louis XIV. (1643–1715). The the Fronde, the misconduct of the parlia- nd the humbling of the nobility, gave rise to civil war, but with the assumption of power ıg Louis, a new era commenced, and till near e of his long reign, the military successes of nch were most brilliant, and the boundaries ere enlarged by conquests and treaties very o what they are now. The military glory of gdom was maintained by a host of gallant ıders, amongst whom stood conspicuous the of Turenne, Vauban, Luxembourg, Catinat, ıe, Boufflers, and Créqui, while, by the far- policy of the minister Louvois, a well-organ- ıy and a newly-created navy made the power rmidable to all neighbouring nations. The ı of the people in the arts of peace was not ked. At the close of his rule, the oppressive es, the prodigality of the court, the luxurious the clergy, and the absolutism and bigotry aged monarch, combined to undermine the foundations of national prosperity and freedom, and at his death the state was left trammelled with a debt of 3500 millions of livres, and his youthful heir, Louis XV. (1715–1775), succeeded to a heritage whose glory was tarnished, and whose stability was shaken to its very foundations. The long inglorious reign of Louis XV. presents nothing worthy of notice except the gradual rise of those sentiments of infidelity and licence which prepared the overthrow of all the ancient institutions of the country. The regency of the profligate Orleans paved the way for the miseries which followed, while his corrupt financial administration brought the nation into the most overwhelming monetary embarrassments. In this reign, Corsica was added to France. The thorough disorganisation of the state, and the neglect of the fleet and army, prevented all attempts at conquests either on sea or land. The colonies were left a prey to the attacks of other powers, while the capricious change of policy which the king's mistress, Madame Pompadour, forced upon the government, brought contempt upon the country. The peace of Paris, 1763, by which the greater portion of the colonial possessions of F. were given up to England, terminated an inglorious war, in which the French had expended 1350 millions of francs. The close of this unhappy reign was still further disturbed by the cabals of the Jesuits, who were finally banished in 1764. In 1774, Louis XVI., a well-meaning, weak prince, succeeded to the throne. His first ministers, Maurepas, Turgot, and Malesherbes, had not the vigour to carry out the reforms which their sense and patriotism suggested to them, and they were soon compelled to yield to the intrigues of the nobility, and resign their places. They were succeeded by the financier Necker, who endeavoured, by economy and method, to arrest the impending bankruptcy of the state, and succeeding ministers made futile attempts to diminish these financial disorders by new forms of taxation, which were generally opposed either by the assembly or the court. The American war of freedom had disseminated republican ideas among the lower orders, while the Assembly of the Notables had discussed and made known to all classes the incapacity of the government, and the wanton prodigality of the court. The nobles and the *tiers état* were alike clamorous for a meeting of the states; the former wishing to impose new taxes on the nation, and the latter determined to inaugurate a thorough and systematic reform. After much opposition on the part of the king and court, the *états généraux*, which had not met since 1614, assembled at Versailles on the 25th of May 1789.

F. was at that moment ripe for a revolution. Although the nobility was exceedingly numerous (as not only did the children of a noble belong to this class, but its numbers were constantly being increased by creation), there were great differences in the rank and dignity attached to the order; thus, in 1789, there were only 44 secular peers, independently of the princes of the blood, and the six originally created ecclesiastic peers; but the lower grades of nobility were so numerous that their numbers stood in the ratio of 1 to 250 of the entire population. Nevertheless, every grade of nobility exempted its holder from the payment of the ordinary land-tax, or *taille*, from the charge of maintaining the public roads (*corvée*), from military conscription, from receiving billets of soldiers, &c. The nobles paid the *capitation* tax, but in a very unequal proportion, although the landed property was vested almost entirely in their hands. They, in fact, monopolised (together with the clergy) the principal share of the national revenues, and left to the lower classes the burden of labour and of paying the taxes. At the outbreak of the Revolution, the French nobility

were sunk in profligacy, and fallen to the lowest stage of demoralisation. The clergy kept pace with the nobles in general depravity, and while their aggregate revenues amounted, according to Necker, to 130,000,000 of livres, and their landed property stood in the relation of 1 to 5¾ of that of all other proprietors, their contributions towards the maintenance of the state were inadequate and irregular; the open profligacy and wasteful excesses of many of the higher members of the hierarchy, brought the whole order into disrepute. Francis I. had wrung from the church a tithe, known as the *décime paschaline*, and every five years the clergy were expected to present their so-called *dons gratuits ordinaires*, of from 15 to 18 million of livres; while on occasions of need they from time to time made extraordinary *dons gratuits*, which, however, were usually repaid at long intervals. The *tiers état* were crushed by the weight of an unjust taxation, which was rendered more obnoxious by the system of farming out some of the taxes. The most tyrannical of these was the tax on salt. The municipal institutions which had been permitted to flourish under some of the Valois princes in the middle ages, were almost entirely abolished, and the offices of towns, like those of the state and the courts of justice, were either hereditary or open to purchase; the *tiers état*, which included professional men, and all who were not either members of the noble or the clerical orders, saw themselves utterly excluded from all participation in the privileges and duties of free citizens, at the very time when the extensive circulation of the writings of the philosophers of the 18th c., as Voltaire, Malesherbes, Rousseau, and Montesquieu, had habituated men's minds to the discussion of questions of political independence, equal rights, and universal freedom.

The resistance made by Louis and his advisers to the reasonable demands of the Deputies on the 17th June 1789, led to the constitution of the National Assembly—a measure which was followed, on the 23d of June, by a declaration of the inviolability of the members. The king retaliated by ordering a large body of troops under arms, dissolved his ministry, and banished Necker, whom he had shortly before recalled under the pressure of public opinion. The consequence was the outbreak of insurrectionary movements at Paris, where blood was shed on the 12th July. On the following day, the national guard was convoked; and on the 14th, the people took possession of the Bastille. The provinces repeated the acts of Paris, and everywhere national guards and revolutionary municipal councils were called together. On the 4th of August, feudal and manorial rights were abrogated by the National Assembly, which gave expression to a solemn declaration of the equality of human rights. The royal princes and all the nobles who could escape sought safety in flight. The royal family having attempted in vain to follow their example, tried to conciliate the people by the feigned assumption of republican sentiments; but on the 5th October, the rabble, followed by numbers of the national guard, attacked Versailles, and compelled the king and his family to remove to Paris, whither the Assembly also moved. The next two years witnessed the solemn inauguration and the subsequent retraction of various constitutional schemes; the princes of the blood and the ancient noblesse raised corps of emigrés in different parts of the country, but their efforts could not arrest the spread of republicanism. The king alternately made concessions to the republicans, and cherished schemes for escaping from their surveillance, but each month added to his humiliations and to the audacity of those surrounding him. A war with Austria was begun in April 1792; and the defeat of the French was visited on Louis, who was confined in August with his family in the Temple. The advance of the Prussians into Champagne threw Paris into the wildest excitement. The National Assembly dissolved itself in September. In December, the king was brought to trial, and called upon to answer for repeated acts of treason against the republic. On the 20th January 1793, sentence of death was passed upon him; and on the following day he was beheaded. Revolts burst out in every part of France. England, Holland, Spain, Naples, and the German States combined together against the republic. Christianity was now formally deposed, and the sacredness of the republic and the worship of Reason solemnised. Marie Antoinette, the widowed queen, was guillotined; the dauphin and his surviving relatives suffered every indignity that malignity could devise. A reign of blood and terror succeeded. Danton and Robespierre, after having condemned countless numbers to the guillotine, suffered each in turn a similar fate. After the destruction of the Terrorists, a reaction was gradually established; the people were wearied of bloodshed, and anxious for peace and order at any cost. The brilliant exploits of the young general, Napoleon Bonaparte, in Italy, turned men's thoughts to other channels. In 1795, a general amnesty was declared, peace was concluded with Prussia and Spain, and the war was carried on with redoubled vigour against Austria. The Revolution had reached a turning-point. A Directory was formed to administer the government, which was now conducted in a spirit of order and conciliation. In 1797, Bonaparte and his brother-commanders were omnipotent in Italy. Austria was compelled to give up Belgium, accede to peace on any terms, and recognise the Cisalpine Republic. The glory of the French arms was re-established abroad, but at home the nation were still suffering from the shock of the Revolution. The Directory repudiated two-thirds of the national debt, and thus almost ruined the commerce and credit of France. Under the pretext of attacking England, a fleet of 400 ships and an army of 36,000 picked men were equipped; their destination proved, however, to be Egypt, whither the Directory sent Bonaparte; but the young general, resigning the command to Kleber, landed in F. in 1799, and at once succeeded in supplanting the Directory, and securing his own nomination as Consul, conjointly with Sièyes and Roger Ducos. In 1800, a new constitution was promulgated, which, although in appearance purely constitutional, in reality vested the sole executive power in Bonaparte, who shewed consummate skill in re-organising the government, to which he imparted a systematic efficiency and a spirit of centralisation, that secured a thoroughly practical administration. Having resumed his military duties, he marched an army over the Alps, attacked the Austrians unawares, and decided the fate of Italy by his victory at Marengo. In 1801, the peace of Lunéville was concluded, and the boundaries of F. were extended to the Rhine. England was the only country which refused to recognise the legality of the various Italian and German conquests of F.; and with the exception of a brief period of peace, this country remained the implacable foe of Bonaparte from the days of the Consulate to his defeat at Waterloo. Every period of respite from war was employed by the First Consul in reinstating trade and industry, and in obliterating both in private and public life the stains left by the Reign of Terror. In 1804, on an appeal by universal suffrage to the nation, Bonaparte was proclaimed emperor. The

d the former excitement of war and conquest,
reated with an indifference, and even con-
by the returned emigrés, to which they were
unaccustomed. On the 1st March 1815,
on left Elba, and landed in France. Crowds
d him; the soldiers flocked around his
rd; the Bourbons fled, and he took possession
r lately deserted palaces. The news of his
spread terror through Europe; and on the
March, a treaty of alliance was signed at
, between Austria, Russia, Prussia, and
d, and preparations at once made to put
down the movement in his favour, and restore the Bourbon dynasty. At first, the old *prestige* of success seemed to attend Napoleon; but on the 18th June, he was thoroughly defeated at Waterloo; and having placed himself under the safeguard of the English, he was sent to the island of St Helena, in conformity with the generally acknowledged sentiment, that it was necessary to the peace of Europe to remove him finally and definitely from the scene of his former power. The second restoration gave occasion to many pledges of a more liberal policy on the part of Louis, but few of them were fulfilled, and a general and sullen discontent reigned among the people, who were again deprived of all voice in the administration, or in the election to offices, and were harassed by the petty tyranny of the priests, who were the favourite advisers of the crown. In 1821, Napoleon breathed his last at St Helena; and in 1824, Louis XVIII. died without direct heirs, and his brother, the Duc d'Artois, succeeded as Charles X. The same ministerial incapacity, want of good faith, general discontent, and excessive priestly influence characterised this reign, which was abruptly brought to a close by the revolution of 1830, and the election to the throne of Louis Philippe, Duke of Orleans, as king, by the will of the people. Legitimist insurrections disturbed the nation; one *émeute* succeeded another; attempts upon the king's life were frequent; but the progress in material prosperity made the government popular with the *bourgeoisie*, or middle classes, and for a time it held its ground. The policy of the king was to amuse the populace, and flatter the national vanity, which was gratified by the Algerine war, successfully terminated by the costly acquisition of Algeria in 1835; but the throne of 1830 could not stand against any unexpected shock; and the dissatisfaction arising from the scarcity of the harvests and the high prices of 1847, were soon followed by open demonstrations of insurrection; and in 1848, the hostile bearing of the national guards, when called upon to defend the king against the *émeute* in Paris, left him, as he thought, no alternative but to abdicate. Much blood was shed at Paris in an attack on the barricades, when the archbishop and many other persons of distinction were slain, and in the following December, Prince Louis Napoleon Bonaparte (the nephew of the Emperor, and son of his brother Louis, king of Holland) was proclaimed president of the republic. By a *coup d'état*, the president prevented the national revolution, which general rumour had led people to expect in 1852; and having dissolved the Assembly, assumed dictatorial powers, and appealed to the people to sanction his act by their votes. The army had already been won over by him; and on his nomination by universal suffrage to the presidency for ten years, he promulgated a new constitution, very similar to the one framed by Napoleon I. in 1799. This measure was followed in December 1852 by a motion of the senate for the re-establishment of the Empire. Another appeal to the nation was accordingly made under the same apparently coercive pressure as on the former occasion, and with a similar result; and since December 2, 1852, Prince Louis Napoleon has exercised the most absolute power over F., under the title of the Emperor Napoleon III. FRANCE, Isle of. See Mauritius.

FRANCE'SCO DI PAULA, founder of the order of the *Minims*, was born in 1416 at Paula or Paolo, a village of Calabria. From birth, his destination was the church, for which he was happily fitted by nature and preference. At the age of 12, he was the inmate of a Franciscan convent, practising with the utmost rigour the regulations of the order; and at 14, renouncing all worldly possessions, he retired to a cave, where he inflicted on himself every species of self-mortification, and devoted his time to prayer and meditation. The fame of his piety having attracted to his cell several emulators of his austere life, he received permission from the bishop to erect a church and convent, and the new community received from Pope Sixtus IV. the title of the Hermits of St Francis. To the usual conventual vows, F. added one of the most rigorous abstinence—flesh, eggs, and milk being strictly forbidden the entire year, except in illness. Popular report having attributed to F. several wonderful cures, Louis XI. of France, the most superstitious of monarchs, being severely ill, summoned him to his presence, in hopes of some miraculous display of power on his behalf. F. repaired to France, where he was received with the highest honour, and attended the king on his death-bed. The successors of Louis, Charles VIII. and Louis XII., treated F. with great favour, consulted him in important matters, and induced him to settle in France. Charles VIII. built him a convent at Plessis-le-Tour, and another at Amboise. F. died at the former in 1507, and was canonised in 1519.

FRANCHE COMTÉ, an old province in the east of France, in the basin of the Rhone, comprised what now forms the departments of Doubs, Haute-Saône, and Jura, and had for its capital Besançon.

FRA'NCHISE. In its political acceptation, the franchise may be said to be the right which centres in the individual holding it to exercise a certain limited portion of the general sovereignty of the state. A franchise in this sense is possible only in a free state, i. e., in a state in which the governed, as a whole, are identical with the governors. It does not necessarily involve the idea of representative government; for where legislation is effected by the votes of the people themselves, as it was in the small states of antiquity, the franchise is exercised by each individual directly, without the intervention of any representative machinery. Where representation has been introduced, the franchise is the right which the citizen has of voting for his representative, not the right of voting in the legislative body conferred on the representative in consequence of being sent thither, and is an expression not of the sovereignty which centres in him, but of that which belongs to the constituents who send him. There would be no theoretical inconsistency, however, in applying the term franchise to the right of voting in the House of Lords, which belongs to each peer, because he here exercises the sovereignty, or original freedom which belongs, or is supposed to belong, to himself, and does not represent that of others. As the franchise is the political expression of the sovereignty which centres in each free citizen, the extent or value which ought to belong to the franchise will be measured by the amount of the sovereignty which it expresses. But this sovereignty again corresponds, or finds forms of actual expression, in the social position which the individual occupies, in the amount of power and influence which is conceded to him by the society of which he is a part. A theoretically just franchise, then, would be one which corresponded accurately to the social position of each individual, which translated the verdict by which society fixed his status into the language of politics. But scientific accuracy in such matters, for obvious reasons, is unattainable. An approximation in the individual case is all that is possible in dealing with the mass, and one of the questions which is at present most keenly discussed amongst speculative politicians is, by what test shall this approximate estimate of social value be brought most nearly to the truth. Mr J. S. Mill has proposed intelligence, as indicated by instruction, as the sole measure of individual sovereignty, and, consequently, as the basis of the franchise (see his recent work on Representative Government). Others have proposed wealth; whilst by a third class of speculators it is contended that, in the case of each individual, there are various elements of social importance which must be taken into account in determining the political value which is his due. By all the more recent writers on the theory of government, however, the idea of all citizens being entitled to an equal suffrage, however great might be the disparity of intelligence, wealth, manhood, and other elements which go to make up social importance, is repudiated as a scientific absurdity, and reprobated as the source of all the practical injustice which results from what are commonly known as democratic governments. See Mill's work, alluded to above; also Parliamentary Elections.

FRANCHISE in England is a royal privilege, or branch of the crown's prerogative, subsisting in the hands of the subject. Being derived from the crown, franchises must arise from royal grant, or in some cases may be held by prescription, which presupposes a grant (Stephen's *Com.* i. 637). The subjects of franchise being the peculiar property of the crown, correspond with what in Scotland are called Regalia (q. v.); and a franchise is analogous to a grant of regalia. Gifts of waifs, estrays, wrecks, treasure-trove, royal fish, and forfeitures, all of which are the prerogative of the crown, are franchises. The rights of forest, chase, park, warren, and fishery are also franchises, no subject being entitled so to apply his property for his own convenience. A county palatine (see Palatine) is the highest species of franchise, as within it the earl, constable, or other chief officer, may exercise without control the highest functions of the sovereign. And as the crown may thus erect an entire county into an independent jurisdiction, so it may create a liberty or bailiwick independent of the sheriff of the county. This, then, is another species of franchise. It is likewise a franchise for a number of persons to be incorporated, and subsist as a body-politic, with a power to maintain perpetual succession, and do other corporate acts; and each individual member of such corporation is also said to have a franchise or freedom. The right to hold a fair or market, or to establish a ferry, and to levy tolls therein, is also a franchise. Where the holder of a franchise is disturbed in his right, he may sue for damages by an action on the case; or in the case of non-payment of tolls, he has the remedy of Distress (q. v.). Franchises may be extinguished by reunion with the crown, or may be lost by *misuser*—that is, such a use of them as is contrary to the express or implied condition on which the royal grant proceeded—or by *non-user*.

FRANCIA, Dr José Gaspar Rodriguez, Dictator of Paraguay, was the son of a small landed proprietor, of French or Portuguese origin, and was

ar the town of Asuncion in 1757 or 1758. intended for the church, studied at the ity of Cordova de Tucuman, where he took ee as a doctor of divinity or of canon law, s for some time a theological professor. tently he adopted the profession of law, practice of which he continued to devote for a period of thirty years, gaining much on for learning, skill, honesty, and inde- e of character. When he had attained of fifty-two or fifty-three, the revolution hattered the Spanish yoke in South America ut in Buenos Ayres. Paraguay at first active opposition to the revolutionists, but ly sought to obtain independence for itself. a leading part in the movement, and de secretary of the independent junta set he soon resigned his post. The conviction, r, being strong in the public mind that F. uld properly direct the affairs of the new , he was, in 1813, appointed joint-consul ith General Yegros. The latter, however, man apparently without much intellect or and F. was really sole ruler from the first. , he was appointed dictator for three years, expiry of which time the dictatorship was im for life; and the absolute control so d he exercised until his death in 1840.

F., the condition of Paraguay rapidly d, and the system of non-intercourse, poli- commercial, with other nations, which he l, however much it may seem to prove him of administrative sagacity, was undoubtedly d with good results to his country. So ere the regulations against foreign inter- that ingress to, or egress from, Paraguay was impossible; and F.'s treatment of some rs who did get in (among others the famous Bonpland), and of others who were pre- entering, savoured of harshness, and even m. Yet his administrative talent was of order. He improved agriculture, making ps of corn grow where only one had grown He introduced schools, promoted educa- pressed superstition, and enforced strict between man and man in his law-courts. th was regretted by the people as a public y—the best proof that he was no vulgar See Rengger and Longchamp's *Essai His-* &c. (Paris, 1827); *Francia's Reign of Terror* , 1839), by J. P. and W. P. Robertson, two Scotchmen whom F. turned out of the ; and T. Carlyle's essay in the *Edinburgh* (1843).

NCIS, OF ASSISI, founder of the Franciscan nd a saint of the Roman Catholic Church, of the most extraordinary men of his age, rits a detailed notice, as illustrating in his ll the most remarkable characteristics of the life of the middle age. He was born in f the family called Bernardini, at Assisi, is father was engaged in trade. His bap- ame was John; but from his familiarity Romance, or language of the troubadours, uth, he acquired the name of *Il Francesco* tle Frenchman'). In his early years, he was ble for his love of gaiety and ostentatious ity; but even then his bounty to the poor of the largest sources of his wastefulness. aged eagerly in exercises of chivalry and of nd in one of the petty feuds of the time, he en prisoner, and detained for a year in cap- Perugia. An illness which he there con- arned his thoughts from earth; and although a engaged in military pursuits, a second Spoleto decided his career for life. He now resolved to fulfil literally the counsels of the gospel, and he especially devoted himself to poverty, which, in the mystic language thenceforth familiar to him, he designated as 'his bride.' Under an impulse which he received while listening to a sermon, he took a vow never to refuse alms to a beggar. He made a pilgrimage to the tomb of St Peter at Rome, and there offered to God all that he possessed on earth. On his return to Assisi, he exchanged his clothes with a poor mendicant; and disregarding all remonstrance and ridicule, he ever afterwards continued to wear the meanest attire. He gave to a priest who was rebuilding a ruined church the price of his horse, which he sold for the purpose, and even sought to appropriate to the same use the moneys of his father, which, however, the priest refused to accept. To avoid his father's anger, he took refuge in a cave, in which he spent a month in solitary prayer, and from which he returned more than ever confirmed in his enthusiasm. His father having in vain confined him in a dark room of his own house, cited him before the magistrates, and, on F.'s declining all civil jurisdiction in such a case, before the bishop, in order to compel him to renounce his inheritance. F. abandoned all, even to the very clothes he wore, and then declared that 'till now he had been the son of Bernardini, but that henceforth he had but one Father, Him that is in heaven.' Thenceforth, no humiliation was too low for F.; he begged at the gates of monasteries; he discharged the most menial offices; he served the lepers in the hospital at Gubbio in their most revolting necessities, and with the most tender assiduity. He worked with his own hands at the building of the church of St Damian, and at that of Sta Maria degli Angeli, which he afterwards called his 'Portiuncula,' or 'little inheritance;' and as the last act of self-spoliation, and the final acceptance of the gift of poverty, he threw aside his wallet, his staff, and his shoes, and arrayed himself in a single brown tunic, of coarse woollen cloth, girt with a hempen cord. This was in his 26th year, in 1208. His enthusiasm by degrees excited emulation. Two of his fellow-townsmen, Bernard Quintavalle and Peter Cattano, were his first associates. They were followed, although slowly, by others; and it was not till 1210, that, his brotherhood having now increased to eleven in number, he drew up for them a rule, selected in the true spirit of religious enthusiasm, by thrice opening at random the gospels upon the altar, and taking the passages thus indicated as the basis of the young institute. (Milman's *Latin Christianity*, iv. 264.) The new brethren repaired to Rome, where their rule was approved (though at first only *viva voce*) by Pope Innocent III. in 1210. The two following years were spent by the brotherhood in preaching and exhorting the people through the rural districts of their native and the adjoining provinces; and F. himself returned to Assisi in 1212, at which time he finally settled the simple constitution of his order, the church of Sta Maria degli Angeli being assigned to them as their home. In common with the older forms of monastic life, the Franciscan institute is founded on the three vows of chastity, poverty, and obedience; but of these the second was, in the eyes of F., the first in importance and in spiritual efficacy. In other orders, the practice of poverty consisted in the mere negation of riches. With F., it was an active and positive principle. In other orders, although the individuals could not possess, it was lawful for the community to hold, property in common. F. repudiated all idea of property, alike for his order and for its members; he even disclaimed for them the property in those things which they retained for personal use—the

clothes which they wore, the cord with which they were girded, the very breviary from which they chanted the divine office. The very impossibility, to human seeming, of these vows, was their strength. Numbers crowded to the standard of Francis. He told them off in parties to different provinces of Italy. Five of the brotherhood repaired to Marocco to preach to the Moors, and, as the first martyrs of the order, fell victims to their holy daring. Success removed all the hesitation with which the institute at first was regarded, and in 1216, the order was solemnly approved by Pope Innocent. From this date it increased with extraordinary rapidity. At the first general assembly, held in 1219, 5000 members were present; 500 more were claimants for admission. F. himself inaugurated the future missionary character of his brotherhood by going (1223) to the East, and preaching the gospel in the presence of the sultan himself; but the only fruit of his mission was a promise from the sultan of more indulgent treatment for the Christian captives, and, for the Franciscan order, the privilege which they have since enjoyed, as guardians of the Church of the Holy Sepulchre. It is after his return to Italy that his biographers place the celebrated legend, which, to friends or to enemies, has so long been a subject of veneration or of ridicule—his receiving, while in an ecstasy of prayer, the marks (*stigmata*) upon his own person of the wounds of our Divine Redeemer. The scene of this event is laid on Monte Alverno, a place still sacred in the traditions of the order; and the date is September 17, 1224. Two years later, St F. died, October 4, 1226. On the approach of his last hour, he requested that he should be carried upon a bier to the church, where he had himself placed on the bare ground, thus realising in his own death the most literal extreme of the doctrine which he had made in life the basis of his system. He was canonised by Pope Gregory IX. in 1228.

The works of St F. (folio, Pedeponti, 1739) consist of letters, sermons, ascetic treatises, proverbs, moral apothegms, and hymns. The latter are among the earliest metrical specimens of the Italian language. They are exceedingly simple, and full of the tenderest expressions of the love of God. His prose is often more poetical than his poetry itself, abounding in allegory and poetical personification. Few writers have ever turned the love and admiration of external nature to a purpose so beautifully devotional. 'Of all the saints,' says Dean Milman, 'St Francis was the most blameless and gentle.' No saint, it may be added, has been the subject of more exaggerated panegyric from the writers of his order; and one of the works in his praise—a parallel between St F. and our Divine Redeemer—is disowned by the Roman Catholic community as a most reprehensible exaggeration, the fruit of an affectionate, but most misdirected zeal for the memory of the founder of the Franciscan order.

See the Bollandist, *Acta Sanctorum*, October 4; St Bonaventure's Life of St Francis, with Wadding's notes; Helyot, *Hist. des Ordres Religieux*, tom. vii.; Butler's *Lives of Saints*, October 4; Milman's *Latin Christianity*, vol. iv.; Gieseler's *Church History*, vol. iii.; Döllinger's *History of the Church; St Francis and the Franciscans* (Dublin, 1861).

FRANCIS, SIR PHILIP, son of the Rev. Dr Philip Francis, author of a well-known translation of Horace, was born at Dublin, October 22, 1740, and educated at St Paul's School, London, where he had for a school-fellow Henry S. Woodfall, afterwards the printer of the *Public Advertiser*, and the publisher of the *Letters of Junius*. In 1756, he obtained a place in the office of Mr Fox, then secretary of state, which he retained under his successor Mr Pitt. In 1760, he became secretary to the Earl of Kinnoul, who had been appointed British ambassador to Portugal; and on his return to England in 1763, he received an appointment in the War-office. Ten years later, he was sent out to India, as a member of the council for the government of Bengal, with a salary of £10,000. Here he came into collision with the governor-general, Warren Hastings, and so far did the quarrel proceed, that a duel was the consequence, in which F. was severely wounded. In December 1780, he resigned his situation, and returning to England, entered parliament for the borough of Yarmouth, in the Isle of Wight, in 1784. He never obtained a reputation as an orator, but his great abilities and extensive information always commanded the respect and attention of the House. The prosecution of Hastings, begun in 1786, was hailed by him with malignant joy, and it must be confessed that he displayed a most ungenerous alacrity and activity in furthering the designs of the committee of impeachment. In his political opinions, F. was a decided and consistent Whig, at a time when Whiggism meant very much the same as the Radicalism of a later period. He exulted at the success of the French Revolution, was an active member of the association of 'Friends of the People,' and ably supported the efforts of Fox and Grey for a reform in the representation of the nation. He withdrew from parliament in 1807, and died December 22, 1818. F. wrote upwards of twenty political pamphlets. He has also been considered by many to have the best claim to the authorship of the *Letters of Junius* (q. v.).

FRANCIS I., king of France, son of Charles, Comte d'Angoulême, was born at Cognac, September 12, 1494, and in his youth manifested an ardent love for literature, especially for the romances of chivalry, whence, probably, he drew his brilliant but erroneous views of a kingly character. At the age of twenty, he married Claude, daughter of Louis XII., and succeeded his father-in-law, January 1, 1515. His first act, after mounting the throne, was to set about the reconquest of Milan, which had been wrested from his predecessor two years before; and at the head of 40,000 men, among whom were such great warriors as the Constable Bourbon, Bayard, Lautrec, and Trivulzio, F. crossed the Alps, and attacked the Swiss allies of the Milanese at Marignano, ten miles from Milan. Here a sanguinary battle, afterwards called the 'battle of the giants,' ensued (13th September 1515), in which F. obtained a complete victory—the Swiss losing 12,000 men. In accordance with his chivalrous propensities, F. accepted knighthood on the field from the renowned Bayard. After some further successes, F. returned to Paris in the month of February 1516. On the death of Maximilian, emperor of Germany, in January 1519, F. and Charles of Spain became rival candidates for the imperial crown. The election of the latter excited the anger of F., who immediately prepared for war, and endeavoured to secure the alliance of Henry VIII. of England. An interview took place in 1520 between the two monarchs on the famous *field of the cloth of gold*, between Guines and Ardres, but it led to no result, and shortly after, Henry formed an alliance with the pope and the emperor against Francis. The papal troops drove the French out of Italy; and the soldiers of Henry and the emperor invaded France on the north, while, to complete his perplexities, the Constable Bourbon, who was discovered to be conspiring against his sovereign, fled to Charles, who gladly accepted the sword of the renegade warrior. F. gallantly faced the dangers that now threatened his kingdom. A large army was sent

y under the command of Bonnivet, who, r, proved incapable, and was forced to retreat the Alps. In the course of this retreat, lost his life. The imperialists now advanced ovence, but, on the approach of the French withdrew into Italy, whither they were d by F., who overran Lombardy, but was defeated and taken prisoner at the battle of 24th February 1525. Charles carried his to Madrid, and only granted him his liberty hardest conditions. F. had to renounce the nty of Flanders and Artois, the duchy of dy, and all his Italian possessions and pre- es, to promise the restoration of Bourbon to ner dignities, and to surrender his two sons ages. He obtained his freedom, March 17, but regarding the conduct of Charles as base, his first act, on his return to his ons, was a refusal to fulfil the pledges he ren. Pope Clement VII. absolved him from h; England, Rome, Venice, Florence, and —all of whom were growing alarmed at the e power of Charles—withdrew from the l alliance, and sided with his antagonist. r in Italy now recommenced. On the 5th 27, Bourbon's 'black banditti' stormed and the 'Eternal City,' and captured the pope. sent troops into Naples, which, after a f brilliant successes, were almost wholly cut lisease, mainly through the negligence of the ho failed to supply them with the means of ence. About the same time, F. sent a chal- o Charles to decide their quarrel by single . The challenge was accepted, but the duel ame off. At last, a peace was concluded at y, in July 1529, much to the advantage of aniards. In 1534, however, war broke out n F. and the Duke of Milan: and in the g year the former overran Savoy, to which claim by the absurdest pretensions. The t of Charles at this period was marked by eatest moderation, but he was ultimately ved in hostilities with his inveterate oppo- Little definite result ensued, but the war was by a circumstance regarded as horrible in lays—viz., an alliance between Christians rks. F. formally entered into a league with tan Soliman, who went so far as to land in the south of Italy, but the French king from a practical co-operation with the arch- of Christendom. By the efforts of Pope II., a treaty was concluded for ten years at etween Charles and F., 18th June 1538. t of fact, however, peace lasted only four nd in 1542, F., insatiable of glory, launched fferent armies against the emperor. The of Cerisolles, 14th April 1544, in which the were completely victorious, partially wiped disbonour of the defeat at Pavia, but a alliance of F. with the Turks renewed the tion of Christendom. Charles, and Henry England, marched upon Paris, and F. was led to make peace at Crepy, 18th September His political rôle was now finished. He Rambouillet, March 31, 1547. It is not to estimate the character of this monarch. d voluptuous (it was the physical conse- of an amour which cost him his life), he was pable of heroic impulses and acts of splendid rty. But no amount of 'chivalry' could sate for the lack of political sagacity; it ot even save him from deeds of cruelty. His tion of the Vaudois and other 'heretics' has dark stain on his memory, which all his ge of arts and letters will not efface. F. mself a writer of verses; but these were so bad, that even French critics pronounce them almost intolerable.

FRANCIS I. (STEPHEN), Emperor of Germany, born in 1708, was the eldest son of Leopold, Duke of Lorraine. On the death of his father, in 1729, F. succeeded him in the dukedom, which, in 1735, he ceded to Stanislaus Leszcynski, father-in-law of Louis XV., to revert after his death to the crown of France. In lieu of Lorraine, he obtained the grand duchy of Tuscany, whose native rulers, the Medicean family, were about to die out. In 1736, he married Maria Theresa of Austria, the only daughter and heiress of the Emperor Charles VI. In 1740, Charles died, and Maria Theresa succeeded him; she made her husband co-regent with herself, but gave him little share in the administration. F. fought bravely for his wife's rights in the wars carried on against Frederick the Great. In 1745, he was elected to the once important dignity of Emperor of Germany, and crowned at Frankfurt. The famous Seven Years' War (1756—1763) now broke out between Austria and Prussia; but the cares which it imposed fell mainly upon his leonine consort, Maria Theresa. F. died at Innspruck, 18th August 1765. His son Joseph succeeded him in the imperial dignity, but Maria Theresa retained in her hands the sovereignty of the Austrian dominions till her death.

FRANCIS II., Emperor of Germany, and I. of Austria, the eldest son of Leopold II. Grand Duke of Tuscany, and of Maria Louisa, daughter of Charles III., king of Spain, was born at Florence, in February 1768. In 1790, his father became Emperor of Austria by the death of his brother Joseph, but died only two years after, when the crown devolved upon Francis. The French Revolution was now exciting the alarm of the old European dynasties; F. concluded an alliance with Prussia against the new republic; and the armies of the allies marched to the frontiers of France, but soon recoiled before the fiery enthusiasm of the republican troops. In 1794, F. placed himself at the head of the army of the Netherlands, which, on the 26th of April, defeated the French at Cateau and Landrecy; and on the 22d of May, gained the bloody battle of Tournay; but on the whole the fortune of the war was against him; and the triumphs of young General Bonaparte in Italy forced him to conclude the treaty of Campo Formio (October 17, 1797). Only two years afterwards, however, F., in alliance with Russia and England, again took up arms, and was at first successful; but the recall of the brave Russian general, Suwaroff, and the return of Bonaparte from the East, quickly altered the state of matters. The great victories won by Moreau at Hohenlinden, and by Bonaparte at Marengo, paralysed the powers of Austria, and F. was compelled to sue for peace, which was obtained by the treaty of Lunéville in 1801, by which the whole of the left bank of the Rhine was ceded to France. In 1805, the aggressions of France once more excited the jealousy of Austria. F. entered into a new alliance with Russia; and the contest was renewed, but ended more disastrously than ever for the Austrians. The French victories of Ulm and Austerlitz, and the capture of Vienna, completely humiliated F., who, at the peace of Presburg (December 1805), was obliged to surrender the Venetian states and the Tyrol. The German empire was now dissolved, after lasting for 1000 years, and F. assumed the title of Emperor of Austria, King of Bohemia and Hungary. In 1809, he recommenced the war with Napoleon, and obtained more success, or perhaps we should say, encountered less loss than on previous occasions. The tremendous

battle of Aspern was a victory, though not a decisive one, and did much to restore the prestige of the Austrian arms. Still Napoleon again got possession of Vienna, and dictated terms of peace from the palace of Schönbrunn in October of the same year. In 1810 the French emperor married F.'s daughter, Maria Louisa. A permanent friendly alliance now seemed to be concluded between the two empires; and during the Russian campaign in 1812, the Austrians rendered the French some slight assistance. In 1813, Austria resumed its neutrality; but, after having exerted himself fruitlessly to mediate between France and Russia, F. suddenly joined the allies, helped to win the battle of Leipsic, and followed the Russians and Prussians to Paris in 1814. His subsequent career does not present any points of special importance. He laboured honestly and indefatigably for the welfare of his subjects, encouraging the making of roads and canals, and the introduction of manufactures; but his horror of everything revolutionary, excited by his early recollections, and by the cruel death of his aunt, Marie Antoinette, and kept alive by his long wars with France, had rendered him an absolutist in politics, and a lover of that system of centralisation to which Austria continues to cling. F. died on the 2d of March 1835.

FRANCIS JOSEPH, the present Emperor of Austria, born 18th August 1830, is the eldest son of the Archduke Francis (son of the Emperor Francis I.), and Sophia, a princess of Bavaria. F. was taught to speak all the various languages of his heterogeneous dominions, and only the year before the Hungarian revolution addressed the Magyar nobles at Pesth in their own language—a circumstance which secured him a certain transient popularity. In 1848, he served under Radetzky in the Italian wars. The Emperor Ferdinand having, in the hour of his extremity, made certain constitutional promises to the nation, the archduchess, F.'s mother, who during the whole year had directed the schemes of the anti-revolutionary party, resolved that the fulfilment of these promises should be evaded by a change of sovereign. Ferdinand accordingly abdicated in favour of his nephew (2d December 1848), and F. assumed the government as Emperor of Austria, and King of Hungary and Bohemia. Hungary, however, which had lost all faith in the House of Hapsburg, rose in arms, and refused to accede to the change of succession; and Italy again tried the fortune of war. The progress of the struggle between F. and the constitutionalists of Hungary is described in the biographies of Kossuth, Bem, Dembinski, Batthyani, &c. Suffice it to say that Austria triumphed in Italy, and also in Hungary, through the treachery of Görgei and the help of Russia. F. now devoted himself, with characteristic persistency, to the re-establishment of 'order,' that is to say, of despotism. He dissolved the national guard, and took away the freedom of the press, and on January 1, 1852, abolished the constitution of his uncle, which had been a dead-letter from the beginning. In 1853 he nearly lost his life by assassination, and in the Crimean War forfeited the respect of all the belligerents by his indecisive attitude. The *concordat* of 1855, by which certain extraordinary privileges were conferred on the bishops of the Roman Catholic Church, was another step backwards, which very properly excited the apprehension of the liberal party in Europe. Meanwhile the dissatisfaction of Lombardy, Venice, Hungary, and Galicia, hourly increased. Sardinia (backed by France) encouraged the national feeling in Italy, and at last, in 1859, F. hurried thoughtlessly into a war with that kingdom, which ended in the peace of Villa Franca and the cession of Lombardy to Sardinia. F. is now engaged in a doubtful struggle with the disaffection of his Hungarian subjects. See AUSTRIA, HUNGARY.

FRANCI'SCANS, ORDER OF, also called MINORITES or LESSER BRETHREN, a religious order of the Roman Catholic Church, founded by St Francis of Assisi. For an account of the establishment of the Franciscan order, and its earliest fortunes, see FRANCIS OF ASSISI. The subsequent progress of the order was equally wonderful. In less than half a century it reckoned no fewer than 33 'provinces,' the aggregate number of convents in which exceeded 8000, while the members fell little, if at all, short of 200,000. Some idea, indeed, of the extraordinary extension of this remarkable institute may be formed from the startling fact, that, in the dreadful plague of the Black Death in the following century, no fewer than 124,000 Franciscans fell victims to their zeal for the care of the sick, and for the spiritual ministration to the dying! But this marvellous external progress was accompanied by serious internal controversies and divisions. In the original scheme of the institute, its great fundamental characteristic was poverty, which St Francis proposed to render in his order not only more perfect theoretically, but more systematical in its practice, than it existed in any of the contemporary institutes. For the accomplishment of this design, the rule which he drew up contained a few brief and simple, but, understood literally, very effectual provisions; but the difficulty of their literal observance led, even in the lifetime of St Francis, to an attempt in the general assembly of the order to introduce some important modifications; and, though the authority of the founder was sufficient to prevent the adoption of these modifications during his lifetime, and although his last will contained a special clause prohibiting not merely all change of the rule, but even all interpretation of it, the attempt was renewed with still more determination under Brother Elias, his successor in the office of general of the order. The great subject of controversy was the nature and extent of the obligation of religious poverty, as vowed in the order. Francis desired that it should be understood in the most rigorous sense; and, in his scheme of poverty, neither the individual brethren nor the entire community could acquire or retain any right of property even in things of necessary use. The rigorous party in the order sought to carry out this principle to the fullest extent; and they contended that it was unlawful for the order to acquire a right of property in houses, convents, or even churches; restricting their right in everything which they possessed to the simple use. Several successive popes sought, by explanatory decrees, to settle the dispute; and for a time a compromise was received, by which it was understood that the right of property in all *de facto* possessions of the order was vested in the see of Rome; but the foundations of the real controversy lay deeper than this. They regarded the practice, far more than the theory, of poverty; and the disputes to which they led eventuated not only in the formation of fresh offsets from the body in the new religious orders to be named hereafter, but also in a large, and, for a time, formidable, secession from the church in the sect of the Fraticellians. See FRATICELLIANS.

The supreme government of the Franciscan order, which is commonly said to be the especial embodiment of the democratic element in the Roman Catholic Church, is vested in an elective general, who resides at Rome. The subordinate superiors are, first, the 'provincial,' who presides over all the

a in a province; and secondly the 'guardian,' the head of a single convent or community. fficers are elected only for two years. The ial alone has power to admit candidates, e subjected to a probation of two years (see ATE); after which they are, if approved, ed to take the vows of the order. Those members who are advanced to holy orders o a preparatory course of study, during hey are called 'scholars;' and if eventually ed to the priesthood, they are styled 'fathers' rder; the title of the other members being r' or 'lay-brother.'

ry important feature, however, of the organ- of the Franciscan, as it subsequently be- other orders, is the enrolment of non-con- members, who continue to live in society t the obligation of celibacy; and in general, y bound by the spirit, and not the letter, of . They are called 'Tertiaries,' or members Third Order of St Francis. See TERTIARY. It ssible to overestimate the value of this insti- in the disorganised social condition of that he Tertiaries were bound, as the very first on of enrolment, to restore all ill-gotten to be reconciled with all those with whom d been at feud; to devote themselves to the e of works of Christian charity; to avoid all sary expenditure; to renounce the use of l ornaments; to hear mass daily; to serve the d the hospitals; to instruct the ignorant; a word, to practise as far as possible in the the substance of the virtues of the cloister. titute. in this form, undoubtedly exercised a l influence in medieval society. It counted s in every rank, from the throne to the ; and, although it was in some instances d by abuses and superstitious practices, the te results were undoubtedly beneficial.

Franciscan order has been the parent of ther religious institutes. The earliest of that of the 'Observantists,' or 'brethren of rict observance.' The origin of this body n already indicated. The party in the order contended for the more rigid observance of e, after a protracted struggle -in which dis- n to the church itself was often strongly sl (see SPIRITUALISTS)-- obtained a separate ation, which may be said to have been finally at the time of Leo X. The less rigid party, he name of 'Conventuals,' obtained a distinct , and an authorisation for their mitigated nce of the rule. Their churches and convents greater richness of architecture and decora- nd they are at liberty to acquire and retain, name of the order, the property of these and possessions, all of which are renounced by servant Franciscans. The latter community es nearly 150 provinces. Their constitution of the original rule, as already explained. A offshoot of the Franciscan order, and in the irection of rigorism, is that known as the hin,' founded by Matteo di Basio, a Francis- ther of the Observant rule, in the early part 16th century. Believing himself divinely to revive the old spirit of his order, and that the modern habit of the brethren was t from that of St Francis, he began with ia, and procured for himself, and obtained al permission to introduce (1528), the peculiar with a pointed hood or cowl (caputa), from the name of the reformed order is derived. with this habit, however, Matteo adopted a gorous and mortified course of life, in which joined by others of the brethren; and the spread so rapidly among the community, that in the year 1536 a general chapter of the new con gregation was held. They were subject, however, to the jurisdiction of the general of the Franciscan order. One of the first generals of the new reform was Bernardino Ochino, afterwards notable by his defection to Calvinism. After the Council of Trent, the Capuchins multiplied rapidly, though they were not introduced in France till the end of that century. A similar reform, to which the name of 'Recollets' was given (introduced in Spain by John de Guadaloupe, in 1500), was approved by Clement VII. in 1532; and many of the new brethren were among the first Spanish missionaries to the New World. A further development of the rigoristic spirit is the congregation of 'Discalced' or 'Barefooted' (q. v.) Franciscans. The author of this reform was a Spanish Capuchin, Peter of Alcantara. In his capacity of provincial of Estremadura, Peter introduced many reforms; and in 1555 obtained the approval of Pope Julius III. for a new rule, which was afterwards confirmed by Pius IV.

The notice of the Franciscan institute would be incomplete without the mention of the several orders of nuns; as those of St Clare, the Capuchinesses, the Urbanist nuns, &c., which formed part of the same general organisation. None of these, however, calls for any detailed explanation, or presents any very characteristic features.

The Franciscan order, in these several branches, has at all times maintained its popularity in the Roman Catholic Church. When Helyot, in the beginning of the 18th c., published his great *History of Religious Orders*, the Franciscan order numbered nearly 120,000 friars, distributed over above 7000 convents, and nearly 30,000 nuns, occupying about 900 convents. Since the French Revolution, the number has of course been very much diminished, the order having been suppressed in more than one kingdom; but it is still one of the most numerous in the Roman Catholic Church. Many of the foreign missions are mainly supplied by Franciscans, and they possess convents in almost every part of the world.

As a literary order, the Franciscans have chiefly been eminent in the theological sciences. The great school of the Scotists takes its name from John Duns Scotus (see SCOTUS), a Franciscan friar, and it has been the pride of this order to maintain his distinctive doctrines both in philosophy and in theology against the rival school of the Thomists, to which the Dominican order gave its allegiance. See THOMISTS. In the Nominalistic controversy, the Thomists were for the most part Conceptualists; the Franciscans adhered to the rigid Realism. See NOMINALISM. In the Free-will question, the Franciscans strenuously resisted the Thomist doctrine of 'predetermining decrees.' Indeed, all the greatest names of the early Scotist school are the Franciscans, St Bonaventure, Alexander de Hales, and Ockham. The single name of Roger Bacon, the marvel of medieval letters, the divine, the philosopher, the linguist, the experimentalist, the practical mechanician, would in itself have sufficed to make the reputation of his order, had his contemporaries not failed to appreciate his merit. Two centuries later, the great Cardinal Ximenes was a member of this order. The Popes Nicholas IV., Alexander V., Sextus IV., the still more celebrated Sixtus V., and the well-known Ganganelli, Clement XIV., also belonged to the institute of St Francis. In history, this order is less distinguished; but its own annalist, Luke Wadding, an Irish Franciscan, bears a deservedly high reputation as a historian. In lighter literature, and particularly poetry, we have already named the founder himself as a sacred poet. Jacopone da Todi, a Franciscan, is one of the most

characteristic of the medieval hymn-writers; and in later times, the celebrated Lope de Vega closed his eventful career as a member of the third order of St Francis. We may add that in the revival of art the Franciscan order bore an active and, it must be confessed, a liberal and enlightened part. See Wadding, *Annales Minorum Fratrum*, 8 vols.; see also Milman's *Latin Christianity*, vol. v.

FRANCISCO, San. See San Francisco.

FRA'NCKÉ, Aug. Herm., a distinguished German philanthropist, founder of the Orphan Asylum and several educational institutions at Halle, was born at Lubeck in 1663. Having studied languages and theology with great application and success, he first attracted attention by his academical biblical lectures in Leipsic, begun about 1685. These were more distinguished for piety, warmth, and zeal, than for attention to the strict and dry orthodoxy then in vogue; and the reception they met with from the public brought on F. envy and persecution as a heretic. He thought proper to yield to the storm, and withdrew in 1690 to Erfurt. In 1692, he obtained the professorship of Oriental languages in the newly instituted university at Halle, where he subsequently held a professorship of theology. He also received the pastoral charge of the suburb of Glaucha. The ignorance and poverty of his parishioners gave the first impulse to his benevolent labours. To the neglected poor and children that came to him for alms, he gave instruction on stated days, and as others joined, paying a school-fee of a penny a week, and the numbers rose to some sixty, he divided them into classes, and thus laid the first foundation of his educational establishments. At the same time the thought suggested itself of an orphan asylum, and in 1698 he laid the foundation of a special building for the asylum. Some years after, he erected a Pedagogium, a Latin school, and a boarding establishment connected with it. In 1714, there were 1075 boys and 700 girls receiving instruction from 108 teachers under the direction of Francke. He also had a missionary institution for the East Indies. To erect and maintain all these establishments required large sums of money; and it is surprising how F. succeeded in obtaining it without assistance from government. But so high was his reputation for disinterested benevolence, and in such a practical way did he set about his undertakings, never appealing for the charitable aid of others till he had first effected something himself, that contributions flowed in from all parts of Germany, and even from abroad. F. also instituted an apothecary's shop and bookselling in connection with his other operations, and thus obtained a considerable income for their support. Nor amidst all these voluntary labours did he neglect his duties as professor and pastor; he preached and lectured regularly, and also found time to study and write. He died June 8, 1727.

Francke's Institution, as it now exists in Halle, embraces the orphan house and schools erected by F., together with others since added; the number of pupils amounting in all to upwards of 2000. Bookselling, printing, and a laboratory for the preparation and distribution of medicines are also carried on in connection with education. The revenues consist of the profits of this industry, of the income from some property in land and funds, and of an allowance of £6000 from the state. The education imparted retains its religious character, but the excessive number of prayers and the otherwise conventual and ascetic character of the discipline have been diminished.

FRANÇOIS, St, is the name of two towns in the French West Indies.—1. St F. in Guadeloupe stands on the Grande Terre, the more easterly of the twin islands into which the colony is divided by an arm of the sea known as Salt River. It contains about 6600 inhabitants, about 5600 of them having been slaves down to 1848, the epoch of emancipation under the French Republic.—2. St F. in Martinique possesses a good harbour on the east coast. Of a population of 5966, 4272 had been slaves.

FRA'NCOLIN (*Francolinus*), a genus of birds of the family *Tetraonidæ*, closely allied to partridges, but distinguished by a stouter bill, a larger tail, and generally by a spur—in some species, two spurs—on the tarsus of the male. They are natives of Europe, Asia, and Africa. One species only, the European F. (*F. vulgaris*), is found in the most southern

Gray Francolin (*Francolinus Ponticerianus*).

parts of Europe; it inhabits also the north of Africa and great part of Asia. It is a beautiful bird; the plumage of the male is richly coloured. It frequents watery places, and feeds much on the tender tops of herbs. One (*F. Ponticerianus*) is very common in many parts of India, and is called Partridge in the Deccan, although it differs much in appearance from partridges, on account of its large rounded tail. Another (*F. spudicus*) abounds in some of the mountainous parts of India; and Africa has a number of species, some of which scrape up bulbs for their food. The Francolins generally inhabit forests and thickets, and roost in trees.

FRANCO'NIA (Ger. *Franken*). This name was first applied to those districts on both sides of the Maine which were originally peopled by colonies of Franks, under Thierry, the eldest son of Clovis, who inherited the Germanic possessions of his father on the death of the latter in 511. Under the Merovingian and Carlovingian dynasties, this province acquired a certain degree of preponderance in the state, and enjoyed the privilege of electing the king of the Germans within its own territories, and crowning the sovereign by the hands of its archbishop (Mayence), who was primate of the empire. In 911, Conrad, the Count or Duke of Franconia, for there is some doubt which of these titles was at that time borne by the ruler of the province, was raised to the throne; and a century later, after the ducal dignity had been recognised in F., the choice of the electors again fell upon the Franconian House, which, by its direct and collateral branches, gave kings and emperors to Germany from 1024, when Conrad II. began his reign, till 1250, when the indirect line of the Hohenstauffen family became extinct. During

nection with the crown, F. increased in extent mportance, while its great spiritual princi- of Mayence, Spires, Worms, and Würzburg d both wealth and political influence. In rse of the following 200 years, the province ent various modifications, and was sub- into numerous territories, as those of the h County-palatine, Nassau, Katzenellnbogen, , the landgravate of Hesse, &c., until the f F. was limited to the eastern portions ancient duchy, which included Würzburg, Bamberg, Nürnberg, Hohenlohe, &c. In Maximilian I. re-established the circle of F., then embraced the sees of Bamberg, Würz- and Eichstädt, Baireuth and Anspach, and counties and cities. With the dissolution of pire, the name of F. disappeared from among litical divisions of Germany; but since 1837 een revived in the kingdom of Bavaria (q. v.), those portions of the ancient Franconian e, which in modern times have been known circles of the Upper Maine, Rezat, and Lower are now designated Upper, Middle, and Lower nia. Upper F. includes the north-east portion aria. It is watered by numerous rivers, as ine, Raab, Saale, &c., and is intersected by the gebirge and by the hilly ranges of the Böhmer-, n-, and Steiger-Wald. The valleys produce rops and fruit, and the district is rich in ls. There are 38 civic and rural circles of tion in this province; capital, Baireuth. F., which abuts upon Würtemberg, is inter- by branches of the Franconian Jura chain, few rivers of importance besides the Regnitz ltmühl, which are connected by the great g Canal. It produces good wine, but is prin- celebrated for its hop-gardens. The chief are Anspach and Nürnberg, and it has 30 nd rural circles of jurisdiction. Lower F. schaffenburg, which occupies the north-west Bavaria, is traversed by the Spessart- and birge and the Steiger-Wald, and watered by aine and Saale. It is the richest and best ted of the Franconian circles, and is cele- for the excellence of its wines, the Steiner ister. The district is noted for its mineral at Kissingen, Brückenau, Orb, and Wipfeld. vided into 47 circles of jurisdiction; capital, urg.

NEKER, a handsome town of the Nether- n the province of Friesland, situated on the etween Harlingen and Leeuwarden, and 10 est of the latter place. It has won a name literary world as having been the seat of a ity founded in 1585 by the Frisian states on ggestion of Prince William Louis, Count of , and which ranked among its professors the t names of Vitringa, Schultens, Hemsterhuis, naer, and others. It was, however, abolished oleon in 1811, and in 1816 was transformed athenæum, to which a physiological cabinet otanic garden belong. F. also possesses a ted orrery. Pop. 5500.

NGIPANI, an illustrious and powerful House, which traces its origin to the 7th c., tained the summit of its glory in the 11th th centuries. In the early annals of Rome, members of this family occupied important offices, and seem to have taken a prominent all matters of moment. In 987, Crescenzio ani successfully vindicated the prerogatives Roman people against the encroachments of ohn XV. The rivalry of the F. House with f the Pietro Leoni, not only occasioned d civil wars in the state, but likewise several schisms in the church. The lustre of their race was finally outshone by the two great patrician families, Colonna and Orsini, whose magnificence, power, and pretension far exceeded those of the greatest citizens of Rome. Two of the last of the F. who merit mention are Giovanni, who captured Conradin of Hohenstaufen, and delivered him, in 1268, to his sanguinary enemies; and Latino, Grand Inquisitor and Cardinal and Bishop of Ostia and Velletri. The origin of the name Frangipani is attributed to the family's benevolent distribution of bread in time of famine.—The Croatian family of the same name claim descent from the great original Roman House.

FRANK, FRANKING LETTERS. On the introduction of the uniform penny-postage on all inland letters in 1840 (3 and 4 Vict. c. 96), the privilege formerly enjoyed by peers and members of the House of Commons, and many official persons, of '*franking*,' as it was called, that is, sending and receiving letters duty free, was abolished; the statute 7 Will. IV. and 1 Vict. c. 32, by which this privilege had been recently regulated, being repealed by s. 68 of the first-mentioned act. The privilege was claimed by the House of Commons in 1660, when the post-office was first legally established (see POST-OFFICE), but it was afterwards dropped upon a private assurance from the crown that it should be allowed to members. The postmaster-general accordingly constantly issued a warrant directing the allowance, till the privilege was expressly conferred by statute 4 Geo. III. c. 24. In the days of franking, each member of either House of Parliament was entitled to send ten letters every day, not exceeding an ounce in weight each, to any place in the United Kingdom, and to receive fifteen free. As it was not necessary that the letter should be either written by or to the privileged person, the privilege was greatly abused; and most persons whose memories reach back to the period when it existed, will remember family arrangements for taking advantage of it, by which the whole correspondence of the kindred, connections, and even the intimate acquaintances of a peer, or a member of parliament, was in general carried on duty free. Up to the passing of the last-mentioned statute (12th July 1837), all that was requisite was that the member should write his name or title on the corner of the letter. From this time, however, till the abolition of the privilege, it was required that the whole address should be written by the member; that he should add not only his name, but the name of the post-town, and the day of the month; and what was most troublesome of all, that the letter should be posted on the day on which it was written, or the following day, and in a post-town within 20 miles of which the person franking was then actually resident. By this cruel regulation (7 Will. IV. and 1 Vict. c. 35, s. 9), the kindly custom of giving franks to friends, or leaving them with them for future use, was rudely interfered with, and the public mind reconciled to the final abolition of what many regarded as a time-honoured abuse.

FRANKALMOIGNE (Lat. *libera eleemosyna*, free alms) was a gift of lands to those who were consecrated to the service of God. By the ancient common law of England, a man could not alien lands which came to him by descent without consent of his heir, but he might give a part to God in free alms. It was an old Saxon tenure, and continued under the Norman revolution, through the great respect that was shown to religion and religious men. This is the tenure by which almost all the ancient monasteries and religious houses held their lands, and by which the parochial clergy and

very many ecclesiastical foundations hold them at this day. The statute of 12 Car. II. c. 24, which abolished the old tenures, specially reserved tenure in frankalmoigne. The condition on which lands in frankalmoigne were held was, that masses and divine services should be said for the grantor and his heirs, but no particular service was specified. At the Reformation, the nature of the services was changed, but the tenure was suffered to continue. A tenant in frankalmoigne did no fealty to his overlord, and in the event of failure to perform the service, the latter was not entitled to distrain, but might complain to the ordinary or visitor. In this respect, this tenure differed from tenure by divine service, i. e., where lands were given on condition of performing a specified service, as saying a mass on a particular day, or distributing certain alms. In this case, the tenant was bound to render fealty, and the lord was entitled to distrain on failure to perform the service. But lands held in frankalmoigne were subject to the *trinoda necessitas*, of repairing highways, building castles, and repelling invasions. Frankalmoigne was a tenure, to be held of the grantor and his heirs; all lands, therefore, now held in frankalmoigne, unless created by the crown, must have been granted before the reign of Edward I., for by *Quia emptores*, 18 Edw. I., all grants by subjects to be held of the grantor and his heirs are ineffectual. In Scotland, lands conveyed to the church *in puram eleemosynam* were said to be mortified. See MORTIFICATION.

FRA'NKENBERG, a flourishing manufacturing town of the kingdom of Saxony, is beautifully situated on the right bank of the Zschopau, an affluent of the Mulde, 32 miles south-west of Dresden. It has manufactures of cottons (with cotton printing), linens, leather, and machinery. Pop. 7660.

FRA'NKENHAU'SEN, a small town of Germany, in the principality of Schwarzburg-Rudolstadt, stands on the Wipper, 27 miles north-north-west of Weimar. It is surrounded with walls, pierced by eight gates, has a palace, a Latin school, a productive salt-work, and a saltpetre refinery. Pop. 5000, who are engaged chiefly in the corn and wool trade, and in the production of wine. F. figures in history as the scene of a battle between the rebellious peasants under Thomas Münzer, 15th May 1525, and the Saxon, Brunswick, and Hessian troops, in which the former were defeated.

FRA'NKENSTEIN, a small but active town of Prussia, in the province of Silesia, is situated on a height on the left bank of the Pause, 37 miles south-south-east of Breslau. It is surrounded with walls which are entered by four gates, and consists of the town proper with four suburbs. Seven miles south-west of F. is the mountain fortress of Silberberg, the defences, bastions, and casemates of which are almost entirely hewn out of the solid rock. These works were constructed by Frederick the Great, in order to command the passage from Bohemia. Pop. 6198, who are engaged in the manufacture of broadcloth, linen, aquafortis, strawplait, saltpetre, &c.

FRA'NKENTHAL, a prosperous manufacturing town of Germany, in the Bavarian Palatinate, is situated on the Isenach, 16 miles north-north-west of Spires. From the town, a canal between 50 and 60 feet broad extends east to the Rhine, a distance of three miles. It has important cloth manufactures, cotton and linen weaving, and manufactures of gold and silver wire, and of needles, files, and tobacco. Pop. 5600.

FRA'NKFURT-ON-THE-MAINE (Ger. *Frankfurt am Main*), the most ancient and important of the free cities of Germany, is situated on the right bank of the Maine, in lat. 50° 6′ N., and long. 8° 40′ E. The population of the city was, according to the census of 1858, 67,975, and that of its dependent villages, 11,303, exclusively of the federal troops, which are quartered at F. as the seat of the German Diet. F. possesses a small territory (about 39 square miles), lying immediately beyond the precincts of the city, and watered by the Maine. The soil, which is deep sand covered with a substratum of lava, is admirably adapted for the growth of corn, the vine, and other fruits. F. is the centre from which radiate public roads and railways to every part of Germany; while its site on the banks of the Maine, 20 miles from its confluence with the Rhine, by affording it a direct channel of water-communication with the German Ocean, secures to it great advantages as a seat of commerce. Its central position has pointed it out from the earliest ages of the history of Germany as a suitable place for national meetings, and in 794 Charlemagne convoked a council here. In 843, F. was made the capital of the eastern Frankish empire, and continued so till 889, when Arnulf transferred that honour to Ratisbon; in 1257, F. was raised to the dignity of a free city; and in 1356, Charles IV. confirmed by the famous 'Golden Bull' the right, which it had enjoyed since the days of Frederic Barbarossa, of being the place for the election of the emperors of Germany. The Guildhall, or *Roemer*, contains the Wahlzimmer, or Hall of Election, in which the Electors (q. v.) met to deliberate on the nomination of the emperors, and the *Kaisersaal*, or Imperial Hall, in which the newly elected monarch held his public dinner, at which he was waited upon by the counts and high officers of the empire, who held their respective domains and offices in right of their performing various acts of service on that occasion. Round this hall are ranged in niches the portraits of the emperors from Conrad to Leopold II. The Golden Bull is preserved among the archives. The ancient cathedral, St Bartholomew's, contains the chapel in which the electors accepted the emperor after he had been anointed at the high-altar. F. still contains many old and narrow streets with high-gabelled projecting houses, but its ancient walls and ramparts have been converted into pleasure-walks, and there are now broad quays, and wide handsome streets in the more modernised parts of the city. The famous *Juden-gasse*, or Jews' Street, has lost its ancient characteristics since a more liberal policy has permitted members of the Jewish persuasion to live in whatever quarter they choose. The gates, which secured the street at either end, and were closed at night to prevent the egress of the Jewish inhabitants, were razed at the time of the French occupation in 1806. F. is connected with its suburb, Sachsenhausen, which lies on the left bank of the Maine, by a bridge of 14 arches, originally built about the year 1342. There are fountains in several of the squares, one of which is adorned with a fine statue of Goethe, who was born at F., and another with a group commemorative of the invention of printing. F. possesses several good public libraries, museums, and galleries, and many charitable institutions. It derives great wealth from its banking transactions; the aggregate capital of its bankers, among whom the name of the Rothschilds has long stood foremost, is said to be about 20 millions sterling, and the annual transactions in bills of exchange about 12 millions sterling. Its manufactures are snuff, tobacco, jewellery, printers' black, wax-cloths, and carpets. In 1855 it was decreed that the executive body should consist of 4 syndics and 21 members of the civic committee, with 2 burgomasters, elected annually, as its presidents, of

ıe senior draws up reports for the senate, the control of the military, while the junior over police and corporate proceedings. The · legislative chamber is composed of 57 , and the highest court of appeal is the tribunal at Lübeck. F., in conjunction : other free cities, occupies the 17th place imited council of the Diet, but enjoys an lent vote in the full council. It furnishes gent of 783 and a reserve of 336 men to r of the Confederation. The Constituent y elected in 1848 to frame a constitution ıany, held its sittings at F., which was for ırs the scene of violent political excitement; ıe greater German powers refused to accede lecisions of the assembly, no permanent ıding to the union of Germany was secured deliberations.

'KFURT-ON-THE-ODER, the capital of sive Prussian circle of the same name in the of Brandenburg, is a place of considerable n the railway line between Berlin and and about 50 miles east of the former lies in lat. 52° 22′ N., and long. 14° 20′ E. 1860, 32,800. It is a fortified, well-built d has three suburbs, one of which lies on ; bank of the Oder, and is connected with ainder of the town by a wooden bridge. ix Protestant churches, St Mary's, founded 3th c., is the most worthy of notice, for organ, richly gilt wood-carvings, and fine rindows. The university, founded in 1506, rporated in 1811 with that of Breslau, but as its distinct gymnasium, with its branch- Three great fairs are still annually held at lthough they are still attended, as of old, r Poles and Silesians, sales are less brisk ormer times. F. has manufactures of silk, gloves, tobacco, sugar, and porcelain ware ; nsiderable distilleries, and is noted for its · Its situation on a navigable river, con- y canals with the Vistula and the Elbe, great commercial and social advantages, ve rendered it a place of importance from arly period. It was a flourishing member nseatic League, and during the middle ages ed frequently at the hands of marauding It was besieged in 1430 by the Hussites, by the Poles, and in 1477 by the Duke of In the Thirty Years' War, it was frequently both parties, and at the beginning of the entury it suffered severely at the hands of ich. F. is the seat of the administrative ent, judicial tribunal, council of nobility, ds of taxation for its circle. The village rsdorf, 4½ miles from F., was the scene st battle, fought August 12, 1759, between the Great and the Russo-Austrian forces, the former, after a sanguinary engagement, elled to retreat with great loss.

'KINCENSE (*thus*), a name employed to various fragrant resinous substances which strong fragrance in burning, and are on unt used in certain religious services. There eason to believe that the frankincense of s, and also of the ancient Greeks and was chiefly or entirely the substance now *Olibanum* (q. v.), the produce of an Indian *wellia serrata* or *thurifera*. See BOSWELLIA. rmerly supposed to have been obtained from *perus Lycia*, which is now believed not to r such product, and is a native of the south e, whilst the prized frankincense of the was brought from the East.—Several trees, of different natural orders, yield substances used as frankincense instead of olibanum, in different parts of the world, as several species of *Icica* and of *Croton* in America; and the silver fir (see FIR) in Europe, the resinous product of which is the COMMON FRANKINCENSE of the pharmacopœias, although in the shops, concrete American turpentine is very often sold under this name. It is used in the composition of stimulating plasters, &c. *Burgundy pitch* is made from it. It is a spontaneous exudation from the tree, hardening by exposure to the air, and generally of a whitish or pinkish colour, with a rather agreeable odour and a balsamic taste.

FRA'NKLIN. The franklin, or, according to the old spelling, the frankelein, was the English freeholder of former times, who held his lands of the crown, free (frank) from any feudal servitude to a subject-superior. Chaucer's *Franklin's Tale*, and still more his description of the franklin in the prologue to his immortal Pilgrimage, have rendered him a classical character. In the whole circle of our literature there is probably no more perfect picture of the person, habits, and surroundings of a jovial old country gentleman. His beard was white as a daisy, his complexion sanguine, he loved a 'sop in wine,' and woe to his cook if his sauce were not poignant and sharp; in a word, 'he was Epicurus' owen son.' But the franklin's luxuries were not intended for his own enjoyment alone, for 'a householder, and that a great, was he.' His table stood 'in his hall alway,' 'ready covered all the longe day;' and

> Withouten baked meat never was his house,
> Of fish and flesh, and that so plenteous,
> *It snowed in his house of meat and drink.*

Nor was it only in dispensing good cheer that the franklin fulfilled the functions of the country gentleman of his day. At sessions, he was 'lord and sire,' and full often time he had been 'knight of the shire.' He had been sheriff too, and a countour and vavasour; though what these latter offices were, is a subject of controversy amongst the commentators. 'The dress of the franklin, according to the Duke of Sutherland's MS.,' says Mr Saunders, in his excellent little book called *Cabinet Pictures of English Life* (p. 204), was a surcoat of red lined with blue, with bars or stripes of fringe or lace over it. He wore a small blue hat turned up, and black boots.' Chaucer adds to his attire a knife or dagger called an 'anelace,' and a 'gipciere' or silk purse, 'white as morrow [morning] milk,' at his girdle. Mr Saunders mentions (*ut sup.*) that in the Metrical Chronicle of Robert de Brune, the franklin of an earlier period (13th c.) is ranked immediately after earls, barons, and lords, and was evidently a person of great consideration. Such, as we have seen, was very much his position in Chaucer's time, but he seems to have fallen in dignity, and we find him in much lower company in Shakspeare's day. In *The Winter's Tale* the clown is made to say (Act v. scene 2):

> Not swear it, now I am a gentleman
> Let boors and franklins say it, I'll swear it.

From other passages it would seem that his position had come to correspond to that of the well-to-do yeoman. In 1 Henry IV., Act ii. scene 1, we hear of a franklin 'in the wold of Kent hath brought three hundred marks with him in gold;' and *Cymbeline* says (Act iii. scene 2), 'Provide me presently a riding suit, no costlier than is fit a franklin's housewife.' There seems no reason to think, however, that Dr Johnson's remark that franklin is 'not improperly Englished a gentleman servant,' is warranted by his position at any period, and it certainly

is not by the passage which he quotes from the *Fairy Queen:*

> A spacious court they see, &c.,
> Where them does meet a franklin fair and free.

FRANKLIN, BENJAMIN, an eminent American philosopher and statesman, born at Boston, in Massachusetts, the 17th of January 1706. He was the youngest son and fifteenth child out of a family of seventeen children. His father, Josiah Franklin, emigrated from England to America in 1682: he followed the business of tallow-chandler and soap-boiler. Benjamin, when only ten years old, was employed in his father's shop in cutting wicks, going errands, &c.; but becoming soon disgusted with the monotonous routine of his duties, he conceived a strong desire to go to sea. To prevent this, his father bound him apprentice to his brother James, who was a printer. Young F. had now free access to books, for which he had evinced a fondness even from infancy. He himself says he could not remember the time when he did not know how to read. To gratify his thirst for reading, he would often sit up the greater part of the night. He did not, however, neglect his duties as printer, and he became in a few years well skilled in his trade. But the two brothers could not agree. The elder appears to have been of a severe and passionate temper, which the younger, as he himself intimates, may have sometimes provoked by his impertinence. At length, when seventeen years of age, young F. left Boston without the knowledge of his relations, embarking in a vessel bound for New York, whence he proceeded, partly by water, and partly on foot, to Philadelphia. Here he obtained employment as a journeyman printer. In the following year, encouraged by the promise of assistance from a gentleman in Philadelphia, he resolved to set up business for himself. With this view, he went to England, in order to purchase type and other materials necessary for carrying on his trade. But failing to receive the aid which he had expected from his pretended friend, he was obliged to work as a journeyman in London, where he remained more than a year. He returned in 1726 to Philadelphia, and in 1729, with the assistance of some friends, established himself in business. The next year he married Miss Deborah Read, with whom he had become acquainted in Philadelphia before he went to England. In 1729, F. had become the proprietor and editor of a newspaper (*The Pennsylvania Gazette*), which his talent for writing soon rendered very popular and very profitable. In 1732, he commenced the publication of an almanac, purporting to be by Richard Saunders. He sought to make his almanac, like his paper, the vehicle of useful information for the people, especially inculcating the virtues of frugality, industry, &c. It was commonly called *Poor Richard's Almanac*, under which name it acquired a wide celebrity.

By his talents, prudence, and integrity, F. continued to rise in the estimation of the community in which he lived, until he was deemed worthy of the highest honours which his country could bestow. He was made successively clerk of the Assembly of Pennsylvania (1736), Postmaster of Philadelphia (1737), and Deputy Postmaster-general for the British Colonies (1753). A dispute having arisen between the Assembly and the proprietary governors, in consequence of the latter claiming exemption from taxation, F. was sent in 1757 to England to plead the cause of the people before the privy council. His representations and arguments prevailed, and it was decided that the estates of the proprietaries should bear their due proportion of the public burdens. On his return in 1762, he received the thanks of the Assembly for the able and faithful fulfilment of his mission.

F. had already become distinguished in the scientific world by his successful experiments on the nature of electricity. In 1752, he had made the important and brilliant discovery of the identity of lightning with the electric fluid. Soon after, the Royal Society of London, even without waiting for any application to be made on his behalf—which had been the general usage—chose him a member of their body, and bestowed upon him the Copley gold medal. Alluding to F.'s account of his electrical experiments, Sir Humphry Davy observes: 'A singular felicity of induction guided all his researches, and by very small means he established very grand truths. The style and manner of his publication are almost as worthy of admiration as the doctrines it contains. . . . . He has written equally for the uninitiated and for the philosopher.'

In 1764, F. was again sent by the Assembly as agent to England. The policy of taxing the colonies had already been agitated, and he was instructed by the Assembly to use his efforts against such a measure. But the ministry had formed their plans, and the Stamp Act was passed early in 1765. It caused a great excitement, and met with the most determined opposition in America. At the beginning of 1766, a new ministry having come into power, the subject was again brought to the attention of parliament. F. was examined before the House of Commons, on which occasion his talents, his varied information, and his presence of mind, were shewn to great advantage, and the repeal of the obnoxious Stamp Act was the result. But other laws deemed equally objectionable remained in force. In the dispute between the American colonies and the mother-country, F. had sought sincerely and earnestly to prevent a disruption; when, however, he became convinced that a separation was inevitable, he returned home, and took an active part in promoting the cause of independence. He arrived at Philadelphia on the 5th of May 1775, after an absence of rather more than ten years. The day after his arrival, he was unanimously elected by the Assembly of Pennsylvania a delegate to the Second Continental Congress then about to assemble. He was one of the committee of five chosen by congress to prepare the celebrated 'Declaration of Independence,' which, having been unanimously agreed to on the 4th of July 1776, he afterwards signed with the other leading patriots. Towards the close of the same year, he was sent as ambassador to the French court. To him is due the principal, if not the sole, credit of effecting between France and the United States the Treaty of Alliance, the stipulations of which were so eminently favourable to the latter country. This treaty, signed at Paris the 6th of February 1778, may be said to have secured the independence of the American colonies. F. remained in Europe some time after the establishment of peace. In 1785, he returned to Philadelphia, where he died on the 17th of April 1790, aged 84 years.

In person, F. was of a medium stature, well formed, and strongly built, with a light complexion, and gray eyes. His manners were affable and engaging. He was remarkable for simplicity of character, and practical common sense. He deemed nothing which concerned the interest or happiness of mankind unworthy of his attention, and rarely if ever bestowed his attention on any subject without obtaining permanently useful results.

He left among his numerous works an extremely interesting and instructive autobiography of the earlier portion of his life, extending to his fifty second year. A complete collection of his works,

by Jared Sparks, has been published in ten
s octavo.
F.'s living posterity, there is none bearing his

ANKLIN, REAR-ADMIRAL SIR JOHN, an
naval officer of distinguished reputation,
rn at Spilsby, in Lincolnshire, April 16, 1786.
s descended from a long line of freeholders,
s the youngest son of a respectable yeoman.
eived the rudiments of his education at St
afterwards he spent two years at the gram-
hool of Louth. It is stated that he was
d for the church, but as he displayed a
l predilection for the sea, his father wisely
ned opposition to his choice of a profession,
ocured him, in 1800, a midshipman's post on
the *Polyphemus* line-of-battle ship. In the
ng year, F.'s ship led the van in the desperate
of Copenhagen. Two months after, he was
d to the *Investigator*, then fitting out under
nd of Captain Flinders, for discovery and
of the Australian coast. In this expedition,
l the companionship of the distinguished
t Robert Brown, and of his coadjutor Ferdi-
Bauer, and from them he learned the great
ance of the natural sciences, in the promotion
ch he ever afterwards took a deep and
ent interest. On his return to England,
appointed to the *Bellerophon*, in which
d as signal midshipman in the battle of
ar (1805), and had the good-fortune to
unhurt. He subsequently served in the
l on various stations, and took a distin-
part in the attack on New Orleans in 1814.
, F. was despatched by government to Hud-
ay, with orders to make his way thence to
ctic Sea, and survey as much of the coast
ble. In the course of this expedition, which
about three years and a half, F. travelled
iles under circumstances of the greatest
p and privation, to which more than half
companions succumbed. But the gain to
was great, alike from the carefulness and
of the physical surveys of the month of
permine River, and eastward along Corona-
ulf, and from the attention devoted to the
productions of these inclement shores. On
rn, in 1822, F. was made post-captain, and
a Fellow of the Royal Society. In 1825,
perated (overland) with the sea-expeditions
ains Parry and Beechey, and surveyed the
American coast from the mouth of the
nine westward to about Point Beechey. F.'s
ries now extended over 44 degrees of longi-
more than a third of the distance between
Bay and Behring's Strait. For these valu-
plorations, in which he was engaged until
e received the honour of knighthood from
ereign, and the degree of D.C.L. from the
ity of Oxford, while the French Geographical
awarded him their gold medal, and at a
ent period he was elected corresponding
of the Institute of France. F. next took
e part in the Greek war of liberation. In
e was appointed governor of Van Diemen's
rhere his wise and moderate conduct secured
the warm approbation both of the govern-
nd the colonists. The latter established a
and a philosophical society in his honour;
rs after, they testified that the memory of
e was still gratefully cherished, by sub-
£1600 towards an expedition designed for
ue. In May 1845, F., now bordering on his
ar, but with physical and mental powers
undiminished in vigour, started with the *Erebus* and *Terror* on his last and ill-fated expedition to discover the North-west Passage. The last time that the vessels were seen was in July of the same year. To enter into the history of the efforts undertaken for the relief or discovery of the fate of F. would be out of place here. It is sufficient to say, that in the course of eleven years upwards of twenty separate expeditions, at the cost of about a million sterling, were sent out to look for the missing crews; and the discoveries of these expeditions added more to our knowledge of the arctic regions than all previous explorations had done. See NORTH-WEST PASSAGE. It was not until 1859 that the fate of F. was ascertained by the commander of a little vessel fitted out by Lady Franklin, after hope had been declared hopeless by all else. It then appeared that F. had died on the 11th June 1847, fortunately before his sympathetic heart had been lacerated by witnessing the awful sufferings of his men. F. was one of the boldest and most persevering explorers that Britain ever sent from her shores. His daring was qualified by judgment, and his sense of duty and responsibility as to the lives of those under his charge was of the keenest. His heart was tender as a woman's; and altogether he was one of the noblest types of a true Christian gentleman.

FRANKLIN, JANE, LADY, the second wife of Sir John F., to whose unwearied energy, devotion, and hopefulness, when hope had sunk in all other hearts, we are indebted for the knowledge of the fate of her gallant husband, is the daughter of John Griffen, Esq., of Bedford Place, London, and was married to Sir John Franklin in November 1826. In 1848, when, owing to the long absence of news about the expedition of the *Erebus* and *Terror*, fears began to be entertained about its safety, Lady F. offered large rewards to any persons who should discover and afford relief to the missing voyagers, or who would make exertions with that end in view. From that time until 1857, when she fitted out the *Fox*, under the command of M'Clintock, whose discoveries set all doubts about the fate of her husband's expedition at rest, Lady F. never rested in her efforts to incite by voice, pen, and purse, not only her own countrymen, but Americans, to search for the missing ships and their unfortunate crews. Lady F. is still alive (1862).

FRA'NKMARRIAGE (*liberum maritagium*) was a species of estate tail existing by the common law of England; for where a man, on the marriage of his daughter or cousin, gave lands to be held in frankmarriage, this implied a gift in special tail, to the donees and heirs of their bodies. This tenure was called *liberum maritagium*, to distinguish it from other species of estates tail (*Co. Litt.* 94 b). Four things were necessary to a gift in frankmarriage: 1. That it must be in consideration of a marriage, but it might be as well after as before a marriage. 2. That the donee with whom it is given be of the blood of the donor. 3. That the donees should hold of the donor. Hence a gift in frankmarriage by a subject became impossible after the statute of *Quia emptores*. 4. That the donees should hold for four generations. Therefore a gift in frankmarriage with a reservation of a remainder to a stranger, or a devise by will, was bad.

FRANK-PLEDGE, a law prevailing in England before the Norman Conquest, whereby the members of every tything were responsible for the good-conduct of each other. This responsibility, according to Mr Hallam, consisted in every ten men in a village being answerable each for the others, so that if one committed an offence, the other nine were liable for his appearance to make

reparation. Should the offender abscond, the tything, if unable to clear themselves from participation in the crime, were compelled to make good the penalty. This law has been ascribed to Alfred the Great; but it would appear to have been in existence at a much earlier period. Mr Hallam, *Middle Ages*, ii. p. 80 (edit. 1841), observes: 'The peculiar system of frank-pledges seems to have passed through the following very gradual stages. At first, an accused person was bound to find bail for standing his trial. At a subsequent period, his relations were called upon to become securities for payment of the compensation and other fines to which he was liable; they were even subject to be imprisoned until payment was made, and this imprisonment was commutable for a certain sum in money. The next usage was to make people already convicted, or of suspicious repute, give securities for their good-behaviour. It is not till the reign of Edgar that we find the first general law, which places every man in the condition of the guilty or suspected, and compels him to find a surety who shall be responsible for his appearance when judicially summoned. This is perpetually repeated and enforced in later statutes during his reign and that of Ethelred. Finally, the laws of Canute declare the necessity of belonging to some hundred and tything, as well as of providing sureties.'

The *Court of Frank-pledge*, or *Court-leet*, is a court of record held once in the year, and not oftener, within a particular hundred, lordship, or manor, before the steward of the leet: being the king's court granted by charter to the lords of those hundreds or manors. All freeholders resident in the jurisdiction are bound to attend this court; but persons under twelve and over sixty years of age are excused, and by the statute of Marlbridge, 52 Hen. III. c. 10, all prelates, peers, and clergymen, and women are discharged from attendance. It was also the custom to summon all the king's subjects to this court, on attaining years of discretion, to take the oath of allegiance. The business of this court was to present by jury all crimes committed within their jurisdiction, and to punish all trivial misdemeanours. This court has practically fallen into desuetude, and the business is discharged by the justices of the peace at general and petty sessions. See Blackstone's *Commentaries*. Originally, the business of the court of frank-pledge was confined to the taking securities or free pledges for every person within the jurisdiction; but this practice having fallen into disuse, the court gradually acquired a criminal jurisdiction, concurrent with that of the sheriff's tourn. '*Magna Charta* distinguishes between the tourns or leets of sheriffs and the view of frank-pledge; limiting the former to twice a year, and the latter to once. In the more ordinary sense, frank-pledge and leet are synonymous, as appears from the style of tourns and other leets, which in court-rolls are usually denominated *curiæ* or *visus franci plegii*. But when free pledge is used, as in Magna Charta, it should be understood in a strict and particular sense.'—*Co. Litt.* by Hargrave, 115 a, note 10.

FRANKS (i. e., freemen) was the name assumed by a confederation of German tribes that appeared on the Lower Rhine in the 3d c., and afterwards overthrew the Roman dominion in Gaul. It was only the name, however, that was new; the individual tribes composing the confederation had been known on the Rhine as early as the time of Augustus. The most important of these were the Sigambri, Chamavi, Ampsivarii, Chatti, Chattuarii, and Bructeri of the time of the first emperors. In the 3d and 4th centuries, hordes of them began to pour through the Low Countries into Gaul, until at last the country became their prey. After the middle of the 4th c., they appear divided into two groups, the Salians—either from the old Ger. *Sal*, or the river Sala (*Yssel*)—and the Ripuarians (*ripa*, the bank), the first inhabiting Holland and the Low Countries, the last on both sides of the Rhine as far up as the Main. Each group had its own laws, afterwards committed to writing (*Lex Salica* and *Lex Ripuariorum*). Like the two peoples, these laws differ little even in detail. The F. were a mobile, well-endowed race, forming in language and art the transition from the Low Germans to the High; and they compose to this day the ground of the population of the west of Germany as far as the Neckar, Main, Murg, and Lower Alsace, as well as the chief Germanic element of the population of Northern France. For the later history of the Franks, see articles CLOVIS, CARLOVINGIANS, CHARLEMAGNE, FRANCE, MEROVINGIANS, &c.

FRA'NZENSBRUNN, or FRANZENSBAD, a small village and well-known bathing-place in Austria, on the north-western frontier of Bohemia, three miles north-west of Eger, is situated amid low bare hills, and consists of four rectangular streets lined with trees. It has four cold mineral springs, chiefly of alkalo-saline chalybeate water, deemed highly efficacious in the cure of scrofulous complaints and diseases of the skin, and used principally for drinking, but also for bathing purposes, in which case the water is heated to a temperature of 90° to 98° F. Nearly 200,000 bottles of these waters are exported annually. F. has also mud and gas baths.

FRASCA'TI, a beautiful town about eight miles east-south-east of Rome, with a population of 5000. It stands on the lower heights of the Alban Hills, not far from the site of ancient Tusculum, which was built on a higher range of hills. Tusculum (q. v.), a town of much more ancient date than Rome, was burned and ruined by the Romans in 1191 A. D., to avenge a former victory gained by the Tusculans in 1167. Those of the inhabitants who escaped the fury of the conquerors, sought refuge on the slope of the hill towards Rome, constructing small huts out of the underwood or *frasche*, and hence the modern name Frascati. The chief attractions of F. are its lovely villas and salubrious air, which attract from Rome in the hot season all its noble and foreign residents, and render this resort in the Alban Hills the most fashionable *villeggiatura* in the vicinity of the Eternal City. The most splendid of these summer residences are the villas Aldobrandini, also known as Il Belvedere, from its commanding and noble prospect; those of Mondragon and Taverna of the Borghese family; the villas Pallavicini and Piccolomini.

The cathedral contains a tablet to the Cardinal of York, for many years bishop of this diocese, and another to his brother, Charles Edward, the Young Pretender, who died here in 1788.

FRASER, SIMON. See LOVAT, LORD.

FRASER RIVER, the principal stream of British Columbia, comprises in its basin the far greater part of the colony. The F. R. proper has its origin in the union of two branches, the more important of which receives its waters from a series of lakes that lie in lat. 54°—55° N., long. about 124° 50′ W., flows in a general south-east direction for 260 miles, and then unites with the other branch, which has its source near Mount Brown, in the Rocky Mountains, lat. 53° N., long. 118° 40′ W., flows north-west, and is 200 miles in length. The point of confluence is near Fort George, in lat. about 53° 25′ N., and in long. about 122° 40′ W., and hence the F. R. flows in a generally southern direction through nearly the

whole length of the colony, and after a course of about 600 miles it falls into the Gulf of Georgia between Vancouver's Island and the mainland, barely to the north of the international boundary of 49° of latitude. Its chief affluents are the Stuart and the Chilcotin on the right, and the Thompson on the left. Between the Stuart and the Chilcotin, and on the same side, the F. R. is joined by an affluent, which is rather of historical interest than of physical importance—the West Road River, which took its name from its having been ascended by Sir Alexander Mackenzie, on his adventurous journey of 1793 from the Hudson's Bay Territories to the Pacific Ocean. The F. R. is practicable for steam-boats as far up as Fort Hope, a distance of about 150 miles from its mouth, while about half that distance, as far as New Westminster, it is navigable for large ships. Above Fort Hope, all intercourse is more safely and conveniently conducted by land; and even the aborigines, as their trails still testify, appear to have yielded to the same necessity.

In 1857, the F. R., in its auriferous diggings and washings, began to stand forth as the rival of California and Australia. Since then, the discoveries, originally confined to the lower basin, have steadily become at once more extensive and more productive. Eastward on the Thompson, and more especially northward among the upper waters of the great artery of the country, the precious deposit has given out almost fabulous returns. An apparently authentic communication, dated towards the close of October 1861, regards the daily earnings of £20 for one miner 'as poor this year,' and adds that, even as a hired labourer, a man gets £2 a day. On the practical value of the gold-fields, the peculiar character of the F. R. exercises in various ways a powerful influence. Besides affording comparatively few and scanty facilities for transport, whether upwards or downwards, it directly embarrasses the workings themselves. Generally speaking, the bed is a mere ravine, which rather drains than waters whatever lies beyond its wall-like banks. For operations on the high ground, therefore, the current is rarely, if ever, available; and even the inner margins, flooded, as they periodically are, by the melting of the northern snows, are accessible during only half the year.

FRA'SERA, a genus of plants of the natural order *Gentianeæ*, with a 4-partite calyx and corolla, 4 stamens, and a 2-valvular capsule. *F. Walteri*, a native of Carolina, Virginia, and great part of the basins of the Ohio and Mississippi, is often called American Calumba, the root being imported into Europe under that name. It is a pure and valuable bitter, similar in its effects to gentian. The stem is herbaceous, erect, 3—6 feet high; the leaves oval, oblong, opposite and whorled; the flowers greenish yellow. The plant is a biennial. It grows in marshy places.

FRA'SERBURGH, a burgh of barony and regality and seaport on the north coast of Aberdeenshire, 42 miles north of Aberdeen. It stands on the north-west side of a bay two miles in depth immediately south of Kinnaird's Head (supposed to be the *Taixalorum Promontorium* of the Romans), on which is the Wine Tower, an old castle with a cave below. The town, originally called Faithly, was made a burgh of barony by Queen Mary in 1565. Its name was changed into Fraserburgh (in honour of its proprietor, Sir Alexander Fraser of Philorth) by King James VI. in 1592; and the same king, in 1601, erected it into a free port, free burgh of barony, and free regality. The streets are wide and clean, with substantial houses. Pop. in 1861, 3501, annually increased by 1200 during the herring-fishing in July and August. It is possessed of one of the best harbours on the east coast, erected at a cost of £50,000. The chief exports are oats, barley, meal, potatoes, cured herrings, and coal. At the west end of the town is a quadrangular building of three stories, designed as a college by Sir Alexander Fraser, who in 1592 had obtained a crown-charter for the institution of a college and university; but although the charter was ratified by parliament in 1597, and renewed and enlarged by the crown in 1601, the plan was never carried out. F. has a handsome cross and town-house in the principal square, a spacious hall belonging to the Harbour Commissioners, and several recently erected public buildings.

FRASIER, a strawberry flower, is used by Scotch heraldic writers as synonymous with a cinquefoil; as in blazoning the coat of the Frasers, *Azure three frasers* (Nisbet, i. p. 388).

FRATE'RCULA. See PUFFIN.

FRATICE'LLIANS, or **FRATICELLI** ('Little Brethren'), a sect of the middle ages, which may be regarded as an embodiment, outside of the medieval church, of the same spirit to which is due, within the church, the Franciscan order with its many offshoots. The Italian word *Fraticelli* originally was the popular name of the Franciscan monks; but, in the progress of the disputes which arose in the order (see FRANCISCANS), the name was specially attached to the members of the rigorist party, and eventually to those among them who pertinaciously refused to accept the pontifical explanations of the monastic rule, and, in the end, threw off all subjection to the authority of the church. Several of the popes, especially Gregory IX. and Nicholas III., attempted to reconcile the disputants. Pope Celestine V. granted permission to the rigorists to form for themselves a separate organisation, in which the rule of St Francis might be observed in all its primitive and literal rigour. The suppression of this order by Boniface VIII. appears to have furnished the direct occasion for the secession of the extreme party from the church. They openly resisted the authority of the pope, whom they proclaimed an apostate from the faith. The party thus formed was increased by adhesions from other sectarian bodies, as the 'Beghards' and the 'Brethren of the Free Spirit' (see FREE SPIRIT). In vain Clement V., in the council of Vienna (1311—1312), put forward a new declaration regarding the rule of St Francis. They still held their ground, especially in Sicily, Central and Northern Italy, and Provence. John XXII., against whom they sided actively with Lewis of Bavaria, condemned them by a special bull in 1317, and again in a similar document directed against Henry de Ceva, one of their chief leaders in Sicily. From these sources we learn that they regarded the existing church as in a state of apostasy, and claimed for their own community the exclusive title of the Church of God. They forbade oaths, and discountenanced marriage. They professed a divine mission for the restoration of the Gospel truth. They held that all spiritual authority was forfeited by sin on the part of the minister. It would even appear that they proceeded so far as to elect for themselves a pope, with a college of cardinals, and a regular hierarchy (Wadding, *Annal. Min. Fratrum ad an.* 1374, n. 20). Their principles, in a word, seem to have partaken largely of the same fanatical and anti-social tendencies which characterised the Brethren of the Free Spirit; and in common with them, the F. were the object of a rigorous persecution about the middle of the 14th century. The principles of

this sect formed the subject of a public discussion at Perugia in 1374 between them and a Franciscan monk named Paolucci, which appears to have ended in their discomfiture. They still maintained themselves, nevertheless, in Central Italy, down to the 15th c., when John de Capistran received a commission to labour for their conversion in the March of Ancona; but before the beginning of the following century, they seem to have disappeared altogether. See Mosheim, *De Beghardis et Beguinabus* (Lipsiæ, 1790); Milman's *Latin Christianity*, vol. v.; Witsix's *Kirchen-Lexicon*.

FRA'TTA-MAGGIO'RE, a town of Naples, six miles north-east of the city of Naples, has extensive rope-works, and furnishes great quantities of strawberries for the market of the capital. Silk-worms are here reared in great quantities. Pop. about 9000.

FRAUD. By the laws of all civilised nations fraud invalidates obligations. In order to produce this effect, however, it is necessary that the misrepresentations, or other dishonest manœuvres of the offending party, shall have induced the other to enter into the agreement or contract, and that he would not otherwise have consented. Fraud of this description on the one side produces *error in essentialibus* on the other, and where such error exists there is no consent. But as consent is of the essence of the contract, there is here no contract at all; i. e., the contract, or pretended contract, is, as lawyers say, null *ab initio*. It is not necessary that the fraud which thus gives birth to the contract shall have consisted in positive misrepresentation, or even in studied concealment; and it was well laid down in the case of an English sale, that where the purchaser laboured under a deception, in which the seller permitted him to remain, on a point which he knew to be material in enabling him to form his judgment, the contract was void. But there is another kind of fraud which, though it be not actually the cause of, is incident to, the contract, and which, though it does not annul the contract, gives rise to an action for damages or restitution by the party deceived. The distinction between these two kinds of fraud was well known to the civilians, the first species being described by them as that 'quod causam dedit contractui,' that is to say, which causes the contract; the second as that 'quod tantum in contractum incidit,' which is incident to, or accompanies the contract, but independently of which the contract would have been entered into (Voet. lib. 4, tit. 3, 3). There is another very important element to be taken into account in judging of the character, and determining the legal effects of a fraud, viz., whether it proceeded from one whose position was such as to impose upon him the obligation of making the discovery. In illustration of this principle, the following case was put by Lord Thurlow in Fox *v.* Mackreth (2 Bro. Ch. R. 420): 'Suppose that A, knowing there to be a mine on the estate of B, of which he knew B was ignorant, should enter into a contract to purchase the estate of B for the price of the estate, without considering the mine, could the court set it aside? Why not, since B was not apprised of the mine, and A was? Because A, as the buyer, was not obliged, from the nature of the contract, to make the discovery. . . . . The court will not correct a contract merely because a man of nice honour would not have entered into it; it must fall within some definition of fraud. The rule must be drawn so as not to affect the general transactions of mankind.' Neither will the commendations usually bestowed on their commodities by tradesmen be regarded as fraudulent statements, so long as they are simply extravagant in degree; but if positively at variance with facts known to them, they will not be permitted to enjoy the protection which custom has extended to ordinary 'puffing.' The same principle will yield the converse result wherever a relation of peculiar confidentiality exists between the contracting parties. Here courts of law require what is called *uberrima fides*, the fullest measure of good faith, to validate the transaction. As an illustration, may be mentioned a case in which the managing partner of a firm purchased the share of his co-partner for a sum which he knew from the accounts, of which he had the entire superintendence, to be inadequate, but the inadequacy of which he concealed. The transaction was reduced, Sir John Leach, V. C., remarking that 'the defendant being the partner whose business it was to keep the accounts of the concern, could not, in fairness, deal with the plaintiff for his share of the profits of the concern without putting him in possession of all the information which he himself had with respect to the state of the accounts between them.'—Maddeford *v.* Austwick 1 Gim. R. 89.

In addition to direct misrepresentation, and concealment in circumstances in which open dealing was a duty, fraud may be perpetrated by taking advantage of the imbecility of the party who has been led into the contract, and still more flagrantly by inducing this imbecility by intoxication or otherwise. See CONCEALMENT, ERROR, MISREPRESENTATION, CONTRACT, SALE-WARRANTY. In addition to the ordinary English sources of information, we may refer to the extensive and learned *Traité du Dol et de la Fraude*, par J. Bédarride, 3 vols. (Paris, 1852).

FRAUNHOFER, JOSEPH VON, a distinguished practical optician, was born at Straubing, in Bavaria, 6th March 1787. In 1799 he was apprenticed to a glass-cutter in Munich, and in 1806 was received, as a working optician, into the establishment of Reichenbach and Utschneider at Benedictbeurn (afterwards, in 1819, removed to Munich). While there, he acquired considerable wealth through his inventions, and soon afterwards became proprietor of the establishment. He invented a machine for polishing paraboloic surfaces, and was the first who succeeded in polishing lenses and mirrors without altering their curvature. His prisms also were celebrated, being free from the blebs and striæ which are so often seen in those of English manufacture. His inventions are numerous, and include a 'heliometer,' a 'micrometer,' an 'achromatic microscope,' besides the great parallactic telescope at Dorpat. But that which has rendered F.'s name celebrated throughout the scientific world, is his discovery of the lines in the Spectrum. He died at Munich on the 7th of June 1826.

FRAU'NHOFER'S LINES. See SPECTRUM.

FRAU'STADT (Polish, Wszowa), a town of Prussia, in the government of Posen, is situated in a sandy plain on the Silesian frontier, 55 miles north-west of Breslau. It has linen, woollen, and other manufactures, and important grain markets. In the vicinity are about 100 wind-mills. Pop. 6724.

FRAXINE'LLA. See DITTANY.

FRA'XINUS. See ASH.

FREDERI'CIA, a seaport and fortress of Denmark, is situated on the east coast of the province of Jutland, on a projecting tongue of land, at the northern entrance to the Little Belt. It is fortified with nine bastions and three ravelins on the land-side, and with two bastions towards the sea. It has several ecclesiastical edifices, a hospital, and a custom-house, at which a toll is paid by all ships

through the Little Belt. Tobacco is grown
nufactured here Pop. 5579.

DERICK (Ger. FRIEDRICH) I., OF GER-
-Frederick I., Emperor of Germany, sur-
BARBAROSSA (Redbeard), was born in 1121,
ed his father, Frederick Hohenstaufen, as
Swabia in 1147, and his uncle, Conrad III.,
eror in 1152. He was one of the most
ned and powerful rulers who ever swayed
perial sceptre. In his desire to emulate
agne, and to raise the secular power of the
in opposition to the arrogated supremacy
papal chair, he was brought into constant
with his Italian subjects. Six times he
npelled to cross the Alps at the head of
rmies, in order to chastise the refractory
Lombardy, which were ever ready, on the
t provocation, to throw off their allegiance.
early periods of his reign, he visited their
n with undue severity; but in his latter
s conduct towards them was characterised
nerous leniency and a politic liberality in
of his age; and in 1183, he convoked a
at Constance, in which he finally agreed to
ie Lombard cities the right to choose their
nicipal rulers, and to conclude treaties and
among themselves, although he retained his
ey over them, together with the power
sing certain fixed taxes. The difficulty of
the Italian differences was as usual aggra-
F.'s time by the attitude assumed by the
ts of the papal chair, and at one time Italy
tracted by the pretensions of two rival popes,
ler III. and Victor IV., who each excom-
ed the other, and hurled the anathemas
church against their several opponents; and
not till 1176 that F., after his defeat at
, by consenting to acknowledge Urban II.,
cessor of Alexander III., as the rightful pope,
abled to turn his attention to Germany. By
getic measures, he succeeded in thoroughly
ng his troublesome vassal, Henry the Lion,
f Brunswick, and thus crushing the Guelfic
in Germany. F. made Poland tributary
empire, raised Bohemia to the rank of a
n, and the mark-gradom of Austria into
ependent hereditary duchy. In 1189, F.,
settled the affairs of the empire, and pro-
universal peace in his dominions, resigned
vernment to his eldest son Henry, and,
head of 100,000 men, set forth for the Holy
accompanied by his second son, Frederick
bia, the founder of the order of Teutonic
s. After gaining two great victories over
acens at Philomelium and Iconium, he was
d (1190) in a river of Syria, while trying
his horse across the stream. His remains
ecued by his son, and buried at Tyre. The
of F., which led to the dispersion of the
ers before any material advantage had been
d over the Infidels, excited the deepest grief
many, where his memory has always been
el as that of the best and wisest of his race.
a patron of learning, and enacted many
ble laws, some of which are still in force.

DERICK II., OF GERMANY, grandson of
mer, and son of the Emperor Henry VI., and
stance, heiress of Sicily, was born in 1194.
other secured the favour of Pope Innocent
her infant son, by conceding many import-
ivileges to the papal chair; and after the
ar which had raged in Germany for eight
between the rival claimants of the throne,
of Swabia and Otho IV., was brought to
l by the agency of Innocent, F. succeeded
(1212) in obtaining the support of the German electors. On his promising to undertake a crusade, the pope sanctioned his coronation at Aix-la-Chapelle in 1215. Like his grandfather, F. was actuated by an ardent desire for the consolidation of the imperial power in Italy at the expense of the pontificate, which he wished to reduce to the rank of a mere archiepiscopal dignity. Having secured the nomination of his son Henry to the rank of king of the Romans, and appointed Archbishop Engelbert of Cologne as his vicegerent, he left Germany; and after having been crowned emperor at Rome in 1220, devoted himself to the task of organising his Italian territories. He founded the university of Naples, gave encouragement to the medical school of Salerno, invited to his court and patronised men of learning, poets, and artists, and commissioned his chancellor, Petrus de Vineis, to draw up a code of laws, to suit all classes of his German and Italian subjects. F.'s schemes for the union of his vast and widely scattered dominions were, however, frustrated by the refractory conduct of the Lombard cities, and still more by the arrogance of the popes Honorius III. and Gregory IX., who threatened him with excommunication unless he fulfilled his pledge of leading a crusade. Being compelled to depart on this expedition, he made the necessary preparations for its prosecution; but a pestilence having broken out among his troops in the Morea, he returned in haste to Italy, only to be again forced away by papal threats. This second attempted crusade proved more successful; and in 1228, notwithstanding the machinations of the pope, and the treachery of the Knights Templars, F. extorted a ten years' truce from the Moslem ruler, and forced him to give up Jerusalem and the territory around Joppa and Nazareth. The rest of his life was spent in bringing his rebellious Lombard subjects to subjection, and in counteracting the intrigues of the pope, the rebellion of his eldest son, and the treachery of his friend and minister, the Chancellor Petrus de Vineis, who was suspected of attempting to poison him. F., who died suddenly in 1250, the possessor of seven crowns, was the most accomplished sovereign of the middle ages, for he not only spoke and wrote the six languages common to his subjects, but he was famed for his talents as a minnesinger, and for his skill in all knightly exercises, while he wrote elaborate treatises on natural history and philosophy. His strong sympathies with his Italian mother-land, and his unremitting endeavours to establish a compact and all-supreme empire in Italy, were the causes, not only of his own misfortunes, but of the miseries which he brought upon the German empire, by embroiling him in costly wars abroad, and leading him to neglect the welfare and sacrifice the interests of his German subjects. FREDERICK III., OF GERMANY. - Frederick who was F. III. as Emperor of Germany, F. IV. as King of Germany, and F. V. as Duke of Austria, was born in 1415, being the son of Duke Ernst, of the Styrian branch of the house of Hapsburg. At the age of 20, he undertook an expedition to the Holy Land; and on his return, in conjunction with his factious brother, Albert the Prodigal, he assumed the government of his hereditary dominions of the Duchy of Austria, the revenues of which scarcely exceeded 16,000 marks. On the death of the Emperor Albert II., he was unanimously elected as his successor; and two years afterwards, in 1442, he was solemnly crowned

at Aix-la-Chapelle; ten years later, he received the imperial crown at the hands of the pope at Rome, and in 1453 secured the archducal title to his family. His reign was a prolonged struggle against domestic intrigues and foreign aggressions. One of his most troublesome opponents was his brother Albert, who refused to give up the provinces which he held until he had received a large sum of money; but notwithstanding these causes of annoyance, and while John Hunyades Corvinus, at the head of a Hungarian army, overran Austria, and laid siege to Vienna, and the usurper Sforza possessed himself of the imperial fief of Milan, on the extinction of the male line of the Visconti, F. remained absorbed in his own private studies, or roused himself only to attempt, by the aid of foreign mercenaries, to recover the crown-lands of which the House of Austria had been deprived. His pusillanimous subserviency to the papal chair, and his wavering policy, irritated the electors, who at one time cherished the design of deposing him and nominating George Podiebrand, king of Bohemia, to the imperial throne; while it entangled him in quarrels on account of the succession to the Palatinate, and other questions of German policy, and deprived the church in Germany of that independence from the thraldom of the papal chair which it had been the object of the Council of Basel to secure to it. The contempt in which F. was held was made apparent on the death of his ward, Ladislaus, king of Hungary and Bohemia, without children, when, notwithstanding his just pretensions to this inheritance, he was passed over, the people of the former having chosen George Podiebrand as their king, and those of the latter Matthias Corvinus. His brother Albert's death in 1463 secured him a short reprieve from internal disturbances, and gave him possession of Upper Austria; but he was repeatedly embroiled in quarrels with Podiebrand and Matthias; the latter of whom several times besieged Vienna, and finally dispossessed him of every town of importance in his hereditary domains. In the meanwhile, the Turks were suffered to push their conquests in Europe until they had advanced in 1456 to Hungary, in 1469 to Carniola, and in 1475 to Salzburg, although a vigorous opposition at the outset would easily have put a definite stop to their encroachments. On the death of Matthias, in 1490, F. recovered Austria, but he was obliged to acknowledge Prince Ladislaus of Bohemia as king of Hungary. This mortification was soon followed by his death, in 1493, after an inglorious reign of 53 years, which did nothing to advance the prosperity or progress of the empire, although the times were propitious to both. But although F. neglected the interests and duties of the imperial crown to indulge in the pursuit of his favourite studies in alchemy, astronomy, and botany, he never lost an opportunity of promoting the aggrandisement of his own family, which he very materially secured by marrying his son and successor, Maximilian, to Mary, the rich heiress of Charles the Bold of Burgundy. F. was temperate, devout, parsimonious, scrupulous about trifles, simple in his habits, pacific in his disposition, and naturally averse to exertion or excitement. From his time, the imperial dignity continued almost hereditary in the House of Austria, which has perpetuated the use of his favourite device, A. E. I. O. U., *Austriæ Est Imperare Orbi Universo.* See Æneas Sylvius, *Historia;* Coxe, *House of Austria.*

FREDERICK V., PRINCE PALATINE.—Frederick V., Electoral Prince Palatine, was born in 1596, succeeded to the Palatinate in 1610, was king of Bohemia from 1619 to 1620, and died in 1632. He married, in 1613, Elizabeth, the daughter of James VI. of Scotland and I. of England, through whose ambitious counsels he was induced to take a prominent part in the proceedings of the union of the Protestant princes of Germany, and finally, although against his own inclinations, to accept the title of king of Bohemia. His complete defeat at the battle of Prague terminated his short-lived enjoyment of the regal crown, of which he retained no other memorial but the mocking title of 'The Winter King.' Ridicule and contumely followed him wherever he went, and the rest of his life was spent in exile under the ban of the empire, and with no resources beyond those which he could obtain from the generosity of his friends. In 1623, he was declared to have forfeited his electoral title and his dominions in the Palatinate, which were conferred upon his cousin, Maximilian of Bavaria, the head of the Catholic league.

FREDERICK I., OF DENMARK, was born in 1473, and died in 1533. During the disturbed reign of his nephew, Christian II., he behaved with so much circumspection, that the choice of the nation fell upon him when the king was deposed, and he was raised to the throne in 1523. He shewed great cruelty to his unfortunate relative, whom he detained in close captivity; but he was a politic ruler. In 1527 he embraced the Lutheran faith, which he established in his dominions by the most arbitrary measures.

FREDERICK III., OF DENMARK, the son of Christian IV., was born in 1609, succeeded to the throne in 1648, and died in 1670. The wars of his father's reign had brought the country to a state of great embarrassment; and notwithstanding all his efforts to maintain peace, F. was continually embroiled in the quarrels of other nations, and during his reign Copenhagen was twice besieged by the Swedes under their warlike king, Charles Gustavus; nor was peace re-established till after the death of Charles. The reign of F. III. was rendered memorable by the change effected in the constitution, which, after having been in some degree elective, was at once changed into a hereditary and absolute monarchy by the voluntary act of the commons and clergy, who, from abhorrence of the nobility, surrendered to the crown the liberties and prerogative which they had hitherto enjoyed, and made the sovereign absolute and irresponsible.

FREDERICK V., OF DENMARK, the son and successor of Christian VI., was born in 1723, ascended the throne in 1746, and died in 1766, leaving the reputation of having been one of the best and wisest monarchs of his time. Denmark owed to him the increase of her national wealth, and the establishment of various branches of commerce and manufacture. F. established a Greenland Company, opened the American colonial trade to all his subjects, founded the military academy of Soroe, in Denmark, and caused schools to be opened at Bergen and Trondhjem, in Norway, for the instruction of the Laplanders. He established academies of painting and sculpture at Copenhagen, and sent a number of learned men—among whom was Niebuhr, the father of the historian—to travel and make explorations in the East.

FREDERICK VI., OF DENMARK, the son of Christian VII. and Caroline Matilda of England, was born in 1768, and assumed the regency of the kingdom in 1784, on account of the insanity of his father, on whose death, in 1808, he ascended the throne. In this reign, feudal serfdom was abolished, monopolies abrogated, the criminal code amended, and the slave-trade prohibited earlier than in any other country. In 1800, Denmark joined the

ne confederation formed between Russia, a, and Prussia, which led to retaliation on the England, to the seizure by that power of all vessels in British ports, and to the despatch owerful fleet, under Sir Hyde Parker and , to give efficacy to the peremptory demand e regent should withdraw from the conven- His refusal to accede to this demand was d by a fierce naval engagement, in which nish fleet was almost wholly destroyed. A was concluded on the regent's withdrawal he confederation; but in consequence of his ing to maintain an attitude of neutrality, of combining with Great Britain against on, the war was renewed in 1807 by the ance, before Copenhagen, of a British fleet, envoys, who summoned F. to enter into ance with England, and to surrender his fleet rsenals, and the castle of Cronborg, com- ng the Sound. On his refusal, Copenhagen ombarded for three days, the arsenals and destroyed, and all the shipping disabled, sunk, ied to England. This blow paralysed the l resources, and it required the exercise of liscretion on the part of the government, and ndurance on that of the people, to prevent emediable ruin of the country. Smarting the treatment which he had experienced from glish, the Danish monarch became the ally oleon, and suffered proportionally after the row of his empire. In 1814, Norway was by the allies from Denmark, and given to a. The state became bankrupt, and many passed before order could be restored to ances. Notwithstanding his autocratic ten- , F. so far yielded to the movements of the as to give his subjects, in 1831, a repre- ve council and a liberal constitution. He ecember 3, 1839.

DERICK VII., OF DENMARK, the reigning f Denmark, was born in 1808, and succeeded her, Christian VIII., in 1848. The prin- vents of his reign have been the wars and atic negotiations arising out of the revolt duchies of Holstein and Slesvig (q. v.), and xed question of the succession to Denmark and the duchies on the death of the king his uncle, the heir-presumptive, both of are childless. Notwithstanding the heavy es of the war, the finances have been con- ly augmented, and the material prosperity of ntry has increased during the present reign.

DERICK-WILLIAM, DUKE OF BRUNS- born in 1771, entered the Prussian service early age, and was actively engaged with ny during the war with France in 1792, and n 1806, and was taken prisoner with Blücher sic. On the death of his father and eldest , he would have succeeded to the dukedom, other brothers were incapacitated by disease gning, had not Napoleon put a veto on his on to power. Being resolved to take part in r against the French, he raised a free corps in ia, and threw himself into Saxony, which he owever, speedily compelled to evacuate. After al defeat of the Austrians in 1809, the duke ined to leave Germany; and with his corps 'black hussars,' and 800 infantry, he began sterly retreat. After various skirmishes, in which he defeated the Westphalian com- r Wellingerode and a picked detachment of he reached Brunswick, in the neighbourhood ch he gained a victory at Ockper over 4000 halians, commanded by General Reubel. He ossed the Weser, and having reached Elsfleth, and taken possession of a sufficient number of vessels and seamen, he embarked his troops; and finally, after stopping at Heligoland, landed in England with his men in August 1809. He was received with enthusiasm; and having entered the English service with his men, subsequently took part in the Peninsular war, where he served with distinction, receiving from the British government an allowance of £6000 a year, which he retained till his return to his own dominions in 1813. Although no prince could be more earnestly bent on securing the welfare of his subjects, his efforts failed utterly from the untimely and injudicious nature of the reforms he endeavoured to effect; while the magnitude of his military establishments, which were quite unsuited to the limited extent of his territories, excited the ill-will of his people. He joined the allied army with his hussars after the return of Napoleon from Elba, and fell gloriously while leading on his men at Quatre Bras, on the 16th of June 1815.

FREDERICK-WILLIAM, ELECTOR OF BRANDENBURG, commonly called 'the Great Elector,' was born in 1620, succeeded to the electorate in 1640, and died in 1688. On his accession, he found an empty exchequer, the towns and cities depopulated, and the whole electorate devastated by the ravages of the Swedish and Imperialist armies during the Thirty Years' War, which was not yet concluded; while a portion of his inheritance had even been confiscated by the Swedes. His first acts were to regulate the finances, and to conclude a treaty of neutrality with Sweden, which left him at leisure to devote himself to the organisation of his army, and the re-peopling of the deserted towns and villages by means of immigration. By the treaty of Westphalia, through which he lost several important places, he recovered the eastern portions of Pomerania, Hohenstein, the bishopries of Halberstadt, Minden, and Kamin, as lay-principalities, and the reversion of the archbishopric of Magdeburg. In the course of ten years he had, by the help of his generals, Derfflinger, Schomberg, and Kannenberg, created an army of 25,000 men, organised on the Swedish model; and having been constrained to enter into an alliance with Charles X., he co-operated with him in the taking of Warsaw, which was effected at the cost of a most sanguinary engagement in 1656. In return for this co-operation, F.-W. secured the emancipation of his Prussian duchy from its former dependence on Poland. The aggressions of Louis XIV. on the Rhenish frontier alarmed the elector, who induced the emperor, the king of Denmark, and the Elector of Hesse-Cassel, to enter into a league against France. The result was unfavourable to the cause of the German princes, and F.-W. was obliged to content himself with making highly disadvantageous terms. The war was soon renewed, and Brandenburg was again a prey to the incursions of the Swedes, who, at the instigation of Louis, advanced upon Berlin, laying waste everything on their march. The elector, who had taken up his winter-quarters in Franconia, hurried across the Elbe at the head of his cavalry, and having signally defeated the Swedes, drove them from his dominions. If the emperor had been true to his word, and supported him, F.-W. might have made head against the French; but being forsaken by the other German princes, and his dominions overrun by the troops of Louis, he was obliged to agree to the treaty of St Germain, by which he restored all his conquests to the Swedes, in return for the withdrawal of the French army, and the payment to him of an indemnity of 300,000 crowns. From this time forth, F.-W. devoted himself to the task of consolidating the prosperity of his dominions.

During his reign, he more than tripled the area of his territories, and by his generous reception of 20,000 French Protestants after the revocation of the Edict of Nantes, and the encouragement which he afforded to the immigration of Dutchmen and other foreigners, he augmented the population of his states, and introduced numerous industrial arts among his subjects. He founded the university at Duisburg, and the royal library at Berlin, and reorganised the universities of Frankfurt-on-the-Oder, and Königsberg, opened canals, established a system of posts, and greatly enlarged and beautified Berlin. He left a well-filled exchequer and a highly organised army. See Orlich, *Gesch. des Preuss. Staats im 17 Jahrh.* Berl. 1839.

FREDERICK III., Elector of Brandenburg, son and successor of the former, and the first king of Prussia, was born in 1657, and succeeded to the electorate of Brandenburg in 1688. He exhibited the same zeal as his father for the aggrandisement and amelioration of his dominions; but he was distinguished from him by his admiration of Louis XIV., whose pomp and luxurious display he imitated at his own court. He supported William of Orange in his attempt on England, and gave him a subsidy of 6000 men, which, under the command of Marshal Schomberg, contributed to gain the victory at the Boyne which decided the fate of James II. F. was always ready to lend troops and money to his allies; he sent 6000 of his best men to aid the Imperialists against the Turks; and although he met with the same ingratitude as his father, he succeeded, by treaties, exchanges, and purchases, in very considerably extending his territories; and after many years' negotiations, he induced the emperor to agree to the Crown Treaty,' by which, in return for permission to assume the title of King of Prussia, he bound himself to furnish certain contingents of men and money to the Imperial government. As soon as this treaty had been signed, F. hastened in mid-winter with all his family and court to Königsberg, where, on the 18th January 1701, he placed the crown on his own head. He died February 25, 1713. F. did much to embellish Berlin, where he founded the Royal Academy of Sciences, and the Academy of Painting and Sculpture, erected several churches, and laid out numerous streets. He established a court of appeal at Berlin, built the palace of Charlottenburg, and founded the university at Halle; but his actions were generally influenced by a love of display; and his vanity, together with his neglect of those who had served him, made him personally unpopular, although his patriotic love of Germany redeemed, in the eyes of his countrymen, many of his bad points.

FREDERICK-WILLIAM I., of Prussia, born in 1688, was in almost every particular the opposite of his father Frederick I. He was simple, and almost penurious in his habits, attentive to business, passionately fond of military exercises, but averse to mental cultivation, and fond of the society of the low and illiterate, while he carried to the utmost his ideas of arbitrary power and the divine right of kings. The public events of his reign were of little importance, although he was continually implicated in foreign wars, and he supported the cause of Stanislaus of Poland, and assisted Austria in her contests with France. He died in 1740. By his economy and reforms in the finances, he was able to indulge his taste for the organisation of military forces, while his childish love of tall soldiers induced him to connive at the most flagrant outrages both at home and abroad for kidnapping tall men and forcing them into his service: the result of this system was, that he left at his death a well-drilled army of 70,000 soldiers, of whom a large proportion were men of gigantic stature. What was of more consequence to his son and successor was, that his exchequer contained 9,000,000 thalers, and that his kingdom had attained an area of more than 45,000 square miles, and a population of upwards of 2,240,000. See Morgenstern, *Ueber Friedrich Wilhelm I.* (Braunsch. 1793); F. Förster, *Gesch. Friedrich-Wilhelm's I.* (Pots. 1835); Carlyle, *Hist. of Friedrich II., called Frederick the Great.*

FREDERICK II., of Prussia, surnamed 'the Great,' was the son of Frederick-William I. and the Princess Sophia-Dorothea, daughter of George I. of Great Britain, and was born in 1712. His early years were spent under the restraints of an irksome military training, and a rigid system of education. His impatience under this discipline, his taste for music and French literature, and his devotion to his mother, gave rise to dissensions between father and son, and resulted in an attempt on the part of F. to escape to the court of his uncle, George II. of England. Being seized in the act, his conduct was visited with still greater severity, and he himself was kept in close confinement, while his friend and confidant, Lieutenant Katt, was executed in his sight, after having been barbarously ill-treated by the king. According to some reports, the prince's life would have been sacrificed to the fury of his father, had not the kings of Sweden and Poland interceded in his favour. Having humbly sued for pardon, he was liberated, and allowed to retire to Ruppin, which, with the town of Rheinsberg, was bestowed upon him in 1734. Here he continued to reside till the king's death, surrounded by men of learning, and in correspondence with Voltaire, whom he especially admired, and other philosophers; but on his accession to the throne in 1740, he laid aside these peaceful pursuits, and at once gave evidence of his talents as a legislator, and his determination to take an active share in the political and warlike movements of the age. His first military exploit was to gain a victory at Mollwitz over the Austrians, in 1741, which nearly decided the fate of Silesia, and secured to Prussia the alliance of France and Bohemia. Another victory over the Empress Maria Theresa's troops made him master of Upper and Lower Silesia, and closed the first Silesian war. The second Silesian war, which ended in 1745, from which F. retired with augmented territories and the reputation of being one of the first commanders of the age, was followed by a peace of eleven years, which he devoted to the improvement of the various departments of government, and of the nation generally, to the organisation of his army, and the indulgence of his literary tastes. The third Silesian war, or 'the Seven Years' War,' was begun in 1756 by the invasion of Saxony—a step to which F. was driven by the fear that he was to be deprived of Silesia by the allied confederation of France, Austria, Saxony, and Russia. This contest, which was one of the most remarkable of modern times, secured to F. a decided influence in the affairs of Europe generally, as the natural result of the pre-eminent genius which he had shewn both under defeat and victory; but although this war crippled the powers of all engaged in it, it left the balance of European politics unchanged. It required all the skill and inventive genius of F. to repair the evils which his country had suffered by the war. In 1772 he shared in the partition of Poland, and obtained as his portion all Polish Prussia and a part of Great Poland; and by the treaty of Teschen, in 1779, Austria was obliged to consent to the union of the Franconian provinces with Prussia, and he was thus enabled to leave to his nephew and successor a powerful and well-organised kingdom, one-half

area than it had been at his own accession, ull treasury, and an army of 200,000 men. at the château of Sans Souci, August 17, rederick the Great is said to have 'inherited ther's excellences and none of his defects.' age, fertility of resource, and indomitable n. cannot be too highly praised. Not the nderful of his achievements was his con- o carry on his bloody campaigns without a penny of debt. A true spirit of self- —though not, perhaps, for the highest ends— im. Never was king more liberal towards ects. In Silesia, where war had nearly the inhabitants, he once remitted the six months, and in Pomerania and New burg for two years, while his government ied on with rigid economy, such as Europe er before witnessed. But not only was rnment economical, it was essentially just. persecution was unknown, civil order ere prevailed; property was secure, and the s free. On the other hand, F.'s faults were being few. Education had made him n all his ideas and prejudices; and in those be French was to be sceptical. He was unconscious of the grand intellectual and life that was about to spring up in Ger- nd to make it again the guiding-star of as it had been in the days of Luther. He act, almost ignorant of his native language, moreover, he despised as semi-barbaric; efore his death Goethe had published his *Berlichingen*, *Sorrows of Werther*, *Iphigenia s*, and many of his finest lyrics; while Kant, a variety of lesser works, had also given orld his master-piece, the *Critique of Pure* The new literature was essentially one of id aspiration, and therefore alien to the es of the royal disciple of Voltaire, who had rom his master to cherish at once contempt icion of his fellow-creatures. This disagree- ure of his character increased with years. red the citizen class to be destitute alike of id honour, and relied not on the love of the ut on his army and purse. F. was a very us writer. Of his numerous works, all of re written in French, his *Mémoires pour l'Histoire de Brandenbourg*, and *Histoire de e de Sept Ans*, exhibit perhaps the greatest f description, but all evince talent of no order. The Academy of Berlin, by the of Frederick-William IV., brought out dition of his collected works in octavo to, 1846–1851. Frederick left no children, succeeded by his nephew, Frederick-William Carlyle, *History of Frederick II.*; Pagenel, *de F. le Grand* (Par. 1830); Rödel, *Preussisch. Koenigsh.* (Berl. 1861).

DERICK-WILLIAM II., OF PRUSSIA, was 1744, and died in 1797. After a prolonged ment between his uncle and himself, he the good-will of the king by his valour ar of the Bavarian succession in 1778; but he succeeded to a well-consolidated power verflowing treasury, he had not the capacity ain his favourable position. Futile or hastily ten wars wasted his resources; so that at his stead of the overplus of 70,000,000 talers d been bequeathed to him, the state was d with a debt of 22,000,000. His predilec unworthy favourites, the establishment of a nsorship of the press, and the introduction gent ecclesiastic enactments, alienated the s of the people from him, although his mildness of disposition had excited the san- pes of the nation on his accession. F.-W. shared in the second partition of Poland in 1793, and thus gained a considerable addition to his kingdom, which, by purchase, inheritance, and other means, was augmented during his reign by the acquisition of more than 46,000 square miles of territory, and 2½ millions of inhabitants. The chief internal improvements in this reign were the introduction of a new code of laws, and a less onerous mode of raising the taxes.

FREDERICK-WILLIAM III., OF PRUSSIA, the son of Frederick-William II., was born in 1770. He early took part in the administration, and, on his accession in 1797, he at once dismissed the unworthy favourites of the preceding reign, and accompanied by his beautiful young queen, Louisa of Mecklenburg-Strelitz, made a tour of inspection through the numerous provinces of his kingdom, with a view of investigating their condition, and contributing to their local and general improvement. But although F.-W. was well intentioned, and in his moral and domestic relations his conduct was exemplary, he lacked the dignity and force of will to cope with the difficulties of his position. By his efforts to maintain an attitude of neutrality in the great European struggle that had been excited by the wars and victories of the French, he awakened the distrust of all the great anti-Gallican powers of Europe, and disappointed the petty German princes, who had looked upon Prussia as their protectress against foreign encroachments. Napoleon's promises of support and friendly intentions soon changed this neutrality to an alliance with France, and for some time Prussia persevered in her dishonourable and self-seeking policy, which was rewarded by the acquisition of Hildesheim, Paderborn, and Münster, which added nearly 4000 square miles of territory, and half a million of inhabitants to the kingdom; but at length the repeated and systematic insults of Napoleon, who despised F.-W. while he professed to treat him as a friend, roused the spirit of the nation, and the king saw himself obliged, in 1805, to agree to a convention with Russia, the real object of which was to drive Napoleon out of Germany. Again the treachery of Prussia led her to make a new treaty with France, by which she consented to receive the electorate of Hanover, and thus involved herself in a war with England. The insults of Napoleon were redoubled after this fresh proof of F.-W.'s indecision. The Prussian nation, headed by the queen, now called loudly for war, and at the close of 1806, the king yielded to these appeals. Hostilities began without further delay; but the defeat of the Prussians at Jena, Eylau, and Friedland, compelled their unfortunate monarch to sue for peace. The Prussian army was annihilated, and the whole of the kingdom, with the exception of a few fortified places, remained in the power of the French. By the intervention of the Emperor Alexander of Russia, a peace was concluded, known as the Treaty of Tilsit, by which F.-W. lost the greater part of his realm, and was deprived of all but the semblance of royalty; but although for the next five years he was a mere tool in the hands of Napoleon, who seized every opportunity of humbling and irritating him, his spirit was not subdued, and his unremitting efforts at this period of his life to reorganise his enfeebled government by self-sacrifices of every kind, endeared him greatly to his people. The disastrous termination of Napoleon's Russian campaign was the turning-point in the fortunes of Prussia; for although the French emperor was victorious over the Prussians and Russians in the battles of Lützen and Bautzen, which were fought soon after the declaration of war which F.-W. had made against France, to the

great joy of his people, in 1813, the allies were soon able to renew hostilities, which were carried on with signal success, until they finally culminated in the great battle of Leipsic, in which the Prussians, under their general, Blücher, earned the greatest share of glory. The Peace of Vienna restored to Prussia almost all her former possessions, while the part taken by the Prussian army under Blücher in gaining the victory of Waterloo, by which Napoleon's power was finally broken, raised the kingdom from its abasement. From that time, F.-W. devoted himself to the improvement of his exhausted states; but although before the French revolution of 1830 Prussia had recovered her old position in regard to material prosperity at home and political consideration abroad, the king adhered too strictly to the old German ideas of absolutism, to grant his people more than the smallest possible amount of political liberty. He had indeed promised to establish a representative constitution for the whole kingdom, but this promise he wholly repudiated when reminded of it, and merely established the *Landstände*, or Provincial Estates, a local institution, devoid of all effective power. His support of the Russian government in its sanguinary methods of crushing revolutionary tendencies in Poland, shewed his absolute tendencies, and his dread of liberal principles. F.-W. was more than once embroiled with the pope, on account of his violation of the concordat. He concluded the great German commercial league known as the *Zollverein* (see GERMANY), which organised the German customs and duties in accordance with one uniform system. He died in 1840.

FREDERICK-WILLIAM IV., OF PRUSSIA, son of the foregoing, was born October 15, 1795. He had been carefully educated, was fond of the society of learned men, and was a liberal patron of art and literature. He exhibited much of his father's vacillation and instability of purpose; and although he began his reign (June 7, 1840) by granting minor reforms, and promising radical changes of a liberal character, he always, on one plea or other, evaded the fulfilment of these pledges. He was possessed by high but vague ideas of 'the Christian state,' and shewed through life a strong tendency to mystic pietism. The one idea to which he adhered with constancy was that of a union of all Germany into one great body, of which he offered himself to be the guide and head. He encouraged the duchies of Holstein and Slesvig in their insurrectionary movement, and sent troops to assist them against Denmark; but he soon abandoned their cause, and being displeased with the revolutionary character of the Frankfurt Diet, refused to accept the imperial crown which it offered him. The conspiracies in Prussian Poland were suppressed with much rigour; and the popular movement which followed the French revolution of 1848, was at first met by the king with resolute opposition; but when the people persisted in demanding the removal of the troops from the capital, and enforced their demand by storming the arsenal, and seizing on the palace of the Prince of Prussia (the present king), who was at that time especially obnoxious to the liberals, he was obliged to comply with their wishes. Constituent assemblies were convoked, only to be dissolved when the king recovered his former security of power, and new constitutions were framed and sworn to, and finally modified or withdrawn. After the complete termination of the revolution in Germany, the revolutionary members of the Assembly of 1848 were prosecuted and treated with severity, the obnoxious 'pietistic' party and the nobility were reinstated in their former influence at court, and the freedom of the press and of religious and political opinion, was strictly circumscribed. T life of the king was twice attempted; first 1847 by a dismissed burgomaster, named Tschec and secondly, in 1850, by an insane dischar soldier of the name of Sefeloge. In 1857, F.- was seized with remittent attacks of insanity; a in 1858 he resigned the management of pub affairs to his brother and next heir, who acted regent of the kingdom till his own accession, 1860, as William I. F.-W. died in 1861.

FRE'DERICTON, the political capital of Ne Brunswick, in British North America, stands on th right bank of the St John, the largest river in th province. It is 56 miles to the north-west of th principal seaport, which bears the name of the strea above mentioned, and it is itself accessible to vesse of 50 tons. The population is about 6000. In addi tion to the public buildings, which F. possesses a the seat of government, it contains the universit of King's College, which, independently of othe resources, receives from the legislature an annua grant of £2000.

FRE'DERIKSHALD, a fortified seaport of Nor way, in the department (amt) of Smalenen, stands o an inlet called Swinesund, near the Swedish border about 60 miles south-south-east of Christiania. I is beautifully situated, and is a neat, well-buil town, with several handsome edifices. Its harbou is excellent; in it the largest vessels may be safel moored. F. largely exports deals and lobster Pop. 7408. To the south-east of the town stand the fortress of Frederiksteen, on a perpendicula rock 400 feet high. This fortress, though ofte assaulted, has never yet been taken. While layin siege to Frederiksteen, Charles XII. of Sweden wa killed, 1718; in commemoration of which event a obelisk was raised, in 1814, upon the spot where h fell.

FREE BENCH (*Francus Bancus*). By custo of certain manors in England, a widow was entitle to dower out of the lands which were held by h husband in Socage (q. v.). In some places, the widow had the whole, or the half, and the like *dum sola casta viserit* (Co. Litt. 110, b). This right is calle *francus bancus*, to distinguish it from other dower for that it cometh freely, without any act of th husband's or assignment of the heir (Co. Litt. 94, b See DOWER. A widow who has forfeited her fr bench is, by the custom of some manors, permitte to recover her right. At East and West Enborn in the county of Berks, and also in the manor Chadleworth, in the same county, and at Torr, Devon, if the widow commit incontinency, she fo feits her estate; yet if she will come into the cou of the manor riding backward on a black ram, wit his tail in her hand, and will repeat certain vers (more remarkable for their plainness than the delicacy), the steward is bound by the custom admit her to her free bench (Cowel's *Interprete* ed. 1727, fol.).

FREE CHURCH OF SCOTLAND, the nam assumed by those who at the 'Disruption' of th Established Church of Scotland, in 1843, withdre from connection with the state, and formed them selves into a distinct religious community, at th same time claiming to represent the historic churc of Scotland, as maintaining the principles for whic it has contended since the Reformation.

(It is proper to state that, in accordance with method adopted in other cases also in this work, th present article is written by a member of the churc to which it relates, and is an attempt to exhibit th view of its principles and position generally take by those within its own pale.)

There is no difference between the F. C. of S. a

stablished Church in the standards which they re; and all the laws of the church existing in force prior to the Disruption, are acknowd as still binding in the one as much as in the , except in so far as they may since have been led. The same Presbyterian constitution subin both churches, with the same classes of bearers and gradations of church-courts. The indeed, professes to maintain this constitution hurch-government in a perfection impossible in esent circumstances of the Established Church, se of acts of parliament by which the Estab- Church is trammelled, and interventions of uthority to which it is liable. And the whole ence between the F. C. and the Established h relates to the consent and submission of the lished Church to this control of the civil power ings which the F. C. regards as belonging not e province of civil government, but to the h of Christ and to its office-bearers and courts, iving authority from Him; so that the contro- is often described as respecting the *Headship rist* or the *Kingdom of Christ*. It is to be in mind, however, that the doctrine of the hip of Christ over his church, as set forth in estminster standards, is fully professed both by stablished Church and by the F. C. of Scotland; nly question between them is, whether or not isting relations of the Established Church of nd to the state are consistent with the due enance and practical exhibition of this doc-

And the question does not directly relate to *terryism* (q. v.). Those who constituted the f S. in 1843, firmly believed that the church be connected with the state, and receive enance and support from it, to the advantage h; whilst they maintained that there must or the sake of any apparent benefits flowing such connection, be any sacrifice of the indence or self-government of the church, as the om of Christ, deriving its existence, organisand laws from Him. Nor has any change nce on this subject been manifested.

Westminster Confession of Faith asserts there is no other head of the church but the Jesus Christ;' and that 'the Lord Jesus, as and Head of his church, hath therein appointed rnment in the hand of church-officers, distinct the civil magistrate;' it ascribes to these officers the right of meeting in 'synods or ils,' which it affirms to be 'an ordinance of and represents the exercise of church-dis- as intrusted to them as well as the ministry word and sacraments. It ascribes to the magistrate much power and many duties conng things spiritual, but no power in or over things themselves. And all this was equally ctrine of the Church of Scotland before the minster Confession was compiled. The supwhich, in many parts of Europe, princes gave to use of the Reformation, and the circumstance ates as well as churches were shaking off the of Rome, led in many cases to a confounding civil and the spiritual. The Church of nd accomplished its emancipation from Rome, ith the co-operation of the civil power, but e of its resistance; and after the Reformation, ottish Reformers and their successors were l'ed to a closer study of their principles, by the ned attempts of the civil rulers to assume ity over all the internal affairs of the church. midst their struggles, the Presbyterians of d so far prevailed as to obtain at different important acts of parliament in recognition of principles, and 'ratification of the liberty of e kirk;' and finally, after the Revolution of 1688, an act ratifying the Westminster Confession of Faith itself, and incorporating with the statute law of the realm all its statements concerning the province of church-judicatories and that of the civil magistrate, and the bounds of their respective powers.

The rights and privileges of the Presbyterian Church of Scotland, guaranteed by the Revolution settlement, were expressly secured by the Treaty of Union, and jealously reserved from the power of the British parliament; yet within five years afterwards, when Jacobite counsels prevailed in the court of Queen Anne, an act was passed for the restoration of patronage in Scotland, with the design of advancing the Jacobite interest by rendering ministers more dependent on the aristocracy, and less strenuous advocates of the most liberal principles then known. This act soon became the cause of strife within the Church of Scotland, and of separation from it; effects which have continually increased to the present day. How the church at first earnestly protested against the act; how this protest gradually became formal, and was at last relinquished; how the church-courts themselves became most active in carrying out the settlement of presentees, notwithstanding all opposition of congregations, are points to which it is enough here to allude. It is important, however, to observe that in all the enforcement of the rights given to patrons by the act of 1712, during the 18th c., and considerable part of the 19th, no direct invasion of the ecclesiastical province took place on the part of civil courts or of the civil power; the presentation by the patron was regarded as conveying a civil right at most to the benefice or emoluments only, whilst the church-courts proceeded without restraint in the induction of ministers; and in a few instances it happened that the benefice and the pastoral office were disconnected by the opposite decisions of the civil and ecclesiastical courts. And even the 'forced settlements,' in which the fullest effect was given by the church-courts to the will of patrons, were accomplished according to the ancient form, upon the *call* of the parishioners, inviting the presentee to be their minister, although the *call* was a mere form in the words of Dr Chalmers, 'the expressed consent of a few, and these often the mere driblet of a parish.'

When the 'Moderate' party, long dominant in the General Assembly of the Church of Scotland, became again the minority in 1834, the accession of the 'Evangelical' party to power was at once signalised by an attempt to restore the *call* to efficacy. This was done by the famous *Veto Law*, by which it was declared 'that it is a fundamental law of this church that no pastor shall be intruded on any congregation contrary to the will of the people,' and enacted, in order to give effect to this principle, that a solemn dissent of a majority of male heads of families, members of the vacant congregation, and in full communion with the church, shall be deemed sufficient ground for the rejection of the presentee. The Veto Law thus determined rather how strong an expression of dissent by the parishioners should be requisite to invalidate a call, than how strong an expression of assent should be requisite to give it validity; a circumstance which was afterwards much turned to account in controversy; as if the *veto* were a new and unconstitutional principle introduced; although it was certainly adopted as the least extreme mode of giving effect to the old principle which the law declared.

The same General Assembly by which the Veto Act was passed, is memorable for the assertion of the constitutional principles and inherent powers of

the church in another important particular, the admission of the ministers of 'chapels of ease' to the same ecclesiastical status with the ministers of endowed parishes, in consequence of which they became members of church-courts, and had districts assigned to them *quoad sacra*, with the full parochial organisation.

The Veto Act was soon the subject of litigation in the Court of Session. A conflict arose which in various forms agitated the whole of Scotland, and which, erelong, related as much to the status of chapel ministers as to the rights of presentees to parishes; and indeed involved the whole question of the relations of civil and ecclesiastical powers, at least as far as the Established Church was concerned. The first case carried into the civil court was that of a presentation to Auchterarder, in which the call to the presentee was signed by only two parishioners, whilst almost all who were entitled to do so according to the Veto Act, came forward to declare their dissent. The decision of the Court of Session, which, upon an appeal, was affirmed by the House of Lords, was to the effect, that the rejection of the presentee on the ground of this dissent was illegal; the opinions of the judges in the Scottish court were indeed divided; but those in accordance with which the judgment was pronounced, asserted the right of the civil courts to review and control all proceedings of church-courts, a power which it was speedily attempted to put forth in other cases, to the extent of requiring presbyteries to proceed to the settlement of qualified presentees without respect to the opposition of congregations; interdicting the admission of ministers to pastoral charges even when no question of emoluments was involved; interdicting the *quoad sacra* division of parishes or any innovation on the existing state of a parish as to pastoral superintendence and the jurisdiction and discipline of the kirk-session; interdicting church-courts from pronouncing ecclesiastical censures, and suspending or revoking them when pronounced; interdicting ministers from preaching the gospel and from administering the sacraments within certain parishes; determining who should and who should not be deemed entitled to sit and vote in General Assemblies and other courts of the church; and other such things, wholly subversive of the independence of the church, and reducing it, if acquiesced in, to the condition of 'a creature of the state.' They were not, however, acquiesced in; and although in one instance, ministers were brought to the bar of the Court of Session, and reproved for disregarding its authority, their protest against its claim to authority was maintained even there; and in the far greater number of instances, its interdicts were broken without any attempt being made to call those who did so to account. It is impossible here to enter into the details of this struggle, which was brought to a final issue by the judgment of the House of Lords in August 1842, affirming a decree of the Court of Session, which required the presbytery of Auchterarder to take the ordinary steps towards the settlement of the presentee to Auchterarder, without regard to the dissent of the parishioners. The law of the land being thus decided by the supreme court to be such as they could not with good conscience comply with, and parliament having rejected an application, in the form of a 'Claim of Right,' for an act such as would have reconciled the duties of their position according to the law of the land, in the church by law established, with what they believed to be their duty towards Christ and according to his law; it now seemed to the greater number of the ministers and elders holding the principle of the independence of the church, that the only course open to them was to retire from their position by the sacrifice of the emoluments and benefits of an establishment. And this they did at the meeting of the General Assembly on 18th May 1843. Headed by Dr Chalmers, Dr Welsh, and others of the most eminent for piety, learning, eloquence, and usefulness in the church, they left the appointed place of meeting of the General Assembly, St Andrew's Church, Edinburgh, and proceeded to another place, previously prepared, Tanfield Hall, Canonmills, where, in the midst of a great concourse of people, the first General Assembly of the F. C. of S. was immediately constituted, and Dr Chalmers was unanimously called to the chair as its moderator. Four hundred and seventy-four ministers renounced their connection with the Establishment, and along with them a great body of its elders and members.

Immediate steps were taken for completing the organisation of the F. C., and extending it as much as possible into every district of Scotland. The forethought of Dr Chalmers had already devised the SUSTENTATION FUND (q.v.). The F. C. undertook from the first the continued support of all the missions previously carried on by the Church of Scotland; and all the missionaries hastened to declare their adherence to the Free Church. An 'education scheme' was soon afterwards undertaken, when it began to be found that parish schoolmasters were ejected from their office for their adherence to the F. C.; and *colleges* for the training of ministers were founded in Edinburgh, Glasgow, and Aberdeen. Considerable opposition was at first experienced on the part of landowners, who refused to grant sites for churches and other buildings; but this gradually gave way, although not until much hardship had in many cases resulted from it. The bitterness of feeling which at first existed between the Established Church of Scotland and the F. C. has passed away to a degree which could scarcely have been expected in so short a time; and there are many who hope to see the questions between them amicably discussed and settled.

In 1862 the number of ministerial charges in the F. C. of S. was 819. There are also numerous 'preaching stations,' in which preaching is regularly maintained, and other ordinances are administered under the care of presbyteries. All of these would be provided with ministers of their own, if the means at the disposal of the church admitted of it; and some of them are continually being added to the list of ministerial charges. The whole sum raised for religious and educational purposes by the F. C. of S. up to March 1861, or in about 18 years, has been about £5,533,856, or rather more than £307,000 a year. In this are included the sums devoted to the erection of churches, manses, school-buildings, colleges, &c. The Sustentation Fund for the year ending 30th March 1861 amounted to £113,462, 17*s.* 7*d.*; the missionary and educational funds to £62,487, 4*s.* 5*d.*

Since 1843, the history of the F. C. has been generally that of peaceful progress. It has been agitated by internal questions respecting the administration of the Sustentation Fund, the propriety of having only one college or more than one, &c., which are of comparatively little interest to those beyond its own pale, but which have produced no permanent divisions, and have either reached or advanced towards a peaceful solution. Latterly, however, it has again been brought into a litigation in the Court of Session, in which, according to the belief of its members its fundamental principles are involved. The minister of the F. C. at Cardross, in Dumbartonshire, having been charged with immorality, and suspended by the General Assembly of 1858, had recourse to the

Court of Session, on the alleged ground of irregularity in the proceedings of the ecclesiastical judicatories, demanding the suspension of the sentence; and being on this account summarily deposed by the General Assembly, he raised an action in the Court of Session, not only claiming damages, but to have the sentence rescinded and found null and void. The case has not yet (May 1862) been brought to a conclusion, and no opinion can therefore be safely expressed as to its probable results or effects.

FREE CITIES, the name given to those German towns, Hamburg, Bremen, Lubec, and Frankfurt-on-the-Maine, which are of themselves sovereign states and members of the German confederation. They are remnants of the once numerous 'Imperial' cities, or cities not subject to any superior lord, but immediately under the empire. They obtained their privileges and distinctions on account of aiding the emperor against his arrogant nobles, lay and clerical, or by purchase.

FREEDOM OF THE PRESS. See PRESS.

FREEHOLD, ESTATE OF (*liberum tenementum*, frank tenement). Real estates in England in the present day are divided into freehold and copyhold. By freehold property is meant all estates which owe no duty or service to any lord but the king. What are now known as estates of freehold were, under the feudal system, denominated frank tenements. They were held by the honourable tenure of Knight's Service (q. v.) and Free Socage (q. v.), and might have been held either of the crown or of a subject. But the statute of *Quia emptores* having abolished subinfeudation, all freehold estates, except those which have been held of subjects since the time of Edward I., are now held of the crown. A freehold estate must be an estate in fee, in tail, or for life; all other estates in land, as estates for years, are called chattel interests. An estate of freehold could in general be created only by livery of sasine of Feoffment (q. v.). By the doctrine of the feudal law, no person who had an estate of less duration than for his own life or for the life of another man, was considered to be a freeholder: and none but a freeholder was considered to have possession of the land. A tenant for years, &c., was regarded as holding possession for the freeholder. The possession of the freeholder might, however, be defeated by the wrongful act of the tenant; for a transfer of possession or livery of sasine by the tenant would divest the freeholder, and leave him to his Right of Entry (q. v.). This effect of a feoffment by wrong was abolished by 8 and 9 Vict. c. 106, s. 4. Before the time of Henry VI., all freeholders were entitled to vote on the election of a knight of the shire, as they still may for the appointment of coroner. But by 8 Hen. VI. c. 7. the famous statute was passed which still in great measure regulates the county elections, and enacts that no freeholder shall vote who cannot spend from his freehold at least 40*s.* a year. By 2 Will. IV. c. 45, s. 18, this qualification is continued as to all freeholds of inheritance, and to freeholders for life in actual occupation, or who have acquired their lands by marriage, marriage settlement, devise, or promotion to any benefice or office.

FREEHOLD LAND SCHEME had for its object to enable mechanics, artisans, and other persons belonging to the lower classes, to purchase a piece of freehold land, of such yearly value as to entitle the owner to the elective franchise. Irrespective of any political object, benefit building societies now exist in most of the greater towns of this country, and are believed to be of great service to the labouring-man. See BENEFIT SOCIETIES.

FREE-LANCES were roving companies of knights and men-at-arms, who, after the Crusades had ceased to give them employment, wandered from state to state, selling their services to any lord who was willing to purchase their aid in the perpetual feuds of the middle ages. They played their most prominent part in Italy, where they were known as Condottieri (q. v.).

FREEMAN AND FREEDMAN. In the most general acceptation of these terms, the first implies one who has inherited the full privileges and immunities of citizenship: the second, one who has been delivered from the restraints of bondage, but who, usually, is not placed in a position of full social or even political equality with him who was born free. Though the words are Teutonic (being composed of *frei*, free; and *mann*, a man or human being), the distinction between them depends on the constitution of Roman society. The equivalent for freeman (*liber homo*), indeed, comprehended all classes of those who were not slaves; but the distinction here pointed out was preserved by the application of the term *ingenuus* to him who was born free (Gaius, i. 11), and of *libertinus* to him who, being born in servitude, was emancipated. For the further development of this subject, as regards the classical nations of antiquity, see SLAVERY, CITIZEN. As the organisation of Roman society survived the convulsions of the middle ages to a far greater extent in the towns (see MUNICIPIUM, MUNICIPAL GOVERNMENT) than in the landward districts, where the institutions of feudality almost entirely superseded it, it is in the borough and other municipal corporations of this country, and of continental Europe, that we still find *freemen*, or persons inheriting or acquiring by adoption, purchase, or apprenticeship, the rights of citizenship. See FREEMAN'S ROLL. But the idea of a freeman was by no means peculiar to the Roman or Romanised population of Europe; on the contrary, it belonged to the constitution of society in all the Indo-Germanic nations. Amongst those branches of them commonly known as Teutonic, it was generally based on the possession of some portion of the soil. In Anglo-Saxon England, the freemen were divided into Ceorls (q. v.) and Eorls (q. v.), or Thanes (q. v.). See CITIZEN.

FREEMAN'S ROLL. By 5 and 6 Will. IV. c. 76, commonly called the Municipal Corporations' Act, which placed the corporate towns, or, as they are denominated, the boroughs enumerated in the schedules A and B—i. e., nearly all the boroughs in England and Wales except London—under one uniform constitution, a distinction is made (s. 2) between the Freeman's Roll and the Burgess Roll. Every person who, if the act had not passed, would, as a burgess or freeman, have enjoyed, or might have acquired, the right of voting in the election of members of parliament, is to be entitled to enjoy or acquire such right as heretofore. And it is further enacted (s. 5), that the town-clerk of each borough shall make out a list, to be called *the Freeman's Roll*, of all persons admitted burgesses or freemen, for the purpose of such reserved rights as aforesaid, as distinguished from the burgesses newly created by the act, and entitled to the rights which it newly confers; these last are to be entered on another roll, to be called the *Burgess Roll*. See BURGESS.

FREEMASON, FREEMASONRY. See MASON; MASONS, FREE.

FREE PORT (Ital. *Porto Franco*), is a harbour where the ships of all nations may enter on paying a moderate toll, and load and unload. Free ports form dépôts where goods are stored at first without paying duty; these goods may then be either

re-shipped for export on paying a mere transit-duty, or they may pay the usual full customs of the country, and be admitted for home consumption. Free ports thus facilitate transit trade, and form, as it were, a foreign district within a state. See WAREHOUSING SYSTEM.

FREE-SPIRIT, BRETHREN OF THE, a fanatical sect of the middle ages, which was very generally (though sometimes secretly) diffused over Italy, France, and Germany, between the 13th and 15th centuries. They took their name from the 'freedom of spirit' which they claimed, in virtue of the words of St Paul (Romans, viii. 2, 14), maintaining that the true sons of God are exempt from subjection to the law. They appeared first in Alsace, in the early part of the 13th c., and attracted notice by their singular attire and their fanatical proceedings, traversing the country in troops, accompanied by women, with whom, under the name of sisters, they lived in the greatest familiarity. Their doctrine was a species of pantheistic mysticism, which they applied with fearless consistency to all the details of the moral obligations. They held, according to Mosheim, who has collected the original authorities, 'that all things emanate from God, and will revert back into Him; that rational souls are part of the Divine Being; that the whole universe is God; that a man, by turning his thoughts inward, is united inexplicably with the First Cause, and becomes one with Him; and that those who are so immersed in the vortex of the Deity attain to perfect freedom, and are divested not only of the lusts, but even of the instincts, of nature.' From these principles, they inferred that the free man, thus absorbed in God, is himself God, and a son of God, in the same sense in which Christ is called the Son of God; and that, as such, he is raised above all laws, human and divine; to such a degree that, according to some of them, 'the godlike man cannot sin, do what he may; either because the soul, being elevated and blended with the divine nature, is no longer affected by the actions of the body, or because the emotions of the soul, after such union, become in reality the acts and operations of God himself, and therefore, though apparently criminal, and contrary to the law, are really good and holy, because God is above all law!' These blasphemous and immoral principles, incredible as they may appear, are extracted by Mosheim, partly from the books of the sect, partly from the decrees of Henry, Archbishop of Cologne, by whom they were condemned. Principles such as these drew down upon the sect the arm of the state, as well as the censures of the church. No sect of the time suffered so much from the inquisition in the 14th century. They were regarded as offenders against public order and morality, as well as against the faith of the church. See INQUISITION. After the first appearance of the sect in Alsace (1212), where its leader was a certain fanatic called Ortlieb (after whom the members are sometimes called Ortliebians), it spread into Thurgau and the Upper and Lower Rhine. During the latter part of that century, one of the leaders, named 'Meister Eckart,' had so large a following at Cologne, that the archbishop made his teachings the subject of a lengthened edict. The sect spread also in Swabia, where its members were confounded with the Beghards. In France, they were popularly known by the name 'Turlupins,' a word of uncertain etymology. We meet them in Bohemia in the beginning of the 15th c., and there is considerable similarity between their principles and those of the Adamites, who figure in Hussite history. From this date they are heard of no more.—See Mosheim, Soames's ed. ii. 582; also Gieseler's *Church History*, iii. 467, iv. 226.

FREE STATE, ORANGE. See ORANGE FREE STATE, or ORANGE SOVEREIGNTY.

FREE'STONE, any rock which admits of being *freely* cut and dressed by the builder. In Scotland, it is synonymous with sandstone. It has also been defined as any rock which works equally freely in every direction, having no tendency to split in one direction more than another. In this sense, limestone and even granite have been called freestones.

FREE-TOWN—a name of the same significance as the *Liberia* of American origin to the south of it—the capital of Sierra Leone, a British settlement on the west coast of Africa. It is situated on the left bank of the Sierra Leone river, about 5 miles from the sea, in lat. 8° 29′ N., and long. 13° 9′ W. Pop. about 16,000. The town is pleasantly situated, and its wide streets are prettily ornamented with rows of orange, lime, banana, or cocoa-nut trees. The temperature, as one may expect from the locality, is tolerably uniform, varying in opposite seasons between the averages of 77°·6 F. and 80°·9. Towards the interior, F. is enclosed by the mountain-chain from which the colony is designated, a position to which the proverbial insalubrity of the climate is partly owing. The population, exclusive of the authorities and the garrison, consists almost exclusively of liberated negroes.

FREE TRADE. This term, when used so late as twenty years ago, expressed a disputed proposition, and was the badge of a political party; it now expresses the most important and fundamental truth in political economy. From its simplicity, it affords, to those who expect to make political economy an exact science, the hope that they have obtained at least one axiom. But it has in reality been established as the result of a double experience—the one being the failure of all deviations from it, the other the practical success of the principle during the short period in which it has been permitted to regulate the commerce of this country.

Trade consists in buying and selling. There is free trade when there is no interference with the natural course of buying and selling, if such interference be intended to improve or otherwise to influence trade. It is necessary to keep this distinction in view, because there are many laws not contrary to the spirit of free trade which interfere with buying and selling; for instance, in this country, it is unlawful to deal in slaves, because we do not acknowledge the right of one human being to be the owner of another; it is unlawful to sell intoxicating spirits without having obtained a licence, because the tax for the licence brings revenue to the Exchequer, and intoxicating liquors are a commodity which it is advisable to tax, in preference to the common necessaries of life, or even harmless luxuries. There are many of these last which cannot be sold into this country without paying customs duty, but this is for the purpose of revenue merely, not as a restraint on trade.

The many attempts made by governments to regulate trade for the purpose of benefiting the communities over which they ruled, may be divided into two great classes: the one prohibited the exportation of commodities, the other encouraged exportation, and prohibited or discouraged importation. The former was the old rule in this and in other countries. It was supposed that the wealth of the country depended on its retaining within itself certain productions of native growth or industry, and their removal out of the country was prohibited or restrained. Until a late period, the exportation of machinery was prohibited; but this was an exceptional remnant of the old principle,

ad yielded to its converse, in which it was
ed that exportation is the source of wealth,
ortation is a wasting of a nation's substance.

:-WILL. The freedom or liberty of the
ne designation of a doctrine maintained in
n to another doctrine, expressed by the
cessity.' The contest between those two
as been maintained in the fields both of
and of metaphysics. The idea of a man
ce' in his actions appears first in the writ-
the ancient Stoics. Afterwards in Philo
an Alexandrian Platonist, who flourished at
nencement of the Christian era, there occurs
y propounded, 'whether it be not the case
upright man is free, and the vicious man a
This language was evidently meant to pay
iment to virtue, and to affix a degrading
n vice, and ought not to have been too
interpreted; for in strictness it might have
ntained, with even greater plausibility, that
ous man, who defies all the restraints of
as the greater liberty of the two. The
of freedom, as applied to the human will,
contended for by Pelagius against Augus-
trines regarding the operation of grace;
later age was the subject of controversy
Arminians and Calvinists, the Calvinists
Jonathan Edwards) having usually been
rians.

Although in this dispute there are certain points of real difference of opinion between the opposing parties, yet the problem has been unnecessarily encumbered with the unsuitable phraseology that has accidentally invested it. The notion of 'free-dom' is intelligible when we speak of a free man as opposed to a Russian serf, or of a free press as opposed to censorship; but with reference to human actions generally, it has no particular relevancy. When a man, urged by hunger, eats the food that is before him, we recognise two separate facts, the one leading to the other: the first is a painful feeling or sensation, the other a series of movements by which food is conveyed to the system; the one fact we call the motive, the other the action, of the will following on the motive; but there is no propriety in describing this sequence as either free or not free. We may inquire into the greater or less certainty of the sequence - namely, whether a hungry man does always, as a matter of course, avail himself of the food presented to him, or whether one may be very hungry with the option of eating, and with no other motive operating to deter from the act, and yet not eat, thus shewing an absence of uniform connection between pain and the movements for alleviating it; this would be a *real* question, and would throw light on the actual constitution of the human will; the question of liberty and necessity does not present us so much with an intelligible question as with an artificial difficulty made by inapplicable phraseology. It would have been much the same to have disputed whether or not the will is rich, or noble, or royal, merely because the virtuous and right-minded man has sometimes been commended by those epithets being applied to him. The word 'necessity,' also, is ill chosen, in consequence of its great ambiguity; being applied sometimes to logical and mathematical implication, as when we say the whole is greater than its part; sometimes to the rigorous uniformity of physical laws, such as gravitation; and at other times to what is merely a high probability, as when we expect that a man of honourable and upright character will speak the truth on some given occasion. See NECESSITY.

If we cast aside these confusing phrases, and inquire what is the real matter of dispute, we shall find that there are intelligible differences of opinion in reference to the sequences of human volition. It may be maintained that our actions have the same uniformity as the successions of the physical world; and this view would be supported by a very wide induction of experience. It will be found that the whole of the complicated operations of society depend upon the certainty that men, in the same circumstances and under the same motives, will act in the same way. We allow for differences of individual character; but when once we have seen what any man is disposed to do in one instance, we take for granted that he will be similarly disposed when the identical circumstances are repeated. The whole of our trading operations are founded on the maxim that human beings prefer a greater to a smaller gain; and it has never been found that any portion of our race has taken a wayward fit, and contradicted itself on this point. We are prepared for exceptions to the rule, when other strong motives are present, but these are merely the intervention of a new force, not the suspension of the law that connects the other motive with its usual consequent. Nor is there anything degrading to human nature in this uniformity; while the opposite state of things would undermine all the securities of human life, and land us in a moral chaos. If human beings, who habitually dread pains and penalties, were suddenly, for no ulterior reason, to court hunger and cold, imprisonment and disgrace, it is obvious that

there would be a speedy termination of man's career on the globe.

Still, the position thus contended for may be, and has been, called in question; or, at least certain exceptions to its universality may be put forward. We are able to comprehend the meaning of this counter-doctrine, even although we may find a difficulty in acceding to it. For example, Socrates drew a distinction between *human* and *divine* knowledge, intending by the one the departments of nature where strict law prevailed, and where by assiduous observation men might attain to certainty; such was the knowledge of the operative respecting his special craft, in which it was absurd to seek for any other source of insight than his own and other men's experience. But this did not include all knowledge. There was a department, the divine, reserved by the gods for their own special administration, and where they did not bind themselves to observe uniformity of dealing. This region included, according to Socrates, such great operations of the physical world, as the motions of the heavenly bodies, the phenomena of weather and season. To be enlightened on these, it was necessary to consult the gods by oracle and sacrifice. Now, applying this view to the case of the human will, it might be maintained that, in the greater number of instances, and in all matters of primary importance, such as self-preservation, the uniformity of human actions must be admitted; but still there may be some deep, subtle, and refined operations, where the same motives sometimes lead one way, sometimes another, the whole situation being in every other respect identical. But it lies with the supporters of this view to substantiate their exceptional cases in the midst of so much evident uniformity. As yet, nothing of the kind has ever been proved, and our only safe ground, philosophically, is what is our safe ground practically – namely, to abide by the doctrine of law in *all* human actions, on which we have not the smallest scruple as respects the preponderating mass of them.

The partisans of liberty, who take up the ground of opposition to uniform law as now expounded, not unfrequently express themselves to the following effect. Granting that the emotions of the mind have a uniform efficacy as motives, and that he that has a musical taste will be found on all occasions acting in conformity with it, still the emotions are not the whole of the mind. We have, in our mental composition, Feelings, and Intelligence, and Activity; but these do not make up our entire being. There is a something that all these inhere in, a substratum or support, which we call our 'self,' the 'ego,' or 'I,' and this abstract self is exempt from the conditions that attach to these attributes of self. This ultimate personality of every human being is free and independent, being exempt from the laws whereby our several feelings operate as motives to our ordinary actions. A self-determining power is supposed to reside here, even if excluded from the other mental adjuncts. It is considered unphilosophical and incorrect to resolve the whole of mind into feelings, actions, and intellect; these are mere attributes of an inexplicable something which each one is conscious of, and recognises as the essence or centre of the mental being, while they are merely properties or attributes. Granting the existence of this inner self, there is said to be sufficient scope for a properly free agency, without going the length of supposing that men are to contradict themselves in the everyday conduct of life.

Such a mode of stating the doctrine of liberty, however, is liable to the charge of logical confusion, not to speak of the difficulty of establishing the existence of the entity in question. If we were to inquire into what constitutes the *essence* of mind, the thing which being present constitutes mind, and whose absence is the negation of mind, we might perhaps not be able to come to a conclusion that all philosophers would acquiesce in. It is always reckoned a very abstract and metaphysical discussion to settle the essence of things; even as regards *matter*, this is not an easy question. But if 'essence' is to mean something, and not absolutely nothing, it must point to some power, property, or quality, capable of being named and signalised. Thus, we might say the essence of material bodies is the quality variously named, as resistance, momentum, inertia; all which imply that one body is at once an obstruction to other moving bodies, and a moving power when once in motion; but if any one insists that this is but one of the attributes of matter, in common with weight, extension, colour, &c., and that there must be something still deeper, in which all the various qualities inhere, we can only answer that we know of no such essence or substratum, and are incapable of conceiving any such. We may fix upon the most fundamental, the most universal, and inerasable quality of a thing, such as this property of resistance as regards material bodies, and term that the essence; while any other attempt at discovering an essence would only end in setting up fictions. So in the case of mind. If we are called on to specify any one aspect of our mental constitution more universal and fundamental than the rest, with a view to setting forth the essence of mind, we should be obliged to select VOLITION, or action governed by feeling, as the main or central fact. Wherever we can prove the existence of feeling, and of an activity controlled by that—as when an animal uses its organs to preserve its own life, to cater for pleasures, and ward off pains—we should have to admit the reality of mind, although, perhaps, the intelligence were of the lowest kind. Any being not possessing both sensibility and the power of acting in accordance with it, could not be said to possess a true mental nature. We should not trouble ourselves with considering the possible existence of a mystical 'ego,' but should at once declare that such a being did not come up to the standard or definition of mind. Will or volition, as thus explained—namely, the direction of the active organs of a living creature to chime in with its various feelings – is itself the essence or substratum of mind, as resistance is the essence of matter. Wherefore, to speak of feelings and actions as something apart from the 'ego,' but inhering in it, is merely to count the same fact twice over, or to call a thing the attribute of itself. Volition *is* mind, and not an attribute of mind; and when we have specified the power of voluntary, or feeling-guided action, and a certain amount of intelligence, varying greatly in individuals, we have specified everything that can belong to any individual man or animal; an 'ego' beyond this is something inexplicable and fictitious. It cannot, therefore, be admitted that any foundation is given to a supposed 'free agency,' by referring to this occult and imaginary essence, any more than it would be competent to claim exceptions to the great physical laws that govern material bodies, by assuming an occult essence of matter with powers and properties at variance with its inertia, weight, extension, and other known qualities.

In one respect, the mind is differently situated from the material world in all that regards the power of tracing strict uniformity, and predicting the future from the past. Each one of us has direct access to our own feelings, but only an indirect and imperfect access to the feelings of another person. Excepting self, we can never know the whole of what any one

ur best observations and reasonings are but mations to the truth, and predictions founded a are liable to be falsified through unseen a the arcana of another man's individuality. ng the uniformity of sequence of motive and are never able to exhaust the motives of any ind, beyond our own; and thus each one said to move in a certain inner circle of the rable and unpredictable, while the large the everyday actions of all human beings an almost undeviating regularity. This is important distinction between mind and although not invalidating the great general niform law, as attaching to the one no less the other. For a sketch of the history of at controversy, see Dugald Stewart's *Active*

matter passes from the liquid to the aëriform eat also disappears, and the knowledge of : has been applied to the cooling of liquids, the actual production of ice. If a glass ontaining water be covered with a cloth, s kept constantly wet by the application of he evaporation from the wet cloth will soon the temperature of the contents of the nd if the cloth were moistened with alcohol ether, the cold would be proportionally the degree of cold varying with the rapidity ent of the evaporation. Wine-coolers, or water-coolers, made of porous earthenware, act in the same manner as the cloth. They are soaked in, and saturated by water, which by its evaporation occasions cold. Coolers of this kind are common in most hot countries. On the ancient monuments of Egypt, a man is sometimes represented as fanning these earthen vessels with a palm-leaf, in order to promote evaporation, and the Arabs in that country still practise this custom.

In some parts of India, where the dryness of the air allows a considerable evaporation to take place, ice is obtained in the following manner: 'Flat, shallow excavations, from one to two feet deep, are loosely lined with rice-straw, or some similar bad conductor of heat, and upon the surface of this layer are placed shallow pans of porous earthenware, filled with water to the depth of one or two inches. Radiation (see HEAT) rapidly reduces the temperature below the freezing-point, and ice is formed in thin crusts, which are removed as fast as they are produced, and stowed away in suitable ice-houses.'—Miller's *Elements of Chemistry*, 2d ed., vol. i. p. 220.

FREEZING-POINT. See THERMOMETER.

FREI'BERG, an ancient city of Germany, the centre of administration for the Saxon mines, is situated on the northern slope of the Erzgebirge mountains, on the left bank of the Münzbach, not far from its confluence with the Mulde, 20 miles south-west of Dresden. It owes its origin to its silver-mines, discovered about the year 1190. It is still surrounded by old walls and towers, and contains many interesting buildings and institutions, of which the principal are the town-house, dating from 1410, and the cathedral (1484—1512), two stately Gothic edifices, and the Berg-Académie, or School of Mines, founded in 1765, the most famous institution of the kind in Europe. At the Berg-Académie, instruction is given by professors in surveying, mining, the preparation of ores, geology, mineralogy, &c. It possesses lecture-rooms, a library, and mineralogical and geological collections; and has attached to it three separate laboratories, and an office for the sale of minerals. Humboldt, Werner, Jameson of Edinburgh, and many other eminent geologists and mineralogists, studied at this institution. There are, it is said, about 150 mines of silver, copper, lead, and cobalt around Freiberg. The manufactures consist principally of articles in imitation of gold and silver ware, of white-lead, gunpowder, iron and copper wares, &c. In the 17th c., it was a place of great wealth, and had a pop. of 40,000. The mines, however, have of late greatly fallen off, owing either to the richest veins being exhausted, or to the shafts being driven so deep that the water cannot be drained off from them. Pop. 15,776.

FREIBURG, or FRIBOURG, a canton of Switzerland, bounded on the N. and E. by Bern, and on the S. and W. by Vaud and the Lake of Neuchâtel. It has a superficies of 623 square miles, and, according to the census of 1860, a population amounting to 105,970 souls, of whom 90,362 were Catholics. More than two-thirds of the inhabitants are French; the remainder are Germans. The official language is French, but all the laws and decrees binding on the whole canton are published both in French and German. The surface of the country is hilly, the mountains in the south of the canton forming a continuation of the Bernese Alps, and rising in the highest points upwards of 7000 feet high. The principal rivers are the Saane or Sarine—which traverses almost the whole extent of the canton from its southern to its northern extremity—and the Broye. The country abounds in excellent meadows and rich pastures, upon which are reared the strongest horses and the best breed

of cattle in the whole of Switzerland; indeed, the great part of the wealth of the canton consists in cows, sheep, goats, and horses, of which in proportion to its area there are great numbers. Dairy husbandry, and especially cheese-making, is pursued with great success; 40,000 cwt. of cheese are said to be made yearly. There are considerable manufactures of straw-plat, leather, cherry brandy, and tobacco. F. was received as a member of the Swiss confederation in 1481, and in 1848 a liberal constitution was established. Five members are sent from this canton to the national council.

FREIBURG, or FRIBOURG, a town of Switzerland, capital of the canton of the same name, is situated on both banks of the Sarine, but chiefly on a hilly promontory formed by one of its windings, about 18 miles south-west of Bern. Seen from some distance, the town has a highly imposing and picturesque appearance. Houses climb to the top, and extend to the very edge of the precipice that overhangs the river, and in another portion of the town they form terraces, the roofs of one tier being on a level with the pavement of another; while the whole is surrounded by a long rising and falling line of embattled walls, with watch-towers and gateways of ancient fortifications which still exist in a perfect state. The banks of the Sarine are united by four bridges, one of them a suspension-bridge, 906 feet long, 28 feet wide, and 175 feet above the stream, the longest bridge of a single span in the world—about 300 feet longer than the Menai Bridge. Another suspension-bridge spans the gorge of Gotteron, and is about 700 feet long, and 284 feet above the valley beneath. The church of St Nicholas, a fine Gothic structure, has an organ built by a native of F., which has 7800 pipes, one of them 32 feet long, and is considered the finest toned instrument in Europe. This church has also the highest spire and finest set of bells in Switzerland. The other principal buildings are the Cantonal School (previous to 1848 the Jesuits' College), the most conspicuous building of the town; and the Lyceum. The inhabitants of the upper portion of the town speak French; in the lower portion, German is spoken. F. has few manufactures; the chief are woollens, hardware, leather, pottery, and tobacco. Pop. 9000, of which only 500 are Protestants.

FREIBURG, a town of Germany, in the grand duchy of Baden, capital of the circle of the Upper Rhine, is the seat of an archbishop, and is situated on the Dreisam, on the western border of the Black Forest, 42 miles south-south-east from Strasburg. It is an open, well-built town; the walls and ditches with which it was formerly surrounded, have been converted into promenades and vineyards. The Minster or Cathedral of F. is one of the most beautiful and perfect specimens of Gothic architecture in Germany. It is cruciform, and built of red sandstone, was begun in 1122, and not thoroughly completed till 1513. It has a tower 367 feet high, remarkable for its elegance and lightness. In one of its chapels, the University Chapel, there are, among other pictures, a Nativity and an Adoration by Holbein, the latter considered one of his most successful pictures. The university of F. was founded in 1456; it is the Roman Catholic seminary of the duchy of Baden. The Exchange (*Kaufhaus*) is a quaint Gothic structure of the 16th century. The chief manufactures are chicory, tobacco, paper, potash, &c. Pop. 16,730, one-eighth of whom are Protestants.

FREIGHT (a word having the same origin as 'fare'), the hire of a ship, or part of a ship, for the transport of merchandise; also the merchandise so transported. The agreement for the service is termed a Charter-party (q. v.).

If a merchant freight a whole ship, but neglect to fill it, the captain is not at liberty to complete the cargo from other sources, without accounting to the merchant for any moneys received for such additional load. On the other hand, if the merchant covenant to freight a certain portion of a ship, he is bound to pay the sum agreed on for that portion, notwithstanding that his goods may fail to occupy so much space. If, in the charter-party, a day be appointed for sailing, and either the merchant fail to have his goods ready for embarkation by the time fixed, or the vessel be unprepared to start—wind and weather permitting—the agreement may be declared void by the aggrieved party, who can also recover at law for any detriment caused to his property in consequence of the delay. The use of charter-parties has been traced back as far as the reign of Henry III.

This contract, which in England, and generally in the commercial language of this country, is called freight, is more commonly spoken of by the legal writers of Scotland as Affrightment, from the French *affrètement* (Bell's *Com.* i. p. 414), but there is no essential difference in the laws of the two countries with regard to it. Throughout the whole commercial world, indeed, in so far as its provisions are not made the subjects of positive stipulation either by Charter-party or Bill of Lading (q. v.), they will be held to be in accordance with the usage of trade, and of that particular branch of trade to which the hiring has reference.

It was formerly held that the payment of the wages of the crew was contingent on the earning of freight by the ship, in accordance with the maxim of Lord Stowell, that 'freight is the mother of wages.' But this rule, which was already subject to many exceptions, has been abrogated by the Merchant Shipping Act (17 and 18 Vict. c. 104), and wages may now be recovered either by seamen or apprentices, even though no freight has been earned by the vessel. The seaman has a right to cling to the last plank in satisfaction of his wages; but in cases of shipwreck, his claim for wages will be barred if it be proved that he did not exert himself to the utmost to save the ship, cargo, and stores. This provision was first introduced by 7 and 8 Vict. c. 112, s. 17, which enacted that, in order to enable him to recover his wages, the seaman should be bound to produce a certificate from the master, or chief surviving officer of the ship, to the effect that he had so exerted himself. By s. 183 of 17 and 18 Vict. c. 104, the onus of proof is very properly laid on those who impugn the conduct of the seaman. The old rule is still adhered to in America, but it is not applied to the master, and it does not hold with reference to seamen, if the freight has been lost by the fault either of the master or owner; e. g., if the ship has been seized for debt, or for having contraband goods on board. See Kent's *Com.* iii. pp. 266, 267

FREILIGRATH, FERDINAND, a brilliant lyric poet of Germany, was born at Detmold, in the principality of Lippe, 17th June 1810. He attended the high school in his native town till the year 1825, when he entered a merchant's office, first at Soest, and afterwards at Amsterdam. Encouraged by the favourable reception of his poems, he abandoned mercantile pursuits, married, and removed to Darmstadt. In 1842, a pension was bestowed upon him by the king of Prussia, whereupon he removed to St Goar, on the Rhine. This circumstance, and his poem *Aus Spanien*, deprived him of the sympathy of the liberal party, which, however, was restored to him twofold when, in 1844, he gave up his pension, and in his political poems attached himself to the

atic party. The publication of his *Glaubensbekenntniss* (Confession of Faith), in the same year, ed him to take refuge abroad. He went to a, Switzerland, and in 1846, to London, where med his mercantile pursuits, and became ndent for the banking-house of Huth & Co. s about to accept an invitation to America, m by Longfellow, when the events of 1848 him to his native country. F. settled in lorf, where he became the most important of the democratic party, and sang the of democratic socialism. He was impeached unt of his poem *Die Todten an die Lebenden* ead to the Living). The interest felt in this as extraordinary. F. was defended by celeadvocates, who did not fail to ridicule the ewn in prosecuting a man for writing poetry, trine that the poet is a 'chartered libertine' xpression of his sentiments, carried the day, was acquitted, 3d October 1848. The conse was inevitable. His poem immediately the rage; the first edition was sold off in ort within a few hours, and thousands of and incorrect impressions were circulated Germany. A second prosecution induced to withdraw from his native country, and 849 he has resided in London. F.'s principal ions are his *Gedichte* (Stüttg. 1838; 18th 857); *Ca Ira* (Herisau, 1846); *Die Revolution* (ib. 1848); and *Neuere politische und sociale* (Col. 1849). A complete edition of his appeared at New York (*Sämmtliche Werke*, 1858–1859). F.'s poems display lively ation, fire and melody of rhythm, a richness ution, and a picturesque originality of style, not seldom, however, passes into eccend merely 'spasmodic' force of expression. nslations, it should also be observed, are le, especially of the poems of Victor Hugo, Burns, and Longfellow's *Hiawatha*.

FSCHÜTZ, the free-shooter, is the name the legend to a hunter or marksman who, ring into a compact with the devil, procures x of which infallibly hit, however great the , while the seventh, or, according to some , one of the seven, belongs to the devil, who it at his pleasure. Legends of this nature e among the troopers of Germany of the d 15th centuries, and during the Thirty War. The story first appeared in a poetic 1810 in Apel's *Gespensterbuch* (Ghost-book, 810–1815), and F. Kind adapted the story 843) to the opera composed by Weber in hich has made it known in all civilised s.

ISING, a town of Bavaria, is situated in a agreeable district on the left bank of the miles north-east of Munich. The town seat of an episcopal prince till 1802, when was secularised. The bishopric of F. dated ck as 724 A.D., but its bishops were first nces by the Emperor Ferdinand I (1619 – The chief buildings are the palace formerly ishop, and a beautiful cathedral, dating from e., having three naves, two towers, and a crypt, the pillars of which have monsters g up their shafts. Pop. 6000, who carry on and distilling, and manufacture vinegar, saltpetre, &c.

JUS (anc. *Forum Julii*), a small town of in the department of Var, is situated a mile from the embouchure of the Argens (anc. *us*) into the Mediterranean Sea, and 15 uth-east of Draguignan. It was originally a rom Marseille, and was afterwards colonised anew by Julius Cæsar, and called Forum Julii. It has remains of ancient Roman walls, and of a Roman circus and viaduct. The ancient harbour, at one time the most important Gallic port, and in which Augustus posted the fleet of 300 galleys which had been captured from Antony at Actium, has become silted up. Here, or rather at the new harbour of St Raphael, 1¼ miles off, Napoleon landed on his return from Egypt in 1799, and embarked for Elba in 1814. Pop. 2665.

FREMONT, JOHN CHARLES, a distinguished explorer, born at Savannah, in Georgia, January 21, 1813. His father was a Frenchman, his mother a native of Virginia. At the age of 15, he entered the junior class of Charleston College, South Carolina; but he left that institution without taking a degree. From 1830 to 1833, his time was chiefly employed in teaching in Charleston. In 1833, he was appointed teacher of mathematics on board of the United States sloop-of-war *Natchez*, in which he made a cruise of more than two years. After his return, he became assistant-engineer under Captain Williams, then engaged in a preliminary survey for a railway between Charleston and Cincinnati. In the spring of 1838, he accompanied M. Nicollet, as his principal assistant, in the exploration of the region north of the Missouri river. While occupied with these important labours, he was appointed by President Van Buren second-lieutenant in the corps of Topographical Engineers.

In the early part of 1842, F. was appointed to the command of an expedition sent out to explore the country between the Missouri river and the Rocky Mountains. He set out from St Louis near the end of May, and reached the South Pass (about 42° 30′ N. lat., and 109 30 W. long.) in the Rocky Mountains, in August. In the vicinity of the pass, he ascended a lofty peak (since known as Fremont's Peak), which he found to be 13,570 feet above the level of the sea; this is the highest summit of the Rocky Mountains yet measured within the limits of the United States. He returned to St Louis about the middle of October. Throughout the entire route of the exploration, F. had made careful barometrical and astronomical observations, for the purpose of ascertaining the elevation and position of the different points, besides noting the character of the soil, and adding largely to the sciences of geology and botany.

In 1843, he set out on another expedition, planned on a more extensive scale. Passing beyond the Rocky Mountains, he partially explored a remarkable tract of country, to which he gave the name of the Great Basin (q.v.). Having advanced as far as Fort Vancouver, about 90 miles from the mouth of the Columbia River, on the 10th of November the party commenced their homeward journey. They soon found themselves traversing, in the depth of winter, a wild and desert region, in many parts of which it was impossible to obtain any pasture for their horses and mules, while, in the most favoured portions of their route, grass was to be found only in a few sheltered spots. At length, after incredible hardships and sufferings, finding that it was in vain to attempt to reach the United States at that season, F. resolved to strike directly across the Sierra Nevada, towards the vales of California. Although assured by his Indian guides that it was quite impossible for any man to cross those mountains, he boldly undertook the desperate enterprise, and on the 6th of March succeeded in reaching Sutter's Fort, an American settlement in California, near the river Sacramento. More than half of his animals had perished on the way, and those that remained, though bearing no burden, had scarcely strength to drag themselves

along. The expedition returned to the United States in the summer of 1844. In acknowledgment of his important services, F. was raised, January 1845, to the rank of brevet-captain. The fame of his discoveries, joined to the heroic daring and fortitude which he had exhibited in his last expedition, not only made him the theme of enthusiastic admiration in the United States, but soon spread his name to the remotest parts of the civilised world. In 1846, F. having again led a company of explorers into California, took an active part in the war against Mexico. Becoming involved in a dispute between two of his superior officers as to the right of command in California, F., on his return to Washington, was censured for disobedience; and as he could not admit the justice of the decision against him, he resigned his position in the army.

In 1848, F. set out on a fourth expedition to California at his own expense. Attempting to cross the mountains between the Rio Grande and the Colorado in mid-winter, the guide mistook the way, and F. lost all his animals and one-third of his men. In 1849, he settled in California, and in December of that year was chosen senator to represent the new state in the national congress. In 1850, he received from the king of Prussia, through Baron Humboldt, 'the great golden medal for progress in the sciences;' and about the same time the Royal Geographical Society of London awarded him the 'founder's medal for pre-eminent services in promoting the cause of geographical science.' In 1856, he was nominated by the republican party as their candidate for the presidency. In the contest that followed, James Buchanan was elected president; but F. received the votes of eleven of the northern states.

Early in the history of the civil war in the United States, F. was appointed major-general in the Federal army.

FRENCH BEANS. See KIDNEY BEANS.

FRENCH BERRIES, Avignon Berries, Persian Berries, or Yellow Berries (Fr. *Graines d'Avignon*), small berries, the fruit of certain species of Buckthorn (q. v.), but principally of the Yellow-berried Buckthorn (*Rhamnus infectorius*), used by dyers in dyeing yellow. For this purpose, they are gathered unripe, and dried; they yield a rich yellow colour, but it is fugitive, and on this account the use of this dye-stuff has very much given place to that of mineral dyes. It is, however, still imported into Britain from the Levant and from the south of France. That from the Levant is the best. The yellow-berried buckthorn is a very spreading procumbent shrub, with ovato-lanceolate smooth leaves, growing naturally in rough rocky places in the countries near the Mediterranean. It is cultivated to some extent in the south of France.

FRENCH HONEYSUCKLE (*Hedysarum coronarium*), a beautiful biennial plant of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, with branching and spreading stems, pinnate leaves, scarlet or sometimes white flowers, and jointed pods, which have one seed in each articulation. It has fine foliage, and a very elegant appearance, and is often to be seen in flower-gardens. It is a native of the south of Europe, and is there pretty extensively cultivated as food for cattle. It grows to a height of four or five feet, yields a large crop, and is very nutritious. It is used either in a green state, or dried as hay. It requires a rather warmer climate than that of England for its profitable cultivation. The genus *Hedysarum* contains many species, extensively diffused over the warmer parts of the world. A few are found in cold regions, as *H. fruticosum* in Siberia, growing in sandy soils, very useful in fixing them by its roots, and valuable as affording food for horses.

FRENCH LANGUAGE AND LITERATURE. The *French language* has been developed under the combined influence of numerous forms of speech, among which Latin, as in every other tongue of Western Europe, takes a principal part. It would appear that in the 4th and 5th centuries of our era, the whole of Gallia, from the Rhine to the Pyrenees, had adopted the language of the Roman conquerors, not the polished speech of the classic writers—the *sermo urbanus*—but the form of Latin that had become common to all the subjugated provinces of Central Europe—*lingua Romana rustica*. Suetonius, Pliny, Juvenal, and Martial make frequent reference to the Latin in use in Southern Gaul and Spain; and in the 4th c. we find that, under the Emperor Theodosius, the Roman senate was addressed by an orator of Gaul in rude and uncultured transalpine Latin. At this period, and much later, Latin was employed in the provincial assemblies of Gaul; but in the 7th c., two other forms of speech had come into general use—a provincial dialect of the *lingua Romana*, and a form of German known as the *lingua Theotisca*. The latter which was probably a mingled jargon, used in common by the Frankish and Teutonic tribes, and consequently in vogue in the north and east, received a more definite development under Charlemagne, who caused a grammar of it to be prepared for the use of the schools which he had established, and in which it was taught conjointly with Latin. The council of Tours (813) recommended the use both of the rustic Latin and the Teutonic dialect; and in 842, in the compact made between the two brothers, Charles the Bald and Louis the German, the former swore in the *Romana rustica*, and the latter in the *Teutsche* language, which, although it had been generally spoken at the court of Charlemagne, had already given place in France to the Frankish form of Latin. This Gallo-Romanic idiom early branched off into the two characteristically different forms of the *Provençal* or *Langue d'oc* of the south, and the *Roman Wallon*, or *Langue d'oil* of the north. The comparative prosperity which the south of France enjoyed, first under the kings of Arles, and subsequently under the counts of Provence, its freedom from foreign aggression for several centuries, the beauty of the climate, and the more thoroughly Romanised character of the people, led to the early development of the Provençal, and, by the lips of the troubadours, breathed forth a rich melody of song, which, after a time, was re-echoed in less harmonious tones by the *trouvères* of the north in their ruder tongue. The earlier productions of these two schools exhibit striking differences in diction, inflection, and construction; and while the troubadour sang of love, and dwelt on the beauties which a southern climate and a fruitful soil scattered broadcast over the face of nature around him, the northern *trouvère* invented a chivalrous mythology of his own, and ascribed to the heroes of Greece and Rome, and the brethren in arms of King Arthur and Charlemagne, the sentiments of his own times. The use of the northern or Walloon French was very considerably extended through its adoption by the Normans, who in time carried it under William the Conqueror to England, and, under the northern leaders of the Crusades, to the south and east. In the south, on the contrary, the cruel persecutions of the Albigenses, against which the troubadours inveighed aloud, checked the development of the Provençal language; for the songs of the troubadours were proscribed, and thus the use of the *langue d'oil* soon extended with the spread of northern power into the provinces of Provence and Languedoc.

the earliest monuments of the French- in the form in which it shews evidence of al development into modern French, is the 'e *Rou*, a versified chronicle of the exploits and his successors, composed by Robert In this composition, the language is no ie sonorous, many-vowelled Provençal, or grel Latin of the *lingua rustica*, but a orm of speech. The language thus formed ngrafting of Norman, Frankish, and Teu- ms on the degenerate Latin of the Gallic , was rapidly developed under the foster- ence of the university of Paris and the , which already, in the 13th c., attracted ed men of all nations to their schools. The 'e la Rose, begun in the 13th c. by Jean de nd completed in the 14th c. by G. de Lorris, t's *Bible*, belonging to the same period, are f the literature of France in the middle ich consisted chiefly of tales of chivalry se sallies against the clergy. Froissart's s of the 14th c., which afford a vivid picture rs of the English and French, in which he ook an active share, are written in a dialect ite comprehensible to the modern student. who wrote in the 15th c., is a less pictur- rrator; but he may be classed among the rue historians of his country, for he was one st who observed public events with judg- d recorded what he had seen in a straight- truthful manner. Francis I., by his love song, and dramatic representations, gave encouragement to literature; while the language acquired force and terseness the writings of Rabelais, Ronsard, Amyot, taigne; and although, under the regencies rine and Marie de' Medici, Italian writers e patronised at court than native authors, iage and the literary talent of the nation lergoing a process of gradual development, as completed by the establishment, under ces of Richelieu, of the *Académie Française*

At this period, Corneille brought French to its highest point of grandeur in the yle of the drama, which he had adopted. pieces are *Le Cid*, *Les Horaces*, *Cinna*, cal, in his *Lettres Provinciales*, established d of French prose; while Descartes, in his *sur la Méthode*, shewed the adaptability anguage to subjects requiring conciseness ision. A long galaxy of great names gave to the reign of Louis XIV. in every literature. Notwithstanding the frivolity bits of the higher classes in France during d, no age produced more vigorous writers al thinkers. Bossuet and Flechier won y their noble funeral orations; Bourdaloue illon, by their eloquent preaching; Fénélis learning and earnest exhortations; and y his Christian view of the great questions n experiences. In dramatic literature, d Molière stand forth conspicuous among f lesser writers, the former pre-eminent y, as his *Andromaque*, *Iphigénie*, *Phèdre*, he latter inimitable in comedy, and exhibit- erful powers of delineating human character umorous point of view, that have never passed. Among his best pieces we may *Tartufe*, *Le Misanthrope*, and *Les Femmes*

La Fontaine is alike well known among rymen for his moral Fables and his licen- les. La Rochefoucauld and La Bruyère, *Sentences* and *Caractères*, depicted human , with its peculiarities, inclinations, and strong, humorous, and vivid touches. This ge of Memoirs and Letters: in the former branch of contemporary history, Cardinal Rets was perhaps the most successful of the host of writers who gained a reputation in this special department of literature; while Madame de Sévigné's letters are models of easy epistolary style, and afford a lively picture of the times. This age, in which, at anyrate, the *semblance* of religion had been respected, was followed by one of scepticism, infidelity, and philosophical speculations of the wildest kind. Four men of genius, Montesquieu, Voltaire, Rousseau, and Buffon, contributed, to a very great extent, by their writings, and the influence which they exerted on the minds of their contemporaries, in bringing about the Revolution. Montesquieu, by his philosophical dissertations on the laws and government of his country, taught the French to take more enlightened views of the rights and duties of different classes of society, and thus naturally roused the angry passions of the oppressed lower orders; while the passionate eloquence of Rousseau won a hearing for doctrines which were entirely subversive of moral obligations, and recognised no higher standard than human inclinations. Voltaire's versatility of powers, which were exercised with equal ease, and nearly equal success, on tragedy, satire, romance, poetry, history, and philosophy, enabled him, to the end of his long life, to maintain the supremacy over public opinion, which he had won in his youth. Buffon devoted himself to the study and description of nature, and his *Histoire Naturelle*, which inaugurated a new era in the literature of natural history, is a remarkable monument of the science and learning of that period. Diderot, and D'Alembert the geometer, founded the *Encyclopédie*, which, while it gave a lucid summary of numerous branches of human knowledge, was always hostile to religion. The Revolution, which had been materially accelerated, if not produced, by the inspirations of men of consummate intellect, was not favourable to literature. A period of almost complete intellectual torpor succeeded the active mental development that had characterised the preceding classic and philosophic periods. The Empire was scarcely more propitious to learning; but with the *Corinne* and *L'Allemagne* of Madame de Staël, and *Les Martyrs* of Chateaubriand, a reaction took place; and these productions of the new romantic school were soon followed by numerous others, either belonging to the same, or to the rival classical school. Among the host of young and original writers who now acquired reputation, we may instance, in dramatic art, poetry, and fiction, Alexandre Dumas, Victor Hugo, Alfred de Vigny, and Fréderic Soulie. The first of these has been one of the most prolific of novel-writers; among his most popular works are –*Les Trois Mousquetaires*, *Le Comte de Monte Christo*, *Le Collier de la Reine*, &c. Casimir Delavigne has attempted to combine the romantic and classical schools in his *Louis XI.*, *Les Enfants d'Edouard*, &c. George Sand (Madame Dudevant) is one of the most elegant writers of her country, and her works are models of style. Her *Indiana*, which appeared in 1832, inaugurated a new era of emotional novel-writing, and has had numerous imitators. Among her numerous works, the most popular are *Jacques*, *Lélia*, *Mauprat*, *André*. Of late years, she has written almost exclusively for the stage. *Les Mystères de Paris*, and *Le Juif Errant*, which depict the concealed miseries and depravities of social life, quickly brought their author, Eugène Sue, into notice. The tendency to materialism and sensualism, which characterises the works of the two last-named writers, is more or less perceptible in all belonging to their age in France. The few artistic and good historical novels that have appeared have met with

little success among the general public. Among original and finished writers of tales, A. de Musset ranks foremost, while Mérimée the historian, who has written several novels of very great merit, has not always met with the success which he deserved. Of late years, a host of young writers have appeared, some of whom belong to what they themselves term the realistic school. A. Dumas the Younger, who is following in the steps of his father, E. Feydau, O. Feuillet, and E. About, all deserve notice. Poetry has not been followed with any marked success in France during the present century; and beyond the great names of Béranger—whose songs are unsurpassed in any other tongue—Victor Hugo, Lamartine, and Musset, there are few French poets of the present day known beyond the limits of France. The theatre absorbs much of the talent of Young France; but here light pieces, vaudevilles and farces, are the most successful, as is testified by the host of comedies and operatic scores for which Eugène Scribe has obtained a favourable reception. History is undoubtedly the most successful branch of modern French literature. Among those who have gained for themselves a world-wide reputation in this department of research, we would instance Barante, whose early work, *L'Histoire des Ducs de Bourgogne*, has been followed by the recent publication of histories of the *Convention* and *Directory*. Guizot, another writer holding monarchical views, has shewn indefatigable powers of research and a philosophic power of generalisation in a great number of works, among which the first rank may be awarded to his *Essais sur l'Histoire de France*, and *L'Histoire de la Civilisation en Europe*. Thierry, in his *Lettres sur l'Histoire de France*, and *L'Histoire de la Conquête de l'Angleterre par les Normans*, displays great powers of narration and aptitude for theoretic criticism, perhaps more imaginative than sagacious. Sismondi has shewn great research and profound knowledge in his somewhat diffuse History. Thiers has devoted his learning, industry, and powers of delineation to the exposition of the revolutionary and imperial phases of French government. Michelet and Louis Blanc are both known for their democratic principles; the latter, in his *Histoire de Dix Ans*, gives one of the most vivid pictures of contemporary history that we possess. Lamartine, who carries his poetic inspirations and enthusiastic temperament with him into his historical researches, presents magnificent but not perfectly trustworthy pictures of history in his *Histoire des Girondins*, *Histoire des Constituents*, and *Histoire de la Restauration*. Villemain, although better known for his history of literature in the middle ages and in the 18th c., is yet to be classed among historians as the author of *Histoire de Cromwell*, and his *Souvenirs Contemporains*, &c.

There is no department of the moral and physical sciences that has not been enriched and elucidated by the labours of French savans. Among the great scientific writers of modern France, we may instance in metaphysics and political economy, Victor Cousin, Jouffroy, Simon, and Lamennais, whose eloquent defence of spiritualistic and religious principles reacted strongly against the materialism to which French philosophy had long been addicted; while socialism has found powerful advocates in Comte, St Simon, Fourrier, and Leroux. Chevalier, De Tocqueville, Bonald, and Laferrière, are known for their able and philosophic exposition of the jurisprudence of nations, and the social and political condition of democracy in the new and old world. In philology and ancient history, Champollion, Sylvestre de Sacy, Renau, Remusat, and Stanislas Julien, by their profound researches into Egyptian hieroglyphics and Semitic literature, have thrown new light on the origin of races and languages. In mathematics D'Alembert, Laplace, Lagrange, Biot, Ampère, and Arago stand unrivalled. In natural history, and its kindred sciences, among a host of great French discoverers, we can only instance a few of the more distinguished, as Cuvier, Geoffroy and Isidore St Hilaire, Blainville, Jussieu, D'Orbigny, Haüy, Gay-Lussac, Elie de Beaumont, Milne-Edwards, Brongniart, whose services in the cause of science have identified their names with the triumphs of physical research.

No country has ever produced a greater number of elegant essayists and literary critics than France, and no language seems to lend itself more readily than French to a concise and graceful, yet forcible style of epigrammatic writing, and few admit of more idiomatic terseness, or a more polished play of words. French literature has of late years been suffering from the state of torpidity which seems in France to be the natural secondary effect of any great political movement, and hitherto the imperial rule has not been propitious to the development of original literary talent.

For authorities on French literature, see Nisard, *Hist. de la Littér. Française* (1846); Baron, *Hist. Abrégée de la Littér. Franç. jusqu'au 17me Siècle* (1841); *Hist. Littér. de la France*, by Dom. Rivet, and other Benedictine monks, continued by members of the Institute (22 vols. 1733—1858); Villemain, *Tableau de la Littér. au Moyen Age* (1857); Demogeot, *Hist. de la Littér. Franç.* (1857).

FRENCH POLISHING, the name given to the now common method of coating wood with a fine smooth surface or varnish of gum-lac. Gum-lac is easily soluble in spirits of wine, methylated spirits, or wood-naphtha, and a varnish is thus produced; but if it be applied simply with a brush, as copal, mastic, and most other varnishes are applied, the result is a very rough and broken surface, instead of a smooth continuous polish. To obtain this with a lac-varnish on wood, it is necessary to apply a very small quantity at once, and to rub it continuously until it dries. If a dry rubber be used, the lac sticks to it, and it is dragged from the wood. An oiled rubber is therefore used, and the oil should be a drying oil, such as linseed. Various kinds of rubbers are used; such as a ball of wool covered with rag, a small roll of cloth with the edges downwards, and likewise covered with rag. The varnish and oil may be mixed together in a bottle, shaken up when used, and a little poured upon the rubber; or a simple solution of shell-lac may be used, and some of this laid upon an oiled rubber. Several successive coats and rubbings are required, and some skill is necessary, in order to produce a good surface.

The following are some receipts for French polish for mahogany; they might be multiplied to a great extent, for they should be modified according to the kind of wood to which they are applied, and the mode of applying them: 1. 5 oz. of pale shell-lac, dissolved in 1 pint of wood-naphtha, or methylated spirit, or spirits of wine. 2. 5 oz. of pale shell-lac, 1 oz. gum sandarac, 1 pint spirit. 3. 1¼ lb. pale shell-lac, ¼ lb. mastic, 2 quarts spirit. 4. Shell-lac, 6 oz.; spirit or naphtha, 1 pint; linseed oil, ¼ pint. The last is the most easy to apply; it requires no oil on the rubber, and is a very good domestic polish for restoring furniture, if properly applied by careful and continuous rubbing.

FRENCH PROTESTANT CHURCH. See HUGUENOTS.

FRENCH RIVER, a stream of Upper Canada, empties Lake Nipissing into Lake Huron, entering Georgian Bay, in lat. 45° 53′ N., and long. 81° 5′ W

rapid course of about sixty miles; and, its mouth, is so uniform in breadth and to resemble an artificial cut through . It forms part of the route by which referring the Ottawa to the St Lawrence, Montreal to the Red River of the north.

CH SETTLEMENTS. See PONDI-

ON, ÉLIE CATHERINE, a French writer, at Quimper in 1719, educated under the the college of Louis le Grand, and first a reputation by his publication of a critical 1746. This journal appeared under the tle, *Lettres de Madame la Comtesse de * * **, ppressed in 1749, but virtually re-appeared *sur quelques Écrits de ce Temps* (13 vols., 54), and was again continued under the *née Littéraire* (1754—1776). F. exhibited intense bitterness against his leading rries. A worshipper of the age of Louis hated and satirised the levelling philosophy es. Voltaire was the special object of his and that sensitive scoffer was deeply galled weekly diatribes of his antagonist. The Voltaire and F. are inseparably, though not conjoined in the history of literature. F. right in his criticisms and in the accusach he brought against his adversaries, but n France in the 18th c. was swayed by and F. fell a victim to the animosity of He died of grief, March 10, 1776.—LOUIS S FRERON, a son of the former, was born n 1765, played a somewhat prominent part dodrama of the French Revolution, and in sent as sub-prefect to the island of St by the First Consul, but died two months arrival.

CO, FRESCO-PAINTING, or PAINT-FRESCO, the term applied to paintings upon plaster while it is still wet or fresh esco). Many celebrated artists and well-riters have maintained that fresco is the in which the highest efforts in art should lied. A very large proportion of the best the Italian schools, particularly those of Florence, are done in this manner; and ne present century it has been revived, y of the chief paintings of the modern chool are executed in fresco. The practice me extent been introduced into Britain, in works of that kind have been executed, s are in progress, in the new Houses of it.

noticing more particularly the various claimed for fresco-painting, it is proper lescribe the process. A cartoon or drawper is first made of the subject. This must ed with a correct outline, and the shading t fully made out. The finished cartoon er be of the same size as the intended it may be done on a smaller scale; but, at s, an *outline* of the same size as the fresco s necessary. When the finished cartoon is same size as the fresco, it is generally in black and white, with chalk or charcoal, ssential to have also a careful study of the colours, and this is in most cases done on ale. The colours used are mostly earths or as few others will stand the action of lime: ground and applied with pure water. The be painted on is the last or smooth coating that is laid over the rough plaster-work ch walls are prepared. This last coating, , or rather as much of it as the artist or being able to cover in one day is laid on immediately before he commences work. The surface is wet, but firm and smooth; the tracing is laid over the portion prepared, and the artist, with a point of hard wood or bone, goes over the lines of the tracing, and slightly indents them on the plaster. He then proceeds with his work, the finished cartoon and coloured sketch being hung or placed near him for his guidance. After his day's work is over, any portion of the plaster that has not been painted on, or that may remain beyond or at the edge of his work, is cut away; and next day, when the painter is ready to commence work, the plasterer is at hand, and joins closely another portion of plaster to the edge of the portion painted on the previous day, which, when cut, had been slightly sloped. The lime, in drying, throws out a kind of crystal surface, which protects the colour, and imparts a degree of clearness much superior to, and easily distinguishable from, that of a work in tempera or size paint. This process, although apparently simple, nevertheless requires great dexterity and certainty of hand; for the surface of the plaster is delicate, and must not be overworked, besides, the lime only imbibes a certain quantity of additional moisture in the form of liquid colours, after which it loses its crystallising quality, and the surface, or a portion of it, becomes what painters call rotten. Many frescoes are defective in this way. It is only after the lime has dried that such flaws are discovered; the proper plan, in such a case, is to cut away the defective portion, have fresh plaster laid on, and do the work over again. But the flaws are too often retouched with tempera or size colours; and though they may escape notice for a time, the parts touched will change or come off in the course of a few years. Another difficulty in fresco is, that the colours become much lighter after the plaster dries, and for this allowance must be made. However, by practice, the painter may soon get over this difficulty; and he can test the difference between the colour as wet and as dry, by putting a touch on a piece of umber he has generally at hand, which instantly dries the colour, and shews it as it will be when the lime has dried.

The pre-eminence claimed for fresco-painting is founded on—1. The quality it possesses of clearness and exhibiting colours in a pure and bright state. The surface not being dry and dull, as tempera or size colour, nor glossy like oil-paintings, is capable of being favourably viewed from any point. 2. Its durability—many frescoes being painted on arcades or the cloisters of churches open on one side, some on the fronts of houses entirely exposed in the open air. 3. The skill and dexterity required in execution—retouching not being admissible, nor those various appliances of glazing over painting, &c., available in working with oil-colours; all which circumstances compel the fresco-painter to confine his energy more to the subject and design, than to the mechanical qualities so much sought after by painters in oil. The frescoes by M. Angelo in the Sistine Chapel, by Raphael in the stanze of the Vatican, and those in the cupola of the cathedral of Parma by Correggio, are pointed to by the advocates of this mode of art as settling the question.

But, on the other side, it may be said—1. Though a certain degree of clearness and purity of colour results from fresco, it is deficient in depth and richness. The absence of glossiness is no doubt an advantage in the case of mural-painting with reference to architectural decoration; but to a considerable extent this difficulty can be obviated in the case of painting in oil; and Delaroche's great picture of the Hemicycle in the Beaux Arts in Paris, which is in oil, is not objectionable on that ground

—indeed, may mistake it for fresco. 2. No doubt, in fresco, the colours are not liable to change much, if the work be executed in pure fresco, and not retouched; but, generally speaking, the surface is fragile, and easily broken or scratched, and there is no way of mending it but by retouching with tempera colours; and if that be extensively done, its nature is altered, and it becomes a picture in size colours. The 'Madonna de Foligno,' 'Madonna di San Sisto,' 'Sposalozia,' and other celebrated easel-pictures by Raphael, are in much better preservation than his frescoes in the stanze of the Vatican. 3. The properties of difficulty in execution and limited range of colouring, and of technical appliances, are of a negative kind. No doubt, some painters have maintained that good colouring is incompatible with grand compositions; but, on the other hand, Titian's 'Entombment' in the Louvre, and Peter Martyr in Venice, among others, are referred to as rebutting such an assertion.

Mural-painting is of great antiquity: in Egypt, in the Etruscan tombs, on the walls of houses in Pompeii, and in the catacombs, there are various remains of paintings which are generally considered to be frescoes; those in Pompeii, in particular, are remarkable for grandeur and purity of style in design and drawing; but they are executed in a slight and free manner, and on this account, and from the same or nearly similar subjects being often found repeated, are supposed to be copies by house-decorators of celebrated paintings that were preserved in temples or palaces at Rome. Whether these were frescoes painted on the walls or movable pictures, is matter of dispute. 'The Greeks preferred movable pictures, which could be taken away in case of fire, or sold if necessary.'—Wilkinson on *Egyptian and Greek Paintings*. Pliny says Apelles never painted on walls; and various pictures of immense value are stated to have been taken from Greece to Rome.

On the whole, it may be assumed as an opinion that has long been generally adopted, that where painting is to be combined with architecture, fresco is the style that assimilates most with it. On the other hand, the fact of Delaroche having so successfully executed in the Beaux Arts a work in oil, which by size and subject was so well adapted for fresco, and the circumstance of the adoption lately in Germany, and by the artists in our Houses of Parliament, of stereochromic painting (see below) in place of fresco—a method by which certain defects in the process of fresco-painting are said to be obviated—militate against the soundness of some of the opinions hitherto adopted as to the advantages ascribed to fresco-painting.

Fresco Secco is a spurious kind of fresco, much used in Italy in ordinary house-decoration. The colours, mixed in water, are laid on the wall after the plaster is dry, and adhere in a certain degree by absorption, the hard or glassy surface which forms on plaster after it dries being first removed by pumice or otherwise. Pictures executed in this manner look coarse and dry, or rotten, and are in every way inferior to pure fresco.

Stereochromic Painting (Gr. *stereos*, firm, and *chroma*, colour).—The ordinary process of fresco secco, however, has lately assumed very great importance from a discovery by the late Dr J. R. von Fuchs of what is called water-glass (see FUCHS'S SOLUBLE GLASS), which, being passed over the surface of a work executed in fresco secco, imparts much brilliancy, and fixes and gives great durability to the colours; this method is styled stereochromic painting, and is now extensively practised in Berlin by Kaulbach and other eminent German artists. The late Prince Albert was so much impressed by the bearing which this discovery would have on the art of mural-painting, that he translated from the German a pamphlet describing the 'manufacture, properties, and application of water-glass (soluble alkaline silicate), including a process of stereochromic painting,' and printed it for private circulation. Mr Maclise, R.A., made use of this new style of art in executing his great picture in the palace of Westminster of the 'Meeting of Wellington and Blucher at Waterloo.'

FRESHWATER HERRING. See COREGONUS.

FRESHWATER MUSCLE, a popular name common to a whole family of lamellibranchiate molluscs, *Unionidæ* (sometimes called *Naiadæ*), allied to muscles (*Mytilidæ*), but having a much larger foot, which does not generally produce a Byssus (q. v.), except in a very young state of the animal. All the known molluscs of this family are inhabitants of fresh water, some of them being found in still, and some in running waters. A few species are European; but it is in North America that they chiefly abound, its lakes and rivers producing many species. They crawl about by means of the foot; many of them generally live immersed in mud. They are supposed to feed on animalcules, and on decomposed animal and vegetable matter. The epidermis of many is brilliantly coloured, and the inside of the shell is lined with a brilliantly and variously coloured nacre, so abundant as to be sometimes used for mother-of-pearl. Pearls are sometimes produced. There are four British species, of which one, *Anodon cygneus*, attaining a size of 2¼ inches long by 6 broad, is common in lakes, ponds, and muddy rivers. It is very variable in the thickness of the shell and in other particulars. The hinge is toothless. Two species are confined chiefly to the south and east of England; the fourth (*Unio* or *Alasmodon margaritifera*, *Mya margaritifera* of Linnæus) inhabits the rivers of mountainous and hilly districts with a rocky bed, and has long been celebrated for the pearls which it

Freshwater Muscle (*Alasmodon margaritifera*).

produces. It is about 2½ inches long by 5 broad, and has a thick blackish-brown shell, with a toothed hinge. It is the most northern European species, and is found in the rivers of Norway and Sweden. The pearls of the British rivers were famous among the ancient Romans; and Suetonius represents them as having formed an inducement for Cæsar's expedition. Some of the rivers of Wales, the north-west of England and Scotland, have at various times produced beautiful and valuable pearls. In the river Earn, a tributary of the Tay, muscle-gathering is quite a trade, and the pearls found form the means of subsistence to many families. A pearl from the Conway, presented by Sir Richard Wynn to the queen of Charles II., is among the ornaments of the British crown. Large and fine pearls have also been procured from rivers of Tyrone and Donegal.

FRESHWATER STRATA are so named from their supposed origin. This can be easily determined from an examination of the contained fossils

ough the great proportion of aqueous rocks are marine origin, yet freshwater strata are occasion- y met with. The yellow sandstones of the Old d or Lower Carboniferous period are freshwater ls, as are also the Burdie-House limestone in Edinburgh coal-field, the Purbeck beds in the lite, the Wealden beds in the Chalk, and the mpstead and other beds in the Eocene period.

FRESNEL, AUGUSTIN JEAN, a French physicist, s born at Broglie, in the department of Eure, h May 1788, educated at Caen at the Ecole ytechnique, and finally at the Ecole des Ponts Chaussées. On the completion of his studies, was sent as government engineer to La Vendée, l afterwards to the department of Drôme, where remained till March 1815. On the return of poleon from Elba, F. offered his services to Bourbons, but ill health prevented him from ively engaging in military life. At the Restora- n, he resumed his duties as government engineer; in the interval he had been devoting his orced leisure to physico-mathematical researches, ticularly the polarisation of light, with so much cess, that although in a letter, dated 28th Decem- 1814, we find him writing to a friend to get some books on the subject, as he did not know at the phrase 'polarisation of light meant' ('Je sais ce qu'on entend par la polarisation de la ière'), yet before the completion of the follow- year, he ranked among the first authorities on question. In ignorance, it is said of the labours Young, F. demonstrated to his countrymen the or of the Newtonian theory of the propagation light by the emission of material particles, and advocated the undulatory hypothesis. The lt of his researches was exhibited in a memoir, rned by the French Académie des Sciences in 9. Along with Arago, he investigated the action cised by polarised rays of light on each other, their discoveries, published in a joint memoir, firmed his previous theory on the mode of the pagation of light. His practical application of the theory to the improvement of the light-house tem, was of incalculable value, and has quite lished the old method of illuminating light- ses. See LIGHT-HOUSES. In 1823, F. was elected mber of the Académie des Sciences; in 1825, mber of the Royal Society of London; and in 7, received from the same Society the Rumford dal for his discoveries concerning light and heat. died July 14, 1827.

FRET, a figure, in Heraldry, resembling two cks laid saltierwise, and interlaced with a mascle.

Fret.

Fretty.

FRETTY. When six, eight, or more pieces are sented crossing and interlacing like lattice- k, the shield is said to be fretty.

FREYJA AND FRI'GGA, though spoken of in thern mythology as distinct, are originally one, l intimately associated with Freyr. Frigga, in the ealogy of the Ases (q. v.), is the supreme goddess, e of Odin, and one of the daughters of the giant rgwyn, and presides over marriages. Freyja is daughter of Niord, sister of Freyr, and goddess ve. She is drawn on a car yoked with cats; to deceased women go, and also the half of those that fall in battle, whence she is called Val-Freyja In this last respect, she must be considered as signifying the Earth; but the earth is also repre- sented by Frigga, the wife of Odin, and when Freyja seeks Odin, as Isis seeks her Osiris, this is Odin conceived as the Sun. The names also, Frigga and Freyja, are in signification almost alike, and the two are often confounded in mythology. The Anglo-Saxons and Lombards worshipped the wife of Odin as Frea. The name yet survives in *Friday*.

FREYR, the son of Niord, of the dynasty of the Vanagods, was adopted with his father among the Ases, who, when he got his first tooth, bestowed upon him the celestial castle Alfheim. He is the god of peace and fertility; dispenses rain and fer- tility; and to him prayers for a good harvest are addressed. His wife is Gerda, daughter of the giant Gymer. F. had seen her as he once ascended the lofty seat of Odin, Hlidskialf, from which every- thing on earth is seen. Gerda was so beautiful, that the brightness of her naked arms illuminated air and sea. Seized with violent love, F. sent Skirnir as spokesman, and for his services had to give him his good sword, which he will miss in the great final contest or eclipse of the gods. Like Freyja, he was the patron of marriage, and probably the two were at one time conceived as united, hermaphro- dite-wise. F. was held in great veneration, especially in Sweden, of which he was patron-god, and also in Iceland. His chief temple was at Upsala, where a bloody offering was yearly made to him of men and animals. His festival was at the winter solstice, the turn of the year—Yule-tide. While the god was borne round the land, all strife was laid aside. (Does 'the procession of the boar's-head,' at Christ- mas-time, commemorate F., who rode on the boar, Gullinbursti, and whose symbol was the boar's- head?) The circumstance that the Saxon form of F.'s name, Fro, has been preserved in the German name of a Christian festival, Fronleichnam (Corpus Christi, the Lord's body), seems to shew that it had become among these peoples the abstract term for a god.

FREYTAG, GUSTAV, a dramatic poet and novelist of Germany, was born 13th July 1816, at Kreuzburg, in Silesia, studied at the universities of Breslau and Berlin, and took his degree in phil- osophy in 1838. His first important work was a comedy, entitled *Die Brautfahrt, oder Kunz von Rosen* (Breslau, 1844). Among his other productions may be mentioned *In Breslau* (Berlin, 1845), which is a collection of small poems written in a popular style; the dramas *Die Valentine* (Leip. 1847) and *Graf Waldemar* (Leip. 1848); and the comedy entitled *Die Journalisten* (1854); most of which were received with warm approbation on their appearance, and are remarkable for the care and refinement which they exhibit in the portraiture of character and the arrangement of incident. An edition of his dramatic works was published at Leipsic, in 3 vols., 1848—1850. But his greatest achievement in literature is undoubtedly *Soll und Haben* (Leip. 1855), a novel of German citizen-life, illustrating its activity, perseverance, and courage- ous loyalty, and thus expressing, as it were, the poetry of honest labour. It passed through five editions in one year, and a seventh was published at Leipsic, in 1858. It has been translated into English under the title of *Debit and Credit* (1858). In 1859, F. published a new classical drama, *Die Fabier*, a second edition of which has just appeared (Leip. 1862). His most recent work is a series of prose pictures from German history, entitled *Neue Bilder aus dem Leben des Deutschen Volkes* (Leip. 1862).

FRIAR, a name common to the members of certain religious orders in the Roman Catholic Church, and generally employed in contradistinction to the name Monk and Regular Clerk (see these articles). The name friar, although from its etymology (*frère*, brother) it belongs to the members of all religious brotherhoods, yet has come to be reserved almost exclusively for the brethren of the Mendicant orders. It is applied chiefly to the four great orders, Dominicans, Franciscans, Augustinians, Carmelites, and later, to the Trinitarians, and to the various branches of these orders. The Franciscans were properly denominated 'Friars Minor' (*Fratres Minorrs*). The Dominicans received, in contrast, the title 'Friars Major,' which, however, was perhaps rather a sobriquet than a serious name. These several bodies of friars, too, were popularly called, from the colour or other peculiarity of their habit, Grey Friars (Franciscans), Black Friars (Dominicans), White Friars (Carmelites) Crutched [or Crouched (*Cruciati*, 'crossed')] Friars (Trinitarians), so called from the cross which was embroidered upon their habit. This is the origin of the names of the several localities in London, and other towns thus designated, to the present day. In the orders to which we refer, the friars who are in priest's orders are styled 'father.' The other members are called imply 'brother.' The vow taken by friars at profession is of the class called in the Catholic Church 'solemn,' and is held to render null and void any contract of marriage entered into by the party subsequently to his religious profession.

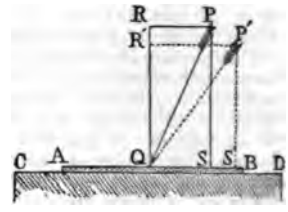
FRIARS' BALSAM. See BENZOIN.

FRI'CTION. When one body rubs against another as it moves, a certain force is felt to resist the motion. This resistance is called *friction*. As a considerable proportion of the motive-power in all operations is spent in overcoming the friction of the parts of the machine upon one another, and is thus lost for the useful work, it is of great importance to understand the nature of this obstructive force, with a view to reduce it to the least possible amount. Accordingly, a great many careful experiments have been made on this subject, and the result is a number of precise and valuable facts or laws regarding friction, which are now considered certain and reliable. The more important may be thus stated and illustrated.

When a block of oak—say a cubic foot, which weighs about 60 lbs.—is placed on a horizontal table of cast iron, the two surfaces being flat and smooth, it requires a force of nearly $\frac{2}{5}$ the weight of the block, or 24 lbs., pulling horizontally, to make it slide along the table. This measures the friction between the two surfaces. Another block of the same size and shape laid on the same table, would require the same force to draw it; and if the two were laid side by side, and fastened together so as to become one block, it would evidently require double the force, or 48 lbs., to draw the double block; the amount of the friction being thus still $\frac{2}{5}$ of the weight, or of the pressure between the two surfaces. But suppose that, instead of being laid side by side, the second block were laid on the top of the first, what is to be expected? Here the weight is doubled as before, but the extent of rubbing surface remains unaltered; it would be natural, therefore, to expect that this would make a difference, and that, though the friction would, of course, be increased, the increase would be less than in the former case. Experiment, however, shews that there is no difference, and that the friction is just double in both cases. In short, the unexpected and important fact is established, that, *within certain limits, the friction of any two surfaces increases in proportion to the force with which they are pressed together, and is wholly independent of the extent of the surfaces in contact.*

The amount of friction between two bodies is thus a constant fraction or proportion of the force with which they are pressed against each other. This fraction differs for the different kinds of surfaces. Thus, between oak and cast iron, it is, as already stated, about $\frac{2}{5}$, or more exactly, ·38; for wrought iron on wrought iron (we speak at present of dry surfaces, without grease or unguent of any kind), it is ·44; for brass upon cast iron, ·22. This constant fraction (expressing the proportion between the pressure of two surfaces and their friction) is called the *coefficient of friction* for these two surfaces.

Another way of illustrating this law of friction is the following, which has an important bearing on the erection of structures, and on mechanics in general. Suppose a slab AB, in contact with another slab CD, of the same or of different material; and that a force PQ presses on AB obliquely. Let QR be the perpendicular to the two surfaces, and draw PR, PS parallel to AB and QR, thus resolving the force PQ into two forces,



one, PS, pressing AB against CD, the other, PR or SQ, tending to make AB slide towards C. It will clearly depend upon the strength of friction between AB and CD, how far the force PQ may be made to decline from the perpendicular without actually causing the one body to slide on the other. Suppose that when the pushing force is brought into the position P'Q, AB is just ready to slip on CD, and that it is a case of oak upon iron; then, since P'S' or R'Q is the force pressing the surfaces together, and P'R' or S'Q the force tending to produce motion, P'R' will be $\frac{2}{5}$ of R'Q. The angle P'QR' is called *the limiting angle of resistance* of the two surfaces AB, CD; for so long as the direction of the pressure PQ is within that angle, the friction of the surfaces will sustain it; but if the obliquity is greater, the surfaces will slip. This is true, independently of the extent of the surfaces in contact; and also of the amount of the pressure; for the stability depends upon the proportion of PR to RQ, and that is the same, whatever is the length of PQ, so long as its inclination is the same.

If the slab CD were tilted up, so as to form an inclined plane, until AB were on the point of sliding, the angle of inclination would be found to be equal to the limiting angle of resistance RQP'.

Knowing the coefficient of friction of any two substances, their limiting angle of resistance is easily found. *Example.*—The coefficient of brick upon hard limestone is ·60; required the limiting angle. Take a line QR' of any convenient length, raise a perpendicular R'P' equal to $\frac{6}{10}$ of QR', and join QP'; R'QP' is the angle required: if measured, it would be found to be about 31. In any structure, then, the obliquity of the thrust between two surfaces of these materials must always be considerably within this limit, in order to be safe.

The *friction of quiescence*, that is, the resistance to the commencement of motion, is greater than the resistance to its continuance; and the more so if the surfaces have been a considerable time in contact. But the slightest shock or jar is sufficient to destroy this cohesion, or whatever it is that constitutes the peculiar initial resistance; so that it is only

stant and regular friction of motion that is
consequence in practice.
on is very much diminished by the use of
r unguents. The coefficient of wrought iron
k, which, in the dry state, is ·49, is reduced
pplication of water to ·26, and by dry soap
The result of experiments on this subject
l to be, 'that with the unguents, hog's-lard
ve-oil, interposed in a continuous stratum
i them, surfaces of wood on metal, wood on
ietal on wood, and metal on metal (when in
, have all of them very nearly the same

a all cases included between ·07 and ·08.'
gives the same coefficient as the other
a, except in the case of metals upon metals,
a the coefficient rises to ·10. In the case of
n wood, black-lead is frequently employed
same purpose.
nost important fact, perhaps, and one that
ardly have been anticipated before experi-
s, *that the friction of motion is wholly inde-
of the velocity of the motion.*
esistance to the motion of a wheeled carriage
s from two sources; the friction of the axle,
inequalities of the road. The resistance of
to the turning of a shaft in its bearings, or
axle in its box, has evidently the greater
, the thicker the journal or the axle is; the
wheels are accordingly made as small as is
nt with the required strength. The resist-
it occurs between the circumference of the
nd the road, constitutes what is called *rolling*
There are on all roads, to a greater or less
visible rigid prominences, such as small
in passing over which the wheel and the
sting on it have to be lifted up against
But even were these wanting, the hardest
elds, and allows the wheel to sink to a
depth below its surface; so that in front of
el there is always an eminence or obstacle,
; is at every instant surmounting and crush-
rn. This is the case even on iron rails,
of course to a much less extent than on any
oad. Now, for overcoming this resistance,
e shewn, on the principle of the lever, that a
heel has the advantage over a small one;
numerous experiments, the fact has been
ablished, that on horizontal roads of uniform
and material, *the traction varies directly as
, and inversely as the radius of the wheel.*
est direction of traction in a two-wheeled
is not parallel to the road, but at a slight
on upward, in proportion to the depth to
he wheel sinks in the road.
perfectly good and level macadamised road,
tion of a cart is found to be $\frac{1}{30}$ of the load;
to draw a ton, the horse requires to pull
force equal to 75 lbs. On a railway, the
is reduced to $\frac{1}{224}$ of the load, or to 8 lbs. per

friction thus acts as an obstruction to
and wastes a portion of the motive-power,
so important uses. It is, in fact, an indis-
e condition, no less than gravity, in the
of every structure, and in every mechanical
on the earth's surface. How essential it is to
movements, we experience when we try to
ice. Even on ice there is still considerable
so that one foot can be slightly advanced
the other; were it altogether annihilated,
d not stir a fraction of an inch, even suppos-
could stand upright. Without friction, a
ould not be planted against a wall, unless
ere a hole in the ground to retain the foot.
t, no oblique pressure of any kind could
be sustained. The advantage of railways consists chiefly in the diminution of friction; but were this diminution carried much further, there could be no motion whatever, at least by means of locomotives. Without considerable friction, the driving-wheels of the locomotive would slide round on the rails without advancing; and this sometimes happens, when particular states of the weather render the rails as if they were greased.

The force of friction is often directly employed in mechanics. It is used, for instance, to communicate motion by means of belts, chains, &c. It is the force that holds a knot. It is specially useful when a machine, with great momentum, has to be checked or arrested in its motion. The best example of this is the *break* used on railways. By means of a system of levers, blocks of wood are made to press against the circumferences of a number of the carriage-wheels; and thus the momentum of a train weighing hundreds of tons, and moving with a velocity of perhaps 50 miles an hour, is gradually destroyed in a wonderfully short space of time.

Friction-wheels are employed to diminish the friction of axles on their supports. Two wheels, of large circumference in proportion to their weight, are placed close together, parallel to each other, and so that the one seems to overlap the half of the other; in the notch thus formed by the upper circumferences of the wheels one end of the axle rests; a similar arrangement being made for the other end. The friction, which formerly acted directly on the axle, is by this arrangement referred to the axles of the friction-wheels, and is, by the laws of mechanics, reduced in the ratio of the circumference of the friction-wheel to the circumference of its axle. In order to render the friction of the friction-wheels themselves the least possible, they are made as light and as large as is practicable.

FRIEDLAND, a small town of East Prussia, in the circle of Königsberg, situated on the left bank of the Alle, 26 miles south-east of Königsberg, in lat. 54° 26′ N. and long. 21° E. Pop. 2581, who are employed in linen-weaving. F. has been rendered famous by the victory obtained there by Napoleon, 14th June 1807, over the Russian forces under Bennigsen. The Russian general found himself unable to cope successfully with an army of 80,000 men, as his own force consisted of less than 50,000 horse and foot; and he was forced to retire after a disastrous battle. He fell back upon the town of Tilsit, on the Niemen, where the treaty between the French and Russian emperors and the king of Prussia, known as the treaty of Tilsit, was drawn up.—FRIEDLAND is also the name of a town in Bohemia, situated on the Wittig, near the Prussian border. It is the capital of a district or duchy of the same name, from which the famous Wallenstein (q. v.) took his title of Duke of Friedland. Pop. of the town, 4400.

FRIEDLAND, VALENTIN, generally called, from his birthplace, *Trotzendorf*, and indisputably the greatest educationist of his age, was a native of Upper Lusatia, and was born 14th February 1490. After the death of his father, in 1513, he went to Leipsic, where he studied under the celebrated Peter Mosellanus and Richard Crocus, acquiring among other things a knowledge of Greek. On the dawn of the Reformation, he proceeded to Wittenberg, where he formed a close intimacy with Luther and Melancthon, and learned Hebrew from a converted Jew. In 1523, he proceeded to Goldberg, in Silesia, as rector of the gymnasium there; left after four years, but returned in 1531, and exhibited the greatest energy in improving the organisation of the school. Success crowned his efforts. The gymnasium of

Goldberg acquired a rare celebrity. Not only from Silesia, but also from Poland, Lithuania, Austria, Bohemia, Hungary, and Transylvania, pupils sought it in great numbers. Often more than 1000 attended at a time, who all dwelt together in buildings set apart for the purpose, and were admirably superintended and drilled. F. had a most wonderful belief in the efficacy of knowledge, and, in particular, placed so high a value on clearness of thought and expression, that he was wont to affirm that only rogues were unintelligible, and that an obscure and confused diction was a sure sign of a knavish disposition. He died at Liegnitz, 26th April 1556. Compare Pinzger's *Valentin Friedland, genannt Trotzendorf* (Hirschberg, 1825).

FRIENDLY ISLANDS, as distinguished from the Fiji Islands (q. v.), generally reckoned a part of them, are otherwise styled the TONGA GROUP. They stretch in S. lat. from 18° to 23°, and in W. long. from 172° to 176°, and consist of about 32 greater, and 150 smaller islands, about 30 of which are inhabited. The great majority are of coral formation; but some are volcanic in their origin, and in Tofua there is an active volcano. The principal member of the archipelago is *Tongatabu* or *Sacred Tonga*, which contains about 7500 inhabitants, out of a total population of about 25,000. The F. I. were discovered by Tasman in 1643, but received their collective name from Cook. Both these navigators found the soil closely and highly cultivated, and the people apparently unprovided with arms. The climate is salubrious, but humid; earthquakes and hurricanes are frequent, but the former are not destructive. Among the products of the islands are yams, sweet-potatoes, bananas, cocoa-nuts, bread-fruit, sugar-cane, the *ti*, hog-plum, &c.; some corn also is grown. The Flora resembles that of the Fiji group; but the native animals are very few.

The F. I. were first visited by missionaries in 1797. In 1827 the work of evangelisation fell into the hands of the Wesleyan Methodists, and after a lengthened and perilous struggle with the savage paganism of the inhabitants, it was crowned with success. Almost all the islanders are now Christians; great numbers can speak English, and, in addition, have learned writing, arithmetic, and geography; while the females have been taught to sew. The various islands used to be governed by independent chiefs, but nearly the whole of them are now under the rule of one chief, called King George, who is not only a Christian, but a zealous preacher of the gospel.

FRIENDLY SOCIETIES. The uncertainties of human life and health, and the effects of these on the well-being of those who are dependent for their subsistence on human labour, are too manifest not to have arrested the attention of men in all ages, and to have taxed their ingenuity to guard against them. It is probable, therefore, that traces of some sort of institution, corresponding more or less closely to the friendly societies of modern Europe, might be found wherever mankind have not depended for their means of living on the spontaneous products of the soil. At all events, they had their prototypes in the cases, boxes, and chests, or kists—as they were called in Scotland as in Germany—of the guilds and corporations of medieval Europe; which were funds not only for maintaining the dignity and ministering to the conviviality of the members, but for providing for the aged and the sick. Mr Turner finds them in Anglo-Saxon England, and, like the other institutions connected with municipal life, they probably formed part of the legacy of the Romans to the Teutonic conquerors of Europe. Friendly societies are a form of mutual insurance, and, like all insurances, they depend on the principle of substituting the certainty which attends the fortunes of large numbers of men for the uncertainty which belongs to the fortune of each. The objects which friendly societies usually contemplate are the securing, in virtue of a small periodical payment during health and vigour, of a weekly sum during sickness, and of a pension after a certain age. In some respects, and for some cases, joining a friendly society is better than becoming a depositor in a savings-bank. Sickness may come before the savings are considerable; or, if considerable, they may be melted away by a long-continued sickness; but after the first weekly payment is made to a friendly society, the member is secure of succour, however long his illness may continue, besides, perhaps, other advantages. It is possible, on the other hand, that a difficulty may be experienced, in certain circumstances, in keeping up the weekly or other periodical payments required to secure the benefits of friendly societies.

It is to be regretted that, of this excellent class of institutions, many are founded upon erroneous principles, or rather upon no principles at all; and it often happens, therefore, that those who trust to them are disappointed, the funds falling short before all claims are satisfied. This was at one time not to be wondered at, as no proper calculations for friendly societies existed; but such is no longer the case, sound calculations being now attainable. Nevertheless, there is still a considerable number of obscure societies scattered throughout the country, proceeding altogether at random, and by which the labouring-classes are induced to misspend large sums. We trust that what we have now to state will be of some service in promoting the establishment of sound societies, and putting an end to such as are of a different kind.

One great mistake in the formation of friendly societies is to assume that each member should pay an equal sum, whatever his age may be. This is unjust to the younger members, who have a less chance of becoming burdensome to the funds than the middle-aged; and, indeed, there is a rising scale of probability of sickness throughout all the years of a man's life. The Highland Society found that, between twenty and thirty, men are liable, at an average, to be half a week indisposed per annum. Between thirty and forty, the average was about two-thirds of a week. At forty-six, it became a full week, at fifty-seven two weeks; at seventy, eleven weeks. Various other partial observations exist; but as it has been found that sickness varies more considerably than mortality with the salubrity of the localities inhabited and the occupations of the members, no absolute reliance can be placed on their results. All of them, however, agree in this, that *increase of years is attended by increased liability to sickness*. Now, a rightly constituted friendly society is bound to advert to this circumstance. To admit all ages at an equal payment, is clearly making the younger members pay for the elder, who should have entered at an earlier age, and been paying all along.

Another great error in the constitution of benefit societies is in making them for a year only. *Yearly societies*, as they are called, usually originate with some individual—often the keeper of a tavern—who advertises that a society will be formed in his house on a particular day. Applicants for admission pay one shilling as entry-money, which goes into the pocket of the originator of the scheme by way of rent. The objects are generally threefold—namely, a fund for sickness and funeral expenses, a deposit fund, and a loan bank. Towards the first, there is perhaps a weekly payment of twopence, or more if necessary, together with the

arising from the loan of money to the
. Towards the deposit fund, there is a
ranging generally from sixpence to two
, the accumulations being received back
e society closes. The money deposited is
d in making loans to such of the members
such accommodation, within the amount of
eral entire deposits for the year, one penny
ad per month being charged by way of

The surplus, if any, of the twopences and
after sick and funeral money, books, and
cessaries are paid, is divided amongst those
who may be clear of the books at the
he society. Some such societies are formed
ntaneous association of persons, who prefer
a room for their meetings, and thus escape
ptations of a tavern; but none of them
e errors of an equality of payments for all
l the yearly dissolution. Should sickness
y one towards the close of the year, he is
n the society dissolves, quite unprovided
use he cannot enter another society in a
sickness. Considered as a deposit for sav-
yearly society is strikingly inferior to the
ank, in as far as the depositor cannot take
ey without paying an exorbitant rate of

Finally, these societies are generally under
of obscure persons, who can give no security
nds placed in their hands, and who in many
become bankrupt or abscond before the
koning. Yearly societies are, indeed, in
oint of view a most objectionable class of
ns, to which working-people would never
t for their ignorance and unwariness, and
tations held out to allure them.

l-constituted friendly society involves, in
place, the principle of payments appropriate
ular ages, as no other plan can be considered
. It stands forth before the working-
s a permanent institution, like the life-assur-
ieties of the middle and upper classes, and
ily requires its members to consider the
n they form with it as an enduring one,
its grand aim is expressly to make provision,
eriod of life, for contingencies which may
another—youth, in short, to endow old age.
rly society, a man is left at last no better
was at first, as far as that society is con-
but the proper friendly society contem-
is enjoying a comfortable and independent
from the results of his own well-bestowed

sential to the character of a proper benefit
hat individuals be not admitted indiscri-
. To take in a person in bad health or of
onstitution, is unjust to those members who
thy, because he is obviously more likely to
ely burden to the funds. Here, as in life-
e societies, it is necessary to admit members
n their shewing that they are of sound con-
and in the enjoyment of good health. And
e well to grant no benefits until after the
has been a year in the society. By these
men are induced to enter when they are
well, instead of postponing the step until
re a pressing need for assistance, when their
ar to get into a benefit society becomes
e than a fraud.

nment has thought proper to lend its aid in
nation of friendly societies, though not com-
. An association of persons forming one,
means of ascertaining the soundness of its
s, and also entitles itself to deposit funds
gs-banks, with the government security,
not less than £3, 0*s.* 10*d.* per cent. per
by submitting the proposed rules to the
barrister appointed to certify them, to whom a fee of a guinea is payable. Under the sanction of government, tables have been formed by Mr John Tidd Pratt, registrar of friendly societies in England, and by Dr Farr, the actuary of the English registrar-general—the former, together with useful instructions in the book-keeping of friendly societies are embodied in the reports by Mr Pratt, printed by order of the House of Commons for the years 1856–1857, and the latter, together with a masterly essay on the mathematical treatment of the subject, are contained in the twelfth report of the registrar-general formerly referred to. On the imperative necessity of acting on correct tables for such a purpose, it would be superfluous to dwell; and the necessity of identifying the rates of any society with such responsible authority is the more apparent, as we are told by Mr Pratt that the 'duty of the registrar, in examining the rules of a friendly society, is confined to the consideration of their being in accordance with law and the provisions of the acts in force relating to such an institution; and that, although the registrar certifies to the *legality* of the rules of a friendly society, it does not follow as a necessary consequence that the constitution of the society is based on good principles, or that the rates of payment are sufficient in amount to guarantee the promised benefits and allowances.' Before quoting any of these tables, we shall endeavour to explain how they are formed.

We have an idea of a benefit society in its simplest form, if we suppose a hundred men, of exactly 33 years of age, to associate, and make such a payment at first as may be sure to afford each man that shall fall sick during the ensuing year one shilling a day during the term of his sickness. Taking, for the sake of illustration, the Scottish Tables, we find that, amongst such a body of men, there will be about 66 weeks of illness in the course of the year. This, multiplied by 7, gives the whole sum required, £23, 2*s.*, or a little more than 4*s.* 6*d.* each, which, less by a small sum for interest, will accordingly be the entry-money of each man. A society of individuals of different ages, each paying the sum which would in like manner be found proper to his age, would be quite as sound in principle as one on the above simple scheme. It is only a step further to equalise each man's annual payments over the whole period during which he undertakes to be a paying member.

A point for consideration, however, is the rate at which the funds of the society may be improved. In most cases, we believe, it is best for such societies to rest content with taking advantage of the privilege which they enjoy by act of parliament, of depositing their money in the funds or the savings-banks, in which case they are sure to obtain for it interest at a rate of not less than £3, 0*s.* 10*d.* per cent. per annum.

Proceeding upon these or nearly similar grounds of calculation, Dr Farr suggests the following plan for insuring lives and granting pensions to the classes who live on wages, by combining the provision for insurance payable in a sum at death, and for annuity to begin at the age of 65. This union deprives the two operations of their chief risks, and there is little loss by the lives being better or worse than the average. The policies of insurance and annuities can be easily valued every year. It would be necessary to add a little to the premiums for expense of management and for fluctuation in interest and values of public securities. The plan is so constructed that the annual premium is invariable, that depositors can at any time discontinue their premium and withdraw their deposits, without invalidating or diminishing the amount of their

policy, or that they can leave the sum in the guarantee fund as an insurance, to a certain extent, on their lives—a great advantage to persons of uncertain life-incomes. The table is calculated for 3 per cent. interest on the deposits. Proprietary and mutual life-offices add 19—40 per cent. to the calculated premiums for profits, expenses, and bonuses; and Dr Farr proposes to add one-fifth—that is, 20 per cent. for a like reason.

Dr Farr's Plan to insure the Lives and grant Pensions to the Working-classes.

Age 20 { Annual Premium to insure the Life, ... £1 } To be discontinued
Annual Premium to provide a Life-annuity, ... £1 } at the age of 65.

No. of Years or Premiums Paid.	Sum of Annual Premiums paid.		Sums in Deposit.		After the Premiums in columns 2 and 3 are paid, the Depositor is insured in the following.	
	For Annuity.	For Assurance.	On Annuity Account.	On Insurance Account.	Sums at Death.	Deferred Annuity, to begin at Age 65.
	£	£	£ s. d.	£ s. d.	£ s. d.	£ s. d.
1	1	1	1 0 0	1 0 0	2 16 9	0 17 5
5	5	5	5 8 0	5 3 2	13 15 4	4 0 11
10	10	10	11 19 3	10 14 10	26 10 1	7 7 8
15	15	15	20 0 1	16 16 3	38 5 2	10 2 8
20	20	20	29 19 7	23 8 8	49 1 10	12 7 7
25	25	25	42 11 6	30 13 0	59 1 1	14 4 0
30	30	30	58 16 11	38 10 1	68 4 5	15 13 2
35	35	35	80 10 0	47 1 4	76 12 11	16 16 3
40	40	40	110 17 1	56 6 7	84 7 9	17 14 2
45	45	45	159 1 9	65 15 11	91 11 0	18 7 5
No further premiums paid.			Diminishing.	Increasing.	Sum insured at death remains constant.	Payment of Annuity commences.

The table reads thus: A person commencing at the age of 20, pays £2 a year until he is 64, and then pays the last premium. He will, at the age of 65, having paid 45 premiums, receive £18, 7*s.* 5*d.*, also the same sum annually for the rest of his life. At his death, his relatives or representatives will be entitled to £91, 11*s.*

Should he wish to discontinue the annual premium on the *insurance account at any time*, the sixth column shews his position from that time; thus, after the fifteenth premium is paid, his life will stand insured to the amount against 15 in column 1 —namely, £38, 5*s.* 2*d.*, the amount in deposit at that time being £16, 16*s.* 3*d.*, which is the *present value* of his interest in the scheme, and which he may be allowed to withdraw, subject to any conditional by-law of the society.

In like manner, the annual premium in the annuity account may be discontinued, and the deposit withdrawn. Thus the same member having paid 15 premiums of £1, is secured in an annuity of £10, 2*s.* 8*d.* per annum, commencing at the age of 65, as before, the present value thereof in deposit on his account being, per column 4 of table, £20, 0*s.* 1*d.*

The importance is evident of commencing the insurance at an early age, and of combining the insurance with a deferred annuity. On both the insurance and annuity account, the premiums may be doubled or trebled, and in that case will provide double or treble the sum insured, as well as double or treble the annuity. With equal premiums, the amount in deposit on the two accounts is little less at the outset than the sum insured, and in a few years exceeds it.

For those who find occasion to go deeper into the subject of friendly societies, with a view to founding such institutions, we would recommend, in addition to the works already mentioned, a careful perusal of that which Mr Charles Ansell prepared for the Society for the Diffusion of Useful Knowledge, and which was published by that society in 1835. Much benefit might also be derived from Mr William Fraser's papers on Friendly Societies, published in Professor Jameson's *Philosophical Journal* in 1827.

The importance of friendly societies came to be so strongly felt in this country, that in 1793 they were made an object of statutory protection and regulation, and very numerous enactments have since been passed regarding them. In 1855, the whole of the subsisting legislation regarding them was repealed and consolidated by 18 and 19 Vict. c. 63. By this act, three registrars are appointed, one for England, and one for Ireland, both to be barristers, and one for Scotland, to be an advocate; all of not less than seven years' standing. The salary of the English registrar is £800, and those of the Scotch and Irish registrars £150 respectively. Under the provisions of the act, any number of persons may establish a friendly society, by subscriptions or donations, for the following objects. '1. For insuring a sum of money to be paid on the birth of a member's child, or on the death of a member, or for the funeral expenses of the wife or child of a member. 2. For the relief or maintenance of the members, their husbands, wives, children, brothers or sisters, nephews or nieces, in old age, sickness, or widowhood, or the endowment of members, or nominees of members, at any age. 3. For any purpose which shall be authorised by one of her Majesty's principal secretaries of state, or in Scotland by the Lord Advocate, as a purpose to which the powers and facilities of this act ought to be extended: provided that no member shall subscribe or contract for an annuity exceeding thirty pounds *per annum*, or a sum payable on death, or on any other contingency, exceeding two hundred pounds.' The rules of the proposed society must be transmitted to the registrar, whose certificate to the effect that it is in conformity with law shall constitute it an established society from the date of said certificate. No money is to be paid on the death of a child, without a copy of entry of the registrar of deaths; and by the subsequent act, 21 and 22 Vict. c. 101, s. 2, it is further provided, no payment shall be made on an insurance on the death of a child under ten years of age, for funeral expenses, without a certificate, signed by a qualified medical practitioner, stating the probable cause of death. The sums payable for the funeral expenses of a child under five are not to exceed £6, or for a child above five and under ten, £10.

FRIENDS, SOCIETY OF, the proper designation of a sect of Christians, better known to the general community by the name of Quakers. Their founder was George Fox (q. v.), born at Drayton, in Leicestershire, in 1624, who at first followed the occupation of a shoemaker, but afterwards devoted himself to the propagation of what he regarded as a more spiritual form of Christianity than prevailed in his day. In spite of severe and cruel persecutions, the Society of F. succeeded in establishing themselves both in England and America. They have, indeed,

n numerically powerful (having at no ded 200,000 members); but the purity gh from the beginning has so honourably led them as a class, has unquestionably a salutary influence on the public at large; spect to certain great questions affecting ts of mankind, such as *war* and *slavery*, beyond all doubt, originated opinions and which, whether sound or erroneous, are confined to themselves, but have widely he mind of Christendom. For an account e eminent representatives of the Friends, iographies of BARCLAY, FOX, PENN, &c. e ourselves here to a brief notice of their ractice, and discipline, as it is laid down rn publications.

ine.—It is perhaps more in the *spirit* than *er* of their faith that the Society of F. other orthodox Christians. They them- rt their belief in the great fundamental Christianity, and even in the substantial most of the doctrinal opinions which they those of other evangelical denominations. le addressed by George Fox and other the governor of Barbadoes, in 1673, confession of faith not differing materi- he so-called Apostles' Creed, except that copiously worded, and dwells with great on the internal work of Christ. The n of Christian Doctrine given forth on the Society in 1693, expresses a belief in sually termed the Trinity, in the atone- e by Christ for sin, in the resurrection dead, and in the doctrine of a final and dgment; and the Declaratory Minute of meeting in 1829 asserts the inspiration authority of the Old and New Testament, vity of human nature consequent on the am, and other characteristic doctrines of orthodoxy, adding: 'Our religious Society, arliest establishment to the present day, ed these most important doctrines of Holy in their plain and obvious acceptation.' rtheless certain that uniformity of theo- nion cannot be predicated of the Friends, than of other bodies of Christians. As 68, William Penn and George Whitehead blic discussion with a clergyman of the hurch, named Vincent, in which they l that the doctrine of a tri-personal God, y that church, was not found in the . though in what form they accepted the hemselves does not appear; and some Penn published a work himself, entitled *Foundation Shaken*, in which, among gs, he endeavoured to shew that the of vicarious atonement and of imputed ess did not rest on any scriptural foun- but in general, the Society of F., in the of their belief, have avoided the technical y of other Christian churches, restrict- elves with commendable modesty to the cripture itself, as far as that is possible, ing, in particular, the knotty points of divinity (see Barclay's *Catechism and of Faith*, published in 1673, where the o the questions—to avoid theological —are taken from the Bible itself). This allowing to each individual the full f the Scriptures, has, of course, rendered more difficult to ascertain to what lividual minds, among the Society, may red in their mode of apprehending and lly explaining the facts of Christianity. cipal distinguishing doctrine is that of t of Christ in man,' on which many of their outward peculiarities, as a religious body, are grounded. The doctrine of the internal light is founded on the view of Christ given by St John, who, in the first chapter of his gospel, describes Christ—the Eternal Logos—as the 'life' and 'light of men,' 'the true light,' 'the light that lighteth every man that cometh into the world,' &c. Barclay taught that even the heathen were illumined by this light, though they might not know—as, indeed, those who lived before Christ *could* not know—the historical Jesus in whom Christians believe. In their case, Christ was the light shining in darkness, though the darkness comprehended it not. The existence of 'natural virtue' (as orthodox theologians term it) among the heathen was denied by Barclay, who regarded all such virtue as Christian in its essence, and as proceeding from the light of Christ shining through the darkness of pagan superstition. These opinions would seem to be somewhat freer than those expressed in the General Epistle of the Society published in 1836, wherein they refuse to acknowledge 'any principle of spiritual light, life, or holiness inherent by nature in the mind of man,' and again assert, that they 'believe in no principle whatsoever of spiritual light, life, or holiness, except the influence of the Holy Spirit of God bestowed on mankind in various measures and degrees through Jesus Christ our Lord;' but, on the other hand, in a little treatise published by the Society in 1861, it is affirmed that 'the Holy Spirit has always been afforded in various measures to mankind;' while stress is also laid on the statement of St Paul, that 'the grace of God (understood by Friends to signify the 'operation of the Divine Spirit') that bringeth salvation, *hath appeared to all men;*' while another exponent of their views, Mr T. Evans of Philadelphia (see *Cyclopædia of Religious Denominations*, Lond., Griffin & Co., 1853), states that 'God hath granted to all men, of whatsoever nation or country, a day or time of visitation, during which it is possible for them to partake of the benefits of Christ's death, and be saved. For this end, he hath communicated to every man a measure of the light of his own Son, a measure of grace or the Holy Spirit, by which he invites, calls, exhorts, and strives with every man, in order to save him; which light or grace, as it is received, and not resisted, works the salvation of all, even of those who are ignorant of Adam's fall, and of the death and sufferings of Christ; both by bringing them to a sense of their own misery, and to be sharers in the sufferings of Christ inwardly; and by making them partakers of his resurrection, in becoming holy, pure, and righteous, and recovered out of their sins.' Hence it may be safely asserted that they hold a broader (or, as others would say, a more latitudinarian) view of the Spirit's working than any other Christian church or society. In America, about the year 1827, Elias Hicks, a Friend of very remarkable powers, created a schism in the Society, by the promulgation of opinions denying the miraculous conception, divinity, and atonement of Christ, and also the authenticity and divine authority of the Holy Scriptures. About one-half of the society in America adopted the views of Hicks, and are known as Hicksite Friends; their opinions, of course, are repudiated by the rest of the Society, who may be described as Orthodox Friends. The Hicksite schism thoroughly alarmed the latter, both in England and America, and a movement was begun in favour of education, of a doctrinal belief more nearly allied to that of the so-called 'Evangelical' party, and of a relaxation in the formality and discipline of the Society. The leader of this movement was Joseph John Gurney, of Norwich. This

new tendency, however, excited considerable opposition among some of the Friends in America; and the consequence was a division among the Orthodox Friends themselves, and the formation of a new sect, called 'Wilburites,' after the name of their founder, John Wilbur, who are noted for the strictness with which they maintain the traditions and peculiarities of the Society. (See *Friendly Sketches in America*, by William Tallack. Lond., Bennett, 1862.) Some slight indications of theological differences have manifested themselves in England also.

2. *Practice.*—It is in the application of their leading doctrine of the 'internal light' that the peculiarities of the Friends are most apparent. Believing that it is the Holy Spirit, or the indwelling Christ, that alone maketh wise unto salvation, illumining the mind with true and spiritual knowledge of the deep things of God, they do not consider 'human learning' essential to a minister of the gospel, and look with distrust on the method adopted by other churches for obtaining such—viz., by formally training after a human fashion a body of youths chosen on no principle of inward fitness. They believe that the call to this work now, as of old, is 'not of men, neither by man, but by Jesus Christ, and God the Father;' and that it is bestowed irrespectively of rank, talent, learning, or sex. Consequently, they have no theological halls, professors of divinity, or classes for 'students.' Further, as fitness for the ministry is held to be a free gift of God through the Holy Spirit, so, they argue, it ought to be freely bestowed, in support of which they adduce the precept of the Saviour—'Freely ye have received, freely give;' hence those who minister among them are not paid for their labour of love, but, on the other hand, whenever such are engaged from home in the work of the gospel, they are, in the spirit of Christian love, freely entertained, and have all their wants supplied: in short, the Friends maintain the absolutely voluntary character of religious obligations, and that Christians should do all for love, and nothing for money. It also follows from their view of a call to the work of the ministry, that women may exhort as well as men, for the 'spirit of Christ' may move them as powerfully as the other sex. The prophecy of Joel as applied by Peter is cited as authority for the preaching of women: 'On my servants and on my handmaidens I will pour out in those days of my spirit, and they shall prophesy.' They also adduce the New Testament examples of Tryphæna, Tryphosa, the beloved Persis, and other women who appear to have laboured in the Gospel. Their mode of conducting public worship likewise illustrates the entireness of their dependence on the 'internal light.' In other religious bodies, the minister has a set *form* of worship, through which he must go, whether he feels devoutly disposed or not. This seems objectionable to the Friends, who meet and remain in silence until they believe themselves moved to speak by the Holy Ghost. Their prayers and praises are, for the most part, silent and inward. They prefer to make melody in their hearts unto God, considering such to be more spiritual than the outward service of the voice.

The doctrine of the 'internal light' has also led the Friends to reject the ordinances of Baptism and the Lord's Supper as these are observed by other Christians. They believe the Christian baptism to be a spiritual one, and not, like the Jewish and heathen baptisms, one with water; in support of which they quote, among other passages, the words of John the Baptist himself: 'I baptise you with water, but there cometh one after me who shall baptise you with the Holy Ghost and with fire.' Similarly do they regard the rite of the Eucharist: It is, say they, inward and spiritual, and consists not in any symbolic breaking of bread and drinking of wine, but in that daily communion with Christ through the Holy Spirit, and through the obedience of faith, by which the believer is nourished and strengthened. They believe that the last words of the dying Redeemer on the cross, 'It is finished,' announced the entire abolition of symbolic rites; that under the new spiritual dispensation then introduced, the necessity for such, as a means of arriving at truth, ceased, and that their place has been abundantly supplied by the Comforter, the Holy Ghost, whose office it now is to lead and guide men into all truth. The true Christian supper, according to them, is set forth in the Revelations—'Behold I stand at the door and knock: if any man hear my voice and open the door, I will come in unto him, and will sup with him and he with me.' For the same reason—viz., that the teaching of the Spirit is inward and spiritual—the Friends ignore the religious observance of days and times, with the exception of the Sabbath, which some at least among them regard as of perpetual obligation.

The taking or administering of oaths is regarded by Friends as inconsistent with the command of Christ, 'swear not at all,' and with the exhortation of the apostle James—'Above all things, my brethren, swear not, neither by heaven, neither by the earth, neither by any other oath: but let your yea be yea; and your nay, nay; lest ye fall into condemnation.' They have also refused to pay tithes for the maintenance of what they hold to be a hireling ministry, believing that Christ put an end to the priesthood and ceremonial usages instituted under the Mosaic dispensation, and that he substituted none in their place. In consequence, all consistent Friends have been regularly mulcted of plate, furniture, or other goods, to the value of the amount due. The recent conversion of tithe into *rent-charge*, however, has, in the opinion of many Friends, largely removed objections to the payment to this ecclesiastical demand. In regard to the civil magistracy, while they respect and honour it, as ordained of God, they are careful to warn the members of their Society against thoughtlessly incurring its responsibilities, involving as it does the administration of oaths, the issuing of orders and warrants in reference to ecclesiastical demands, the calling out of an armed force in cases of civil commotion, and other duties inconsistent with the peaceful principles of the Society. The Friends have likewise consistently protested against war in all its forms; and the Society has repeatedly advised its members against aiding and assisting in the conveyance of soldiers, their baggage, arms, ammunition, or military stores. They regard the profession of arms and fighting, not only as diametrically opposed to the general spirit of Christ, whose advent was sung by angels in these words: 'Glory to God in the highest, and on earth peace, good-will toward men:' but as positively forbidden by such precepts as—'Love your enemies, bless them that curse you, do good to them that hate you, and pray for them which despitefully use you and persecute you;' also, 'Resist not evil: but whosoever shall smite thee on thy right cheek, turn to him the other also;' and while they acknowledge that temporary calamities may result from adopting this principle of non-resistance, they have so strong a faith in its being essentially the dictate of divine love to the Christian heart, that they believe God, by his wise and omnipotent providence, could, and will yet make it 'mighty to the pulling down of the strongholds of iniquity.' The world, they believe, will by and by confess that the peace-makers are most truly the children of God. The efforts of the Society for the

ion of the slaves are a part of modern
tory. They may most certainly lay claim
cultivated the moral sense of their fellow-
n in regard to this important question.

pline.—By the term discipline the Friends
l 'all those arrangements and regula-
h are instituted for the civil and religious
a Christian church.' The necessity for
pline soon began to make itself felt, and
was the institution of certain meetings or
. These are four in number: the first,
arative meetings; second, the *Monthly*
; third, the *Quarterly* meetings; and,
e *Yearly* meetings. The first are usually
of the members in any given place, in
re are generally two or more Friends of
whose duty is to act as overseers of the
taking cognizance of births, marriages,
movals, &c., the conduct of members, &c.,
ting thereon to the monthly meetings, to
e executive department of the discipline
confided. The monthly meetings decide
of violation of discipline, and have the
cutting off or disowning all who by their
conduct, false doctrines, or other gross
ng reproach on the Society, although the
ave the right of appeal to the quarterly
and from these again to the yearly, whose
are final. The monthly meetings are also
d to approve and acknowledge ministers,
to appoint 'serious, discreet, and judicious
ho are not ministers, tenderly to encourage
young ministers, and advise others, as they,
adom of God, see occasion.' They also
variety of other important duties. The
meetings are composed of several monthly
and exercise a sort of general supervision
atter, and from whom they receive reports,
hom they give such advice and decisions
hink right. The yearly meeting consists
r representative members of the quarterly
meetings. Its function is to consider generally the entire condition of the Society in all its aspects. It receives in writing answers to questions it has previously addressed to the subordinate meetings, deliberates upon them, and legislates accordingly. To it exclusively the legislative power belongs. Though thus constituted somewhat according to Presbyterian order, yet any member of the Society may attend and take part in the proceedings.

Women have also a special sphere of discipline allotted to them: they inspect and relieve the wants of the poor of their own sex, take cognizance of proposals for marriage, deal with female delinquents privately, and under certain restrictions may even do so officially, though in the 'testimony of disownment' they have always the assistance of members of the other sex.

The Society of F., in the multitude of its regulations, has not forgotten the poor; charity in its narrower, as well as in its broader sense, has always been a beautiful feature of its members. The care of the poor was one of the earliest evidences which Christianity afforded to the Gentiles of the superiority and divine character of its principles; and it is honourable to the Society that a similar provision for those united to them in religious fellowship appears to have been one of the earliest occasions of their meetings for discipline. Nevertheless, in accordance with their ruling principle, that all Christian duty should be left for its fulfilment to the spontaneity of Christian love, and not performed under compulsion of any kind, 'the provision for the poor is purely voluntary; its only ground is Christian charity.' It is no small proof of the sincerity of their religious professions—considering the selfishness of human nature—that their liberality is a proverb throughout Britain and America.

Their number at present amounts, it is believed, to about 130,000, of which more than 100,000 belong to the United States.

FRIES, Elias, a distinguished Swedish botanist, was born 15th August 1794, in the district of Femsjö, and studied at Lund, where he became demonstrator in botany in 1828. In 1834 he was translated to the university of Upsala, as professor of practical economics, with which, after the death of Professor Wahlenberg, in 1851, the chair of botany was conjoined. F.'s researches embrace the entire field of botany, *phanerogamous* as well as *cryptogamous* plants, and he was the first to introduce into Sweden the morphological theory, the basis of which is to be found in his *Systema Orbis Vegetabilis* (Lund, 1825). His earliest important work was *Observationes Mycologicæ* (2 vols., Copen. 1815–1818). This was followed by his *Systema Mycologicum* (3 vols. Greifsw. 1821—1829; Supplement, 1830), which was completed in his *Elenchus Fungorum* (2 vols. Greifsw. 1828), and later in his *Nova Symbolæ Mycologicæ* (Upsala, 1851). For another department of cryptoganic botany, the lichens, F. has done great service by his *Lichenographia Europæa Reformata* (Lund and Greifsw. 1831). Among his monographs the *Symbolæ ad Historiam Hieraciorum* (Upsala, 1848), deserves especial mention. He has also written a good deal on the *Flora* of Scandinavia, and especially his *Summa Vegetabilium Scandinaviæ* (Upsala, 1846, *et. seq.*), is reckoned one of his best productions. His *Herbarium Normale* (Upsala, 1847), collected at great expense, and with incredible industry, contains dried specimens of all the rarest plants of Scandinavia. He has also composed a multitude of small dissertations on his favourite subjects, several of which have been translated into German. F. is greatly admired in his native country, and in 1851 was appointed director of the Botanical Museum and Garden attached to the

university of Upsala, and in 1853 rector of the university.

FRIES, JAKOB. FRIEDRICH, the founder of a philosophic school in Germany, was born at Barby, in Prussian Saxony, 23d August 1773, studied at Leipsic and Jena, and in 1805 went to Heidelberg, as professor of philosophy and mathematics. In 1816 he accepted a call to the chair of speculative philosophy at Jena, but was deprived of his professorship, on account of his participation in certain democratic disturbances of 1819. In 1824, however, he was appointed to the chair of physics and mathematics, which he occupied till his death, 10th August 1843. F.'s writings are very numerous. Some of the more important are his *System der Philosophie als evidente Wissenschaft* (Leip. 1804); *Neue oder anthropologische Kritik der Vernunft* (3 vols. Heidelb. 1807; 2d ed., 1828—1831); *System der Logik* (Heidelb. 1811; 3d ed., 1837); *Handbuch der physischen Anthropologie* (2 vols., Jena, 1820—1821; 2d ed. 1837—1839); *Die Lehren der Liebe, des Glaubens, und der Hoffnung* (Heidelb. 1823); and *Geschichte der Philosophie* (2 vols. Halle, 1837—1840). In his philosophy, F. followed the method of Kant, but believing that method incomplete, he sought to supplement by an analytical nature-doctrine (*analytischen naturlehre*) of the human soul, which he designated philosophic anthropology. His *Glaubenslehre*, or Doctrine of Faith, by which he hoped to repair the ravages which the critical philosophy had made upon the certainty of our knowledge, resembles, in some respects, Jacobi's doctrine of the Intuition of the Pure Reason. De Wette adopted it as the basis of his religious philosophy. Some of his disciples, Apelt, Schleiden, Schlömilch, Friedrich Francke, and Schmidt, published at Leipsic in 1848—1849, several philosophic papers, entitled *Abhandlungen der Fries' schen Schule.*

FRIE'SLAND or **VRIESLAND** (ancient *Frisia*). WEST F., which is one of the most northern and wealthy provinces of Holland (q. v.), has an area of more than 1200 square miles, and a population which, in 1858, numbered 270,600. It lies between lat. 52° 40′ and 53° 30′ N., and long. 5° 30′ and 6° 20′ E., and is bounded to the N. by the German Ocean, and to the W. and S.W. by the Zuyderzee. The land, which is flat, and in some parts even below the level of the sea, is intersected by canals and streams in every direction, and abounds in lakes and marshes. The dykes, sluices, and canals, by means of which the country is protected from inundations of the sea, are under the supervision of a special board, which levies an assessment, called a dyke tax, on the land-owners of the province. The lakes and ponds, many of which have been formed by digging for turf, abound with fish; while the older marshes which have been redeemed and drained, form rich pastures, admirably suited to the rearing of horses, cattle, sheep, and pigs. From 4 to 5 million lbs. of cheese and butter are annually exported from F.; while it also yields in excess of its consumption, wheat, rye, flax, hemp, clover, &c. F. is amply endowed with schools and charitable institutions. The inhabitants are principally Calvinists. The chief town is Leeuwarden. The islands, Schiermonnikoog, Ameland, and Terschelling, which lie off the north coast, and are included in the province, carry on extensive fishing operations.—EAST F., which lies between 53° 8′ and 53° 40′ N. lat., and 6° 50′ and 8° E. long., with an area of 1000 square miles, and population (in 1858) of 189,068, is comprised within the Hanoverian district of Aurich, chief town, *Emden*. It is bounded on the N. by the German Ocean, W. by Holland, S. by Aremberg, and E. by Oldenburg. Like West F. it is low and flat, and requires the protection of dykes and sluices. Fishing and agriculture constitute the chief employment of the inhabitants, who are the descendants of the ancient Frisians. This province has frequently changed owners since 1744, when the family of Zirksena, in whose possession it had been for 300 years, became extinct. It was first ceded to Prussia, next incorporated by Napoleon with Holland and France; in 1814 it was restored to Prussia, but in the following year it was ceded by that power to Hanover.

FRIEZE, in classical architecture, the central portion of the entablature (q. v.). It is also called (by Vitruvius) the Zophorus (life-bearing) from its being frequently ornamented with sculpture. From the same cause, the term frieze is sometimes applied to any enriched horizontal band.

FRIGATE (probably connected with the Gothic *fargod*, a row-galley, and also with the Latin *aphractus*, an undecked galley). Formerly, a long narrow vessel propelled by oars and sails, used in the Mediterranean on occasions when speed was requisite. The name then came to be applied to men of war, of a class smaller than line-of-battle ships, and carrying from 20 to 50 guns, which were employed in the great wars of the 18th, and early part of the 19th centuries, as scouts and cruisers. The frigate was usually swift, easily managed, and

Frigate—First Class, 50 guns.

capable of beating well up to the wind. She became, therefore, the favourite ship in war-time, and bore off a large proportion of the prize-money. Frigates also served to obtain information as to the movements of hostile fleets, and to guide the sailing of their own; but it was unusual for them to join in the line of battle, their exploits ordinarily occurring in engagements with single ships of their own class. One of Nelson's commonest complaints was, that he had not a larger number of swift frigates to intercept the enemy's cruisers; it having then been notorious that the French built faster and finer craft than those our dockyards could turn out, although it must be added, that most of these rapid frigates had changed their flag before the war closed.

With steam, and the growth of the fleet in recent times, frigates have been developed more than any other men-of-war, and many of the largest ships now in the navy belong to this class. The Americans set the example of enormous frigates in the *Niagara*, a pattern we have since far outrun in several splendid vessels, such as the *Diadem*, *Mersey*,

and last, the magnificent iron-plated of 6000 tons, three times the burden of in Nelson's fleet.

ATE BIRD, or MAN-OF-WAR BIRD, *es aquilus*, or *Fregata aquilus*, a bird elican family (*Pelecanidæ*), the only well-ed species of its genus, which is allied ormoranta. It is a large bird with black sometimes measuring ten feet—some say teen feet—from tip to tip of its extended

Frigate Bird (*Fregata aquilus*).

Its aërial evolutions are y graceful, and it soars to a great eleva-is said never to dive for its prey, but to es only when they appear at the surface it. Flying fishes constitute no small part d.

GE TREE (*Chionanthus*), a genus of plants atural order *Oleaceæ*, consisting of small large shrubs, natives of America, the West Ceylon, and New Holland. The Common ee or SNOWFLOWER (*C. Virginica*) is found Inited States from lat. 39° to the Gulf of It sometimes attains the height of 20 or ut is rarely more than 8 or 10, has opposite es 6 or 7 inches long, and very numerous ite flowers in panicled racemes. The limb rolla is divided into four long linear seg-hence the name fringe tree. The fruit is lrupe. The tree is frequently cultivated as ental plant.

GES. In optics, those coloured bands of n (q. v.) which appear when a beam of ses the clean edge of a screen, or is ted through a narrow slit or hole, are called

GI'LLIDÆ, a family of birds of the order *s*, tribe *Conirostres*, having a conical or onical bill, sometimes short and thick, es comparatively slender and elongated, es convex above, below, or at the sides, nissure—line of junction of the mandibles it. The neck is short, and neither the the wings are long. The Fringillidæ are birds; they feed chiefly on seeds—to some so on insects. The family is an extremely s one, and distributed over all parts of the epresented in Britain by finches, linnets, , grosbeaks, crossbills, &c., and including ver-birds, bob-a-links, cardinal-birds, why-nagers, &c. Some naturalists extend its limits so as to include in it other groups, as buntings, larks, &c., often regarded as forming distinct families.

FRISCHES HAFF ('Fresh-water Bay'), a large lagoon on the coast of Prussia, south-east of the Gulf of Dantzic. It is rather less than 60 miles in length from north-east to south-west, with a breadth which varies in different parts from 4 to 12 miles, and an area of 318 square miles. It was once entirely walled off from the Baltic by the Frische Nehrung, a narrow spit of land extending for about 40 miles along its northern shore. In 1510, however, the waters of the F. H. broke over the Frische Nehrung, and formed the passage called the 'Gatt,' which unites this shore-lake with the Baltic. The Gatt is only from 10 to 15 feet in depth. All large vessels load and unload at Pillau, which is situated at the mouth of the Gatt, on the shore of the Gulf of Dantzig. Cargoes are conveyed to and from the ports on the F. H. by means of lighters. The Pregel, Frisching, Passarge, and two arms of the Vistula, fall into this lagoon.

FRI'SIANS. The Frisians (Lat. *Frisii*), were an ancient Teutonic racé dwelling, together with the *Batavi*, the *Bructeri*, and the *Chauci*, in the extreme north-west of Germany, between the mouths of the Rhine and Ems. They became tributaries of Rome under Drusus, and for a time remained faithful to the Roman alliance; but, in 28 A. D., they were driven to hostilities by the oppression of their protectors; and although partially subdued, they again rose against the Romans under Civilis. As the Frankish tribes advanced further south, the Frisii spread themselves over the islands which are formed by the embouchures of the Rhine, the Maas, and the Scheldt, and gradually merged into the two branches of the *Frisii majores* and *Frisii minores*, the former occupying the districts west of the Fly or Zuyderzee, and the latter those east of those waters. In the 5th c., a band of the Frisii joined the Saxons and Angles in their invasion of Britain. At a later period, the Frisii of the south-west were brought under the Frankish rule by Pepin d'Heristal, who defeated their leader in 689, and compelled him and his people to embrace Christianity. In 785 the eastern branch of the tribe was brought under subjection by Charlemagne, who despatched Christian teachers to preach the Gospel to them, and who, in 802, defined their rights by the *Lex Frisionum*. Their country was divided into three parts, two of which were annexed, in the partition of the Carlovingian empire, to Louis the German, and constituted East Friesland, while the remainder, forming West Friesland, fell to the share of Charles the Bald. The latter of these provinces was subdivided in the 10th and 11th centuries into the hereditary countships of Holland, Zealand, Guelders cum Zutphen, and the bishopric of Utrecht cum Yssel; and hence the districts still retaining the name of Friesland have been circumscribed to their present limited boundaries, while the distinctive national characteristics of the F. have been obliterated by contact with their neighbours, and their history has merged in that of Holland and Hanover.

The *Frisian language* occupies a place intermediate, in some respects, between Anglo-Saxon and Old Norse. Of all the Teutonic dialects, it shews the closest affinities to English. There is a Frisian literature dating from the 12th century. Our knowledge of Old Frisian is derived from collections of laws, of which each 'Gau' had its own set written down in its own dialect. The *Asegabuch*, a set of laws valid for all Frisians, was composed about 1200. A complete collection of the Frisian laws still extant, was published by Richthofen

(*Fries. Recntsquellen*, Gött. 1840). Since the 15th c., the Frisian has been encroached upon on all sides by the Dutch, the Low and High German, and the Danish; so that of the extensive area over which it once prevailed, it now subsists only in isolated spots, such as the islands of Wangeroge and Heligoland, the district about Leeuwarden, Molquerum, &c. This Modern Frisian is confined to the peasantry, and is not used in the schools or the churches. It is broken up into endless local dialects, each of which is unintelligible beyond the circumscribed district in which it is spoken. Several attempts have been made in the present century to revive the Frisian, by publishing some of the older specimens of its literature. Among these we may instance the *Friesche Rymlerye* of Gysbert Japicx (edited by Epkema, 1824); *Waatze Gribberts brilloft* (Leeuw. 1812); and *It Libben fen Aagtje Ysbrants* (Sneek, 1827). Hettema and the brothers Halbertsma are noted both for their original compositions in Frisian, and for their commentaries on Frisian jurisprudence. Among Frisian vocabularies, the best known are Wiarda's *Alt Fr. Wörterbuch* (1786); Richthofen's *Altfriesisches Wörterbuch* (1840), and N. Outzen's *Glossarium der F. Sprache* (Cop. 1837). J. Grimm and Rask have written on Frisian grammar, and the *Frisisk Sproglaere* of the latter has been translated into Dutch by Hettema (Leeuw. 1832).

FRIT (*Oscinis Frit*, or *Chlorops Frit*), an insect of the same family with the house-fly; an active greenish-black fly of the size of a large flea, which does great injury to barley crops in some parts of the north of Europe. It lays its eggs in the flowers, and its larvæ live on the young grains. Linnæus affirms that a tenth part of the barley in Sweden and Lapland is annually destroyed by it. It is not known in Britain, but is nearly allied to the insects called corn-fly and wheat-fly.

FRITH, or FIRTH (Lat. *fretum*, Gr. *porthmos;* from the same root as Ferry, q. v.), an arm or channel of the sea that is passed or crossed; the opening of a river into the sea.

FRITH, William Powell, R.A., an eminent English artist, the son of an innkeeper at Harrogate, Yorkshire, was born in that town in 1820. In 1840, he first exhibited, at the Royal Academy, London, a scene from Shakspeare's *Twelfth Night*, 'Malvolio before the Countess Olivia,' which at once attracted attention, as giving promise of future excellence. In 1841, his painting of the 'Parting Interview of Leicester and his Countess Amy,' from Scott's *Kenilworth*, evinced a marked improvement in his style and manner. Thenceforth he rose rapidly in public estimation, and his subsequent productions amply confirmed the high anticipations that had been formed of his skill and power. Among the paintings exhibited by him in successive years were the following: 'My Wife would bid both stand up to see which was the Tallest,' a scene from the *Vicar of Wakefield*, in 1842; 'Mrs Page, Mr Ford, Page, Slender, and Falstaff,' from the *Merry Wives of Windsor*, in 1843; 'English Merry-making a Hundred Years ago,' in 1847; 'An Old Woman Accused of Witchcraft in the Time of James I.,' in 1848; and 'Coming of Age,' in 1849; &c. F. was elected an Associate of the Academy in 1845, and a Royal Academician in 1853. In 1854, his 'Life at the Seaside' was one of the leading features of the Exhibition. 'The Derby Day,' exhibited in 1858, and 'Claude Duval,' in 1860, are considered two of the most successful of his performances. For the 'Railway Station' (1862), his latest, and probably his greatest painting, he is said to have received 8700 guineas. His occasional small portraits display, alike with his larger pieces, his complete mastery of his art.

FRI'THJOF'S SAGA, which was probably first written down at the end of the 13th or in the beginning of the 14th c., is an ancient Icelandic myth, which records the life and adventures of the hero Frithjof (properly *Fridhthjofr;* i. e., 'peace-destroyer,') who loved the beautiful Ingeborg, the daughter of a petty king of Norway. After being rejected by the brothers of Ingeborg, and having committed various acts of revenge on his enemies, he comes to the court of the old king Hring, to whom Ingeborg has been married, and is received with kindness. At the death of her husband, Ingeborg is married to her lover, who acquires with her hand the dominions of Hring, over which he rules prosperously to the end of his days. Frithjof is supposed to have lived in the 8th c.; but some writers assign to him a much earlier period. This Saga was included by Björner in his collection *Nordiska Kämpadater* (Stock. 1737); and by Rafu in his *Fornaldar Sögur Nordhrlanda* (Copen. 1829). Attention has of late years been more especially drawn to this ancient Saga, which is, in fact, merely one of a number of similar mythical narratives, in consequence of the distinguished Swedish poet, Bishop Tegner, having selected it for the groundwork of a poem (*Frithjof's Saga*), which was published in its complete form in 1825, and at once became the most popular poem that had ever appeared in Sweden, and raised its author to the height of his reputation. Tegner follows the Saga so closely, that the merits or demerits of the plan of the story must be ascribed more to the original than to himself; but to foreigners the poem scarcely seems to present the excellences that have been attributed to it by Swedish critics. The diversity of metre employed in the 24 cantos, of which each differs wholly from the others, detracts from the completeness of the whole, and produces an inharmonious effect. The *Frithjof's Saga* of Tegner has been translated into several other languages; among the five English translations, we may instance those by R. G. Latham (1838) and G. Stephens (1841).

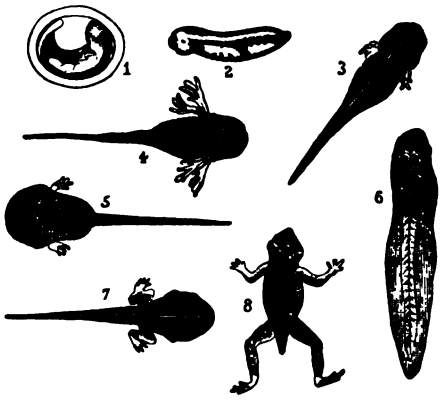
'OLOUS AND VEXATIOUS. By 9 Geo. 2, s. 15, it was enacted, that if the Select tee of the House of Commons, appointed to etition against an election, should be of that any ground of objection stated against was *frivolous* or *vexatious*, they should find aite party entitled to recover the full costs by reason of such objection; and s. 40 , with reference to petitions in general, that mittee, at the time that they inform the of their final determination on the petition, o report whether it did or did not appear to be frivolous or vexatious; and whether osition to it or the return was or was not s or corrupt, in all which cases the parties ly petitioning or objecting are burdened ts. The penalty of paying costs is likewise by 5 and 6 Vict. c. 102, s. 15, on any one who shall bring forward a frivolous or vexatious charge of bribery. See ELECTION. Vexatious indictments for various crimes are prohibited by 22 and 23 Vict. c. 17, which provides that no indict- ment for the crimes therein mentioned shall be preferred without authorisation from one or other of the public officers therein mentioned. The statute does not extend to Scotland. As to frivolous and vexatious actions at law, see 3 and 4 Vict. c. 24, by which a portion of 43 Eliz. c. 6 is repealed; 4 and 5 Vict. c. 28, which again repeals a portion of 3 and 4 Vict. c. 24.

FROBISHER, SIR MARTIN, a distinguished naval adventurer of the Elizabethan period, the first Englishman who sought to discover a north-west passage to China, was a native of Doncaster, but the year of his birth is unknown. For many years, he in vain laboured to impress English merchants with an idea of the importance of a north-west passage; but at length, being patronised by some persons of rank and fortune, he succeeded in raising money enough to fit out two small vessels of 25 tons each, and a pinnace of ten tons. With these he sailed from Deptford on June 8, 1576, the queen, who was then at Greenwich, bidding them God speed on their venturous way by 'shaking her hand at them out of the window.' Steering their course north, they, in lat. 61° N., sighted the southern part of Greenland, which F. took to be the Friesland of Zeno, on the 11th July, to the east point of which F. gave the name of 'Queen Elizabeth's Foreland;' and on the 28th, they sighted *Meta Incognita*. On the 11th of August, F. entered the strait which bears his name, and which forms one of the entrances from Davis' Strait into Hudson's Bay. After about a fortnight's exploration of the coasts and islands, F.—having lost, through the treachery of the natives, a boat and five men—returned to England. He brought with him some ore picked up on one of the islands he discovered, in which some gold was found. Visions of immense wealth to be derived from further search in these northern lands floated before the eyes of the speculators of the time, who immediately fitted out another and better appointed expedition, giving the command to Frobisher. He sailed in May 1577, but his discoveries, hampered as he was by the gold-seeking operations, which turned out comparatively trifling, did not extend further than the neighbourhood of the strait he had before reached. A third expedition was sent out in the year following; but geographical science appears to have been but little benefited by it. F. afterwards served under Drake in the West Indies; and for his distinguished bravery in the fight with the Spanish Armada, July 26, 1588, he received the honour of knighthood. He afterwards commanded a squadron sent out to ravage the Spanish coast. He died on November 7, 1594, from the effects of a wound received while leading an attack by sea against Brest.

FROBISHER STRAIT, a passage between the west side of Davis' Strait and the north side of Hudson's Strait, is 140 miles long, with an average breadth of 20. It extends in lat. from 62° to 64° N., and in long. from 65° to 73° or 74° W. It is not of any practical value as a channel of communication; and, in fact, it has been very seldom visited by vessels bound either westward or eastward,

FROG (*Rana*), a genus of *Batrachia*, having in the adult state four legs and no tail, no gills, four toes on each of the fore-feet, five on each of the hind-feet, the feet more or less webbed; the head flat, the muzzle rounded; the mouth very large, a row of small teeth in the upper jaw, and an interrupted

transverse row on the middle of the palate. The young (tadpoles) breathe by means of gills; external gills forming little fringes at the sides of the neck when they are very young, which, however, in a few days disappear; the gills, which remain until the tadpoles undergo their final metamorphosis into frogs, being very numerous minute crests attached to four cartilaginous arches on each side of the neck, in a cavity to which the water enters from the mouth, and from which it is expelled by one or two small orifices. Tadpoles have no legs, and the body tapers into a tail, and thus has a fish-like form, very different from that of the mature F., the tail being furnished with a membranous border like a fin. The mouth of the tadpole is a horny beak, which falls off when it becomes a frog. When this metamorphosis takes place, the hind-legs grow first, and afterwards the fore-legs begin to appear, the tail being gradually absorbed. Tadpoles are capable of living in water only; but the mature F. visits the water only occasionally, although generally capable of remaining long immersed, and always preferring moist places. In respiration, frogs draw in air through the nostrils, by movements of the muscles of the throat, and expel it by contraction of those of the lower part of the abdomen. The thin smooth skin of frogs is also believed to be subservient to the aëration of the blood. The skeleton is destitute



Frog:
Successive stages—in the order of the numbers—from the egg almost to the perfect frog.

of ribs. The eye is large and very beautiful. The colours are often pleasing, and the general aspect agreeable, in some species very much so, forming a strong contrast to the repulsive appearance presented by toads, notwithstanding the close affinity between them both in structure and habits. The greater proportionate length and strength of the hind-legs enables frogs to leap to a distance wonderful for creatures of their size, instead of crawling as toads do, and their activity and liveliness complete the contrast. The males have on each side of the neck a delicate membrane, which becomes inflated with air when they croak. The power of voice in the females is much inferior. The croaking of numerous frogs in marshy places, or around ponds and ditches, often makes an amusing and curious concert; but the powers of voice possessed by the frogs of Britain are not to be compared with those of the great Bull-frogs (q. v.) of North America; whilst the neighbourhood of Rio Janeiro is enlivened as night comes on by the Blacksmith F., which croaks so sonorously that the noise is like the clanging of a hammer on an anvil, the intermingled voices of some other kinds resembling the lowing of cattle at a distance; and in Peru, there is a F., of large dimensions, which has acquired the name of *Trapichero*, or Sugar-miller, because its voice has a grating sound like that produced by a sugar-mill. The confused blending of the voices of different species of frogs, in these countries, destroying the stillness of night, is one of the things most certain to arrest the attention of the stranger. In colder climates, frogs usually bury themselves in mud, and spend the winter in torpidity. In dry weather, they conceal themselves under shrubs and in tufts of herbage, from which rain quickly causes them to come forth, multitudes often appearing where not one was to be seen before. They feed chiefly on insects, slugs, &c. The beaks of tadpoles are adapted to the eating of leaves and other vegetable food, on which Cuvier says they entirely subsist; but the younger Buckland, in his *Curiosities of Natural History* (4th ed., Lond. 1859, pp. 2—4), in an amusing account of the habits of tadpoles, more correctly describes them as shewing a great avidity for animal food, crowding round a dead kitten, and nibbling at the toes of little boys who wade in pools where they abound. The spawn of frogs is a gelatinous mass, in which the eggs are contained, and which swells greatly by imbibing moisture. Impregnation takes place after it is deposited, as with the spawn of fishes.

The only species of F. certainly known to be British is that called in France the RED F. (*R. temporaria*), which is abundant in most parts of England and Scotland, but is said not to be truly indigenous to Ireland, and to have been introduced into that island in 1696. Its generally reddish colour, varied with black spots and patches, readily distinguishes it from the GREEN F. or EDIBLE F. (*R. esculenta*) of the south of Europe—sometimes said also to have been found in Britain—which is olive green, with yellow stripes along the back, and generally larger than the red species. The south of Europe produces a number of other species, and they are generally more numerous in warmer climates. A remarkable peculiarity is exhibited by some frogs of tropical countries in a hornlike prominence above each eye. These have been separated into a new genus (*Ceratophris*). The TREE FROGS (q. v.), (*Hyla*), the most beautiful and interesting of all, have the extremities of the toes enlarged into a sort of cushion, secreting a viscid humour. Several other genera have been separated from the Linnæan genus *Rana*, but there is a strong family likeness among them all.

The use of frogs for food is generally regarded with disgust in Britain, but it is very common in some of the southern countries of Europe, and they are regarded as particularly delicate. The species chiefly used as food in Europe is the GREEN F. (*Rana esculenta*), already mentioned, which greatly abounds in ponds and slow streams in France, Southern Germany, and Italy. It feeds chiefly on insects, after which it darts with great agility on the banks, and may often be seen swimming with its head above water, or basking in the sunshine. Frogs are there taken for the market by nets, and by a kind of rake. In Vienna, they are kept and fattened in preserves adapted to the purpose. In France, the hind-quarters alone are prepared for the table; in Germany, all the muscular parts. They are dressed in various ways, and with various sauces, of which a great part often consists of wine.—The GRUNTING F. (*R. grunniens*) of the West Indies, a very large species, six or eight inches long, capable of leaping over a five-feet wall, is much used for food, its flesh being very white and delicate, and is often fattened for the table. It shews a considerable capacity for

ation, and readily becomes familiar.—A

which a coat is made.

SSART, JEAN, a French poet and historian,
at Valenciennes, in the year 1337. Being
for the church, he received a liberal educa-
soon displayed a passion for poetry and the
f knightly society. At the age of 20, he
write a history of the wars of his time, and
eral journeys to examine the theatre of the
e was about to relate. The composition
work, which forms the first part of his
s, occupied him about three years (1357—
In its completion, he went over to England,
was received with great favour by Philippa
ault, wife of Edward III. In 1362, she
l him clerk of her chapel and secretary.
rs afterwards, he visited Scotland, where
e the guest of King David Bruce, and
William Earl of Douglas. Everywhere the
ical, quick-witted, and shrewdly observant
an was welcomed and honoured. In 1366,
panied the Black Prince to Aquitaine and
. He afterwards went with the Duke of
to Italy. F., along with Chaucer and
was present at the marriage of this prince,
with the daughter of Galeazzo Visconti,
ted the festivities given by Amadeus VI.,
in honour of the duke. On the death of
ctress Philippa, F. gave up all connection
gland, and, after many adventures, entered
ce of Wenceslaus, Duke of Brabant, as
ecretary. The duke was himself a poet,
ade a collection of his verses, to which he
me of his own, and entitled the whole
, *or the Knight of the Golden Sun*. On the
Wenceslaus, he entered the service of Guy,
Blois, who encouraged him to continue his
s. He now took a journey to the court of
hœbus, Count de Foix, that he might hear
lips of the knights of Bearn and Gascony
nt of their exploits. F. also made several
urneys, to collect information for his
s. In 1394 he obtained the canonry and
ship of the collegiate church of Chimay;
llowing year visited England, where he
eously and generously entertained by King
II.; and on his return spent the remainder
e in completing his great work. He died
y in 1410. F.'s Chronicles embrace the
events occurring 1326—1400. They are valuable documents for illustrating the character and manners of his age. The pageantry of feudal times brightens his pages; the din of arms, the shouting of knights, and the marshalling of troops, is ever and anon heard; while 'visions of fair women' rise before us as we read. The gorgeous feasts and spectacles in which F. so much delighted are set forth in copious details; and though F. is no philosopher, his shrewd observations and richly minute descriptions have helped others to philosophise. F.'s Chronicles first appeared at Paris about the end of the 15th c., under the title of *Chroniques de France, d'Angleterre, d'Ecosse, d'Espagne, de Bretagne, de Gascogne, Flandres et lieux d'alentour*. The best edition is that of Buchon (15 vols., Par. 1824—1826). His poems have likewise been published by Buchon (Par. 1829). The beautiful MS. of the Chronicles in the library at Breslau was executed in 1468, and was secured to the town in a separate article, when Breslau capitulated to the French in the year 1806. The Chronicles have also been translated into Latin and several modern languages. England has two versions: one executed in 1523—1525 by Bourchier Lord Berners (reprinted in 1812); and the other in 1803—1805 by Thomas Johnes (reprinted by Bohn in 1845). The latter is the more exact; but the former, according to Sir Walter Scott, is the more artless and lively.

FROME, or FROME SELWOOD, a parliamentary and municipal borough, in the east of Somersetshire, on the Frome, a branch of the Avon, 12 miles south-south-east of Bath. The surrounding country is very picturesque, and the town, until modernised early in the present century by the formation of two wide thoroughfares, was a strange old place, with narrow, crooked, and steep streets and lanes, many of which still remain. It has manufactures of fine woollens, hats, silk, and cards for dressing woollen cloth. Pop. (1861) 9523. It returns one member to parliament. The once celebrated forest of Selwood was in the vicinity, and part of it, within the parish, remains in its original state.

FROND, in Botany, a term often used to designate the leaves of cryptogamous plants. It was originally introduced as distinctive of organs in which the functions of stem and leaf are combined, and was applied to the leaves of palms, &c. The term *leaf* is now very generally used even as to mosses, ferns, &c., and the term *thallus* is employed as to lichens. In the case of many *Algæ*, the term F. is often used to designate the whole plant except its organs of reproduction.

FRONDE, the name given to a political faction in France during the minority of Louis XIV., which was hostile to the court and the prime minister, Mazarin, and caused great domestic troubles from the year 1648 to 1654. The grasping and despotic policy of Mazarin, to whom Anne of Austria, the queen-regent, had abandoned the reins of government, had given offence to all classes. The princes and nobles saw themselves excluded from all high offices in the state, and their place supplied by foreigners; the parliament was threatened in its political rights, and the people groaned under the burden of taxes and administrative abuses. Parliament, therefore, commenced a course of determined opposition, refusing to register the royal edicts, more especially the disgraceful financial measures. Although the young king, then only nine years old, was obliged by several 'Beds of Justice' (q. v.) to compel the registration of the edicts, and to forbid the opposition of the parliament, the latter did not on that account change its bearing towards the

court. Mazarin, therefore, adopted violent measures. On the 26th August 1648, he ordered the president, Potier de Blancmenil, and the councillor, Peter Broussel, to be arrested. The people took up arms, dispersed the Swiss guard, and on the 27th August (*la journée des barricades*), erected barricades in the streets around the Palais Royal. The court now yielded, repealed several taxes, and promised a better administration of justice. This victory gave parliament courage; those members who continued to keep a sharp look-out on the court measures, and were styled by the adherents of Mazarin *frondeurs* —i. e., censurers (literally, 'slingers')—formed the majority. The court now resolved to suppress the movement, in which the populace of the capital had also taken part, by force of arms, and, on the 6th January 1649, removed secretly to St Germain, leaving Paris to be blockaded by the Prince of Condé with 7000 men. The parliament, whose cause was now publicly espoused by the Prince of Conti, the Dukes of Longueville, Beaufort, Orleans, Bouillon, Elbeuf, Vendôme, Nemours, the Cardinal De Retz, and the Maréchal de la Mothe, called upon the people to resist, and even negotiated with the stadtholder of the Netherlands for an auxiliary corps. In this critical position, the court, on the 11th March, concluded a compact at Ruel, in which both parties missed their object. After the return of the court to Paris in August, a new turn was given to the contest, the princes of the blood disputing the power with Mazarin. This, on the 18th January 1650, led to the sudden arrest of Condé, Longueville, and Conti. This arbitrary proceeding roused the provinces. Marshal Turenne assumed the title of lieutenant-general of the royal army for the liberation of the princes, united himself with the Archduke Leopold, and took several fortified towns, but was finally completely defeated by Mazarin's troops at Rhetel, on the 15th December. Mazarin returned in triumph to Paris, but found all parties against him, and his removal was insisted upon so urgently, that he was obliged to release the princes, and flee to the Netherlands. A disgraceful system of intrigue was now substituted for force of arms, which totally changed the position of parties, and converted the contest which had begun for the interests of the people into a court cabal. Turenne was gained over by the queen-regent, De Retz by Cardinal Mazarin, and Condé was obliged to flee for safety into Guienne. Meanwhile, Louis XIV., who had now attained his 14th year, endeavoured to induce the Prince of Condé to return; but the latter, mistrusting these overtures, repaired to Bordeaux in 1651, where he had many adherents, whence he commenced a regular war against the court, which might have had dangerous consequences, had not Turenne opposed the prince. On the 2d July 1652, an engagement took place between the two parties in the neighbourhood of Paris. Condé was on the eve of being defeated, when the gates of Paris were opened to him by the courage and zeal of his sister, the Duchess of Longueville, and thus a new turn was given to the contest. Paris itself, weary of these fruitless dissensions, now entered into negotiations with the court, demanding the final removal of Mazarin, who had meanwhile returned. This demand was complied with by Louis XIV., and a general amnesty proclaimed. Condé, who refused to enter into the compact, relying upon an army of 12,000 men placed at his disposal by Charles, Duke of Lorraine, quitted Paris on the 15th October 1652, and repaired to Champagne; and finally, finding no one disposed to take up arms in his cause, entered the Spanish service, for which he was declared a traitor. Soon after, Mazarin returned to Paris, and was again intrusted with the reins of government. Thus the royal power came forth victorious from this long contest, which, though it seemed to commence for the popular interests, gradually changed into a miserable party strife among the nobles. Compare Ste-Aulaire's *Histoire de la Fronde* (3 vols., Par. 1827).

FRONTI'NUS, SEX. JULIUS, a Roman author who flourished in the second half of the first century. In 75 A. D. he was sent to Britain as governor of that island, and obtained a great reputation by his conquest of the Silures, and his vigorous maintenance of the imperial authority. He appears to have been twice consul in the course of his life, and to have held several other important offices. He died about 105 A. D. Several works are attributed to F., only two of which are certainly genuine, the *Strategematicon*, a treatise on the Art of War, in four books; and the *De Aquæductibus Urbis Romæ*, in two. The best edition of the first is that of Oudendorp (reprinted with emendations in 1779); of the second, that of Dederich (Wesel, 1841). The *De Aquæductibus* is an important contribution to the history of architecture.

FRO'NTISPIECE, the name generally given to an engraved and decorated title-page of a volume, or an engraving placed opposite the title-page. The term is also sometimes used to denote the front or principal face of a building.

FRONTO, M. CORNELIUS, was born at Cirta, in Numidia, and came to Rome in the reign of the Emperor Hadrian, where he soon obtained a high reputation as a teacher of eloquence. Antoninus Pius intrusted to him the education of Marcus Aurelius and Lucius Verus, both of whom always retained the warmest admiration of their preceptor. F. gradually rose to the highest offices of the empire, became very wealthy, and died, it is thought, about 170 A. D. Until recently, nothing was known of F. as an author, except from a few fragments of a grammatical treatise (*De Differentiis Vocabulorum*); but in the year 1814, Angelo Mai discovered in the Ambrosian Library at Milan a palimpsest, which being deciphered, was found to contain a considerable number of F.'s letters with some short essays. These were published by Mai in 1815; and in the following year an edition was published at Berlin by Niebuhr, who wrote a critical preface, and also printed the commentaries of Buttmann and Heindorf. A few years afterwards, Mai found in the library of the Vatican at Rome another palimpsest containing more than 100 of F.'s letters. The result was a new edition of F. by Mai (Rome, 1823), embodying the new discoveries, which was republished at Celle in Germany (1832). The contents of these letters are on the whole unimportant, although they help to confirm the good opinion which history has formed of the Emperor Marcus Aurelius; and the style is vapid and declamatory.

FRO'SCHDORF (originally, *Crottendorf*), called by the French *Frolsdorf*, is the name of a village in Lower Austria, rather more than 30 miles from Vienna, and not far from the frontiers of Hungary, on the right bank of the river Leitha. It is celebrated for its splendid castle, which in recent times has acquired a kind of political importance, from having been after 1844 the residence of the Duchess of Angoulême and the rendezvous of the elder Bourbon party. After the death of the duchess it came into the possession of the Comte de Chambord (q. v.), who has greatly beautified the interior.

FROSINO'NE (the ancient *Frusino* of the Volscians) is a town of Italy, in the States of the

silt on the slope of a hill above the junc-
e river Cosa with the Sacco, about 48
south-east of Rome, on the high-road
lome and Naples. It is the capital of a
of the same name, which is notorious
dage. The only interesting edifices are

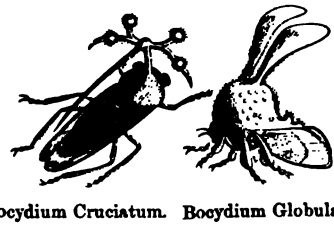
H-FLY, FROTH-HOPPER, FROG-
FROG-HOPPER, the common names of
cts of which the young—larvæ and pupæ
ad in a frothy exudation on plants. They
family *Cercopidæ* of the order *Homoptera*,
llied to *Aphides*, and still more nearly to
nd Lantern-flies. The larvæ and pupæ
le in appearance from the perfect insect
at it possesses wings, which are four in
number, and large. The frothy exudations in which they live are produced from the juices of the plants on which they are found; and as they are often in great numbers, crops of various kinds are not unfrequently destroyed or much injured by them, the plants being weakened by loss of sap. They have a proboscis adapted for piercing the bark of the plants on which they feed. They are all small insects. They have considerable leaping

Frog-Hopper (*Cicada spumaria*):
a, larva; *b*, perfect insect, with wing-covers closed; *c*, perfect insect, in the act of flight; *d*, the froth on a plant.

powers. *Cicada spumaria* is an extremely common species in Britain. The frothy exudation is sometimes called CUCKOO-SPIT, sometimes FROG-SPITTLE, from fancies entertained as to its origin. It is sometimes so abundant, particularly on willow-trees, that persons walking beneath are wetted by its continual dropping. In tropical countries, the *Cercopidæ* are still more plentiful. Some of the tropical insects of this family are remarkable for their extraordinary forms, resulting from peculiar



Bocydium Cruciatum. Bocydium Globulare.

developments of the first segment of the thorax. This is particularly the case in the genus *Bocydium*, of which two species are here figured.

FROUDE, JAMES ANTHONY, an English historian, was born at Totness, in Devonshire, in the year 1818; studied at Oriel College, Oxford, where he took his degree in 1840; and in 1842 was elected a fellow of Exeter College. Having abandoned his original intention of entering the church, he published, in 1847, a volume of stories, entitled *The*

Rainbows of the Clouds; and two years later, *The Nemesis of Faith*, a work in which the solemnity and sadness of religious scepticism are relieved by a singularly tender and earnest humanity. The book was written with great and even startling power, and not only cost F. his fellowship, but also a situation to which he had just been appointed in Tasmania. F., for the next few years, employed himself in writing for *Fraser's Magazine* and the *Westminster Review*. In 1856 appeared the first two vols. of his *History of England from the Fall of Wolsey to the Death of Elizabeth*, and in 1858 the third and fourth. The peculiarity of this work regarded as a *history*, consists in the use it makes of, and the value it places upon, the state documents of the time. The study of these documents has led F. to reverse not a few historical verdicts, especially that which has been passed upon Henry VIII.; but his decisions have by no means been generally, or even to any large extent, acquiesced in by other historical critics. The intellectual vigour and originality of the author's views and sentiments, and the mingled splendour and strength of his style, have, nevertheless, excited an extraordinary interest in the volumes.

FROZEN STRAIT, a passage, if passage it can be called, leading north-westward from Fox's Channel towards Repulse Bay. It separates Southampton Island, in the north of Hudson's Bay, from Melville Peninsula, which stretches northward to the strait of the Fury and Hecla. Its narrowness, for it is only fifteen miles wide, renders it, even in the 66th degree of latitude, almost constantly impervious to navigation.

FRUCTED. Trees when represented as bearing fruit are said heraldically to be fructed.

FRUCTIDOR (Eng. 'fruit-month') was the name given in the republican calendar of France to the period extending from the 18th of August to the 16th of September. The 18th Fructidor of the year 5 (or the 4th September 1797) is celebrated as the day on which Barras, Rewbel, and Lepaux, members of the Directory, by a *coup d'état*, saved the republic from the machinations of the Royalists, who had got the upper hand in the Council of Five Hundred. The execution of the *coup d'état* was intrusted to General Augereau.

FRUCTIFICATION (Lat. the producing of fruit), a term frequently employed in cryptogamic botany, sometimes to denote the whole reproductive system, and sometimes the fruit itself.

FRUCTOSE, or FRUIT-SUGAR, known also as INVERTED SUGAR, occurs in association with glucose, or (according to the recent investigations of Buignet) with cane-sugar in many ripe acidulous fruits. In its composition, and in most of its properties, it closely resembles glucose, from which, however, it differs (1), in being incapable of crystallisation; and (2), in its action on polarised light; while both glucose (or grape-sugar) and cane-sugar exert a right-handed rotation upon a ray of polarised light, this variety of sugar exerts a left-handed rotation; and hence the term *inverted* has been applied to it.

The composition of fructose is represented by the formula $C_{12}H_{12}O_{12}$. When boiled with dilute acids, fructose combines with the elements of water, and passes into glucose. A similar passage of this substance into glucose sometimes occurs spontaneously, as is seen in the gradual crystallisation of the sugar in dried fruits.

It appears to be procurable only from cane-sugar (or sucrose) by the action either of acids or of a peculiar albuminous ferment which exists in the juice of many ripening fruits.

FRUGO'NI, CARLO INNOCENZO, a much admired and versatile Italian poet, was born at Genoa in 1692, and educated for the church. In 1716 he began to teach rhetoric at Brescia, at which time he had already acquired the reputation of being an elegant writer of prose and verse, both in Latin and Italian. In 1719 he taught in Genoa, and subsequently at Bologna. At the court of Parma, through the patronage of the Cardinal Bentivoglio, he was appointed poet laureate, the stated and prescribed compositions of which post were highly uncongenial to his original and discursive muse; nevertheless the Dukes of Parma shewed particular favour to the poet, who returned to Genoa on the death of Duke Antonio, and the accession of the Spanish Infante. In 1733, Pope Clement XII. released F. from his spiritual vows, which had at all times been highly distasteful to him. A grand ode, in celebration of the capture of Oran by the Spaniards, and some other poetic addresses to the king and queen of Spain, reinstalled the poet in his former post at the Parmese court. He died in 1768. His numerous writings were published at Parma, 1779, and a complete edition at Lucca, 1779. A selection from his works appeared at Brescia, 1782.

FRUIT (*fructus*), in the botanical use of the term, in phanerogamous plants, is a mature ovary containing a seed or seeds; and in cryptogamous plants, a spore-case (*sporangium* or *theca*) containing spores. Other parts of the flower, most frequently the calyx, sometimes remain after flowering is over, undergo a further development, become incorporated with the ovary, and form part of the fruit. The development of the fruit in phanerogamous plants depends upon the fertilisation of the ovules, and when this has not taken place, the flow of sap to the ovary usually soon ceases, and it drops off with all the other remains of the flower; although there are exceptional cases of seedless fruits, as seedless oranges, bananas, grapes, barberries, &c., in which, however, it may be supposed that fertilisation takes place, and that unknown causes afterwards operate to prevent the development of the seed, and to direct the flow of sap more exclusively to the nourishment of the succulent parts, which are thus increased and improved. This supposition is rendered more probable by the circumstance that the production of seedless fruits appears to be at least sometimes a consequence of age and diminished vigour in trees.

The fruit, like the ovary, may be composed of one carpel, or of more than one. But the fruit sometimes differs from the ovary, through the development of some of the parts, and the non-development or obliteration of others; so that an ovary with several cells may be converted into a one-celled fruit; and of several ovules, all but one may become abortive, so as to produce a one-seeded fruit. Thus the three-celled ovary of the oak and of the hazel, with two ovules in each cell, becomes, by the non-development of two cells and five ovules, a fruit with one seed; and the two-celled ovary of the ash, and the three-celled ovary of the cocoa-nut, likewise produce one-celled and one-seeded fruits. Sometimes also false dissepiments are formed, which produce in the fruit a greater number of cells than existed in the ovary. More generally, however, the fruit agrees with the ovary in the number of its cells and seeds. But not unfrequently, the structure of the fruit is rendered comparatively difficult to determine, through the development of succulent matter or pulp, sometimes in one part and sometimes in another.

ll that is external to the proper integuments of seed in the ripe fruit is called the *pericarp* (Gr. around; and *karpos*, fruit); and this, which s extremely in size and other characters, usually ists of three layers, the outermost of which is d the *epicarp* (Gr. *epi*, upon); the middle one, *mesocarp* (Gr. *mesos*, middle), or sometimes the carp (Gr. *sarx*, flesh); and the innermost, the *carp* (Gr. *endon*, within). These parts exhibit t variety, but it is generally the mesocarp which mes succulent or fleshy, as in the peach, cherry, , and other drupes; and in the pear, apple, and r pomes. In drupes, or stone-fruits, the endocarp e hard shell which immediately covers the seed;

Drupe (section of a Peach).

omes, it is the scaly lining of the seed-bearing ies in the centre; in both drupes and pomes, picarp is the outer skin. So in melons, cucum- and gourds, the succulent part is the mesocarp, ly developed, with a thin epicarp and a thinner carp. In the orange, however, and all of that ly, the epicarp and mesocarp together form the whilst the pulpy cells belong to the endocarp. erries, as the gooseberry, grape, &c., the pulpy er does not belong to any of the layers of the arp, but is formed from the placentas of the t.

hen the fruit, as the fully developed ovary, is dered as a modified leaf or leaves, the epicarp wed as representing the epidermis of the lower ce, the endocarp the epidermis of the upper ce, and the mesocarp the substance (*parenchyma*) of the leaf. The midrib of the leaf is traced ne *dorsal suture* of the fruit or of each component carpel, and the *ventral suture* is formed by dding together and the conjunction of its edges. dorsal and ventral sutures are very obvious in pods of pease, beans, &c.; and even in fruits ed of several carpels intimately combined, they become very apparent when the ripened fruit s to allow the escape of the seeds. The opening *hiscence* (Lat. *dehisco*, to open) of fruits takes in various ways; thus, the fruit sometimes ves itself into its original carpels by separation ugh the *dissepiments*, which divide into two s forming the sides of the valves, and the ds further open by their sutures; the pericarp times splits at once by the dorsal sutures of carpels; sometimes it divides transversely, and s off a lid; sometimes it opens more partially ves, &c. Many fruits, however, are indehiscent, of which are fruits having a very hard peri- as nuts, and some are fruits having a soft arp and much pulp. The decay of the pericarp these cases necessary to the liberation of the , unless when this is accomplished by such s as the fruit becoming the food of animals, by h also the seeds of plants are often widely dis- ted. The decay of the pericarp seems intended, any cases, to provide the first nourishment for oung plants which spring from the seeds.

A classification of the different kinds of fruits is extremely difficult, although they afford characters of great importance in descriptive and systematic botany. A convenient primary division of fruits is into those which are formed from one flower, and those which are formed by incorporation of the ovaries of many flowers. Fruits formed from one flower, by far the most numerous of these two classes, are divided into *apocarpous* and *syncarpous*, or into *apocarpous*, *aggregate*, and *syncarpous*. Apocarpous fruits are formed of one carpel, and are either dry or succulent, dehiscent or indehiscent, one-seeded or many-seeded. Aggregate fruits, sometimes included among the apocarpous, are formed of several or many free carpels; sometimes dry, sometimes succulent; sometimes arranged on a convex or elevated receptacle; which becomes succulent in the strawberry, and constitutes the edible part of the fruit; sometimes within a concave receptacle covered by the enlarged tube of the calyx, as in the rose. Syncarpous fruits are formed of several carpels, intimately united in their mature state, so as to form a berry, capsule, pome, silique, &c. Syncarpous fruits sometimes so completely resolve themselves into their original carpels, that these may be regarded as becoming separate achenia. Fruits formed by incorporation of the ovaries of many flowers (collective or anthocarpous fruits) are sometimes dry, as the cones of firs; sometimes succulent, as the pine-apple, the mulberry, and the fig. For further notice of different kinds of fruits, we must refer to particular articles in which they are described, as achenium, berry, capsule, drupe, nut, pome, pod, silique, &c., and to articles on the plants which produce them.

A few plants, particularly the *Coniferæ* and *Cycadaceæ*, produce seeds really naked or destitute of pericarp. Many other seeds were formerly often described as naked, in which the pericarp exists intimately incorporated with the seed, as the seeds of grasses, *Borragineæ*, *Labiatæ*, *Umbelliferæ*, &c. Their real nature is often made apparent by some trace of the style.

The production of ripe fruit is exhaustive to the energies of a plant, and plants ordinarily annual may be preserved in life for several years by preventing it. Very young fruit-trees generally fail to bring fruit to perfection, and the first flowers of melons and gourds are often, for a similar reason, abortive; whilst, on the contrary, any circumstance that favours an accumulation of sap in a particular season, tends to render fruit-trees unusually productive in the next, as when the whole blossoms of a year are killed by frost, or when, from the coldness of the previous summer, flower-buds have not been formed in abundance. Whilst the vital energies of a plant are directed mainly towards the increase of its size, flower-buds are sparingly formed or not at all, as is often the case with fruit-trees growing very luxuriantly, and various modes are adopted to cause the production of flower-buds and of fruit by checking this luxuriance of growth, as by root-pruning, by cutting into the stem of wall-trees to a moderate depth, or by taking off portions of the bark of the stem. Grafting (q. v.) is also of use in this respect, as well as for the propagation of improved varieties of fruit-trees, the qualities of which would, in all probability, not be found exactly the same in their offspring by seed.

In a very immature state, fruits are in general green and soft, and decompose carbonic acid gas in the sunlight, absorbing the carbon, and setting free the oxygen, like leaves and other green parts of plants. As they advance towards maturity, some of them become externally dry and hard, and cease to perform by their surface these functions of

vegetation; others, as they become more succulent, change their colour, and instead of absorbing carbon and liberating oxygen, absorb oxygen from the atmosphere, and exhale carbonic acid.

It would not be easy to enumerate the peculiar substances which are produced in fruits. Different parts of the same fruit are often extremely different from one another, as the milk and the kernel of the cocoa-nut, its hard shell, and its fibrous husk. Seeds are indeed generally very different in all their qualities from the pericarp or the pulp by which they are surrounded, and the integuments of the seed often not less different from the embryo, of all which a ready illustration may be found in the apple or the grape. The most different chemical products of vegetation are sometimes to be found in different parts of the same fruit, giving them the most varied qualities, as wholesome and poisonous; the succulent part of the fruit, from the kernel of which strychnia is obtained, is said to be harmless, and the seeds of plums contain so much hydrocyanic acid, that to eat many of them would be dangerous; the capsule of the poppy yields opium, but its seed contains nothing of the kind, and is bland and nutritious, abounding in a wholesome fixed oil. The value of fruits to man—which may safely be asserted to exceed that of all other parts of plants—sometimes, as in the corn-plants, chiefly depends on the farinaceous matter of their seeds, containing starch, gluten, &c.; sometimes, as in the banana and bread-fruit, on the starchy matter of the pulpy part; sometimes, as in nuts, on fixed oils; sometimes, as in many succulent fruits, on sugar and various acids, with gum, pectine, &c. Other fruits, or parts of the same fruits, are valuable for the volatile oils which they yield, and for peculiar principles capable of application to medicinal and other uses, or making them capable of being used as condiments, perfumes, &c. Coffee, cocoa, pepper, vanilla, and many other articles of commerce, are obtained from fruits.

Whilst some fruits are of the highest value as articles of food, others are generally regarded rather as articles of luxury; yet the abundance of succulent fruits in tropical climates is a bountiful provision for real wants, contributing much to the health of the inhabitants. The coolness of succulent fruits renders them peculiarly grateful amidst the heat of the tropics; their temperature, when newly gathered, being much below that of the surrounding atmosphere.

Cultivated Fruits.—In its popular use, the term fruit sometimes has almost the same signification as in the language of botanical science; sometimes it is employed as almost exclusively designating the edible succulent fruits. We cannot attempt an enumeration of edible fruits; many will be found noticed in other botanical articles; we can only here observe that they belong to many and very different natural orders, both of endogenous and exogenous, but chiefly of exogenous plants. We propose, however, to conclude this article by an enumeration of the principal cultivated succulent fruits, including those which are important as articles of food or of commerce.

ENDOGENOUS PLANTS.

Musaceæ.	Plantain and Banana.
Bromeliaceæ.	Pine-apple.
Palmæ.	Date.

EXOGENOUS PLANTS.

Moraceæ.	Fig.
	Sycamore.
	Mulberry.
Artocarpaceæ.	Bread-fruit.
Lauraceæ.	Avocado Pear.
Solanaceæ.	Love-apple, or Tomato.
	Egg-plant.
Sapotaceæ.	Mammee Sapota.
	Sapodilla.
	Star-apple.
Ebenaceæ.	Date Plum.
	Kaki.
Oleaceæ.	Olive. [Differs very much in its nature and uses from all the other fruits here enumerated
Vacciniaceæ.	Cranberry.
Cornaceæ.	Cornel.
Myrtaceæ.	Rose-apple.
	Malay Apple.
	Ugni.
	Guava.
	Pomegranate.
Grossulariaceæ.	Gooseberry.
	Red (and White) Currant.
	Black Currant.
Cactaceæ.	Prickly Pear, or Indian Fig.
Cucurbitaceæ.	Melon.
	Water-melon.
	Cucumber.
	Pumpkin.
	Squash.
	Gourd.
Passifloraceæ.	Granadilla.
Papayaceæ.	Papaw.
Rosaceæ.	Apple.
	Pear.
	Quince.
	Medlar.
	Loquat.
	Peach and Nectarine.
	Apricot.
	Plum.
	Cherry.
	Raspberry.
	Strawberry.
Leguminosæ.	Tamarind.
Anacardiaceæ.	Cashew-apple.
	Mango.
	Hog-plum.
	Otaheite Apple.
Rhamnaceæ.	Jujube.
Oxalideæ.	Carambola.
Vitaceæ.	Grape.
Sapindaceæ.	Akee.
	Litchi.
	Longan.
	Rambutan.
	Honey Berry.
Malpighiaceæ.	Barbadoes Cherry.
Clusiaceæ.	Mammee Apple.
	Mangosteen.
Aurantiaceæ.	Orange.
	Lemon.
	Citron.
	Shaddock.
	Forbidden Fruit.
	Lime.
	Wampee.
	Marmelos.
Sterculiaceæ.	Durion.
Anonaceæ.	Custard Apple.

Nuts, and along with them some fruits, which although not botanically nuts, resemble them in qualities and uses, will be noticed in a separate article.

Chemical Composition of Fruits.—Our principal knowledge of the composition of different kinds of fruit is due to the recent investigations of Fresenius, which are published in the *Annales de Chemie und Pharmacie* for 1857. In that memoir he gives the results of upwards of fifty analyses of different fruits, including gooseberries, currants, strawberries, raspberries, mulberries, grapes, cherries, plums, apricots, peaches, apples, and pears. We select the following analyses as representing the composition of some of our most import-

s, (1) the gooseberry; (2) the grape; (3) r; (4) the peach; (5) the apple; and (6) the r the purpose of comparison, the free acid which is present, whether it be malic, citric, or tartaric (all of which occur in fruits), is calculated as hydrated malic acid.

nd fruit-sugar or fructose, are described in es devoted to these subjects. Under the Soluble Pectine, Gum, &c.,' are included matters, fatty or oily matter in a state of , and organic acids in combination with We shall endeavour to explain briefly the the substances designated in these analyses and pectose. The term *pectine matters* is a very widely distributed class of sub- occurring in the vegetable kingdom, and abundant in fleshy fruits and in roots, properties and composition require further ion. The substance termed *pectose*, which e in water, occurs in plants, which likewise ferment in solution which converts pectose e, which is soluble in water, and is the stituents of apple and other fruit jellies. g to Fremy, *pectic acid*, which is closely ectine, is formed in fruits that yield jellies: signed formulas to both these substances, are not generally accepted.)

tio in which the free acid stands to the es extremely. For a unit of free acid, the represented by 1·63 in plums, by 3·00 in by 4·37 in strawberries, by 4·93 in goose- 7·03 in damsons, by 11·16 in apples, by sweet cherries, by 20·18 in grapes, and by pears; the percentage of sugar is least cent.) in peaches, and greatest (14·93 per grapes; while the percentage of free acid pears (0·07 per cent.), and greatest in 2·04 per cent.).

us observes, that as all the fruits contain s or proteine matters, they are serviceable orming food; but the albuminous matters nt in such small quantity, that these not serve without other nitrogenous food he body in health. Thus, to obtain an f albuminous matter equivalent to the of one egg, we must eat more than a pound s, nearly a pound and a half of grapes, ls of strawberries, more than two pounds of apples, or four pounds of pears. They ver, of more use as respiratory or heat- ds. Fresenius calculates that 1 pound of hich is equivalent to about 5·5 pounds of may be replaced by 5·4 pounds of grapes, rries or apples, 10·8 of currants, or 12·3 erries. Fruits are, however, taken not so their amount of material nourishment, eir vegetable salts (which are of great o utility), and for their agreeable flavour. g the connection between the flavour hemical composition of fruits, Fresenius the former depends (1) on the ratio in acid stands to the sugar, gum, pectine, ast-named substances masking the ratio the acid stands to the sugar); (2) on the presence and delicacy of the aroma; (3) on the proportions between the soluble matters, the insoluble matters, and the water; thus, we usually attach the highest value to those fruits which contain the largest amount of soluble, and the smallest amount of insoluble matters—a peach or a greengage almost melts in the mouth, because these fruits are relatively poor in cellulose and pectose; while, on the other hand, bilberries represent the opposite extreme, and are rich in insoluble ingredients; (4) on cultivation, which is found to cause an increase in the quantity of sugar, and a diminution of the amount of free acid and of insoluble matters; (5) and on favourable seasons, which augment the sugar and other soluble constituents.

The different berries contain, as a general rule, a larger proportion of free acid than stone-fruit or apples and pears; and their acidity is the more obvious to the taste from their containing relatively small quantities of gum and pectine. The following remarks on some of our common varieties of fruits are of practical value.

In *gooseberries*, we recognise an agreeable proportion between the sugar and the acid, the ratio being as 6 to 1 in the sweeter kinds, and 4 to 1 in less sweet varieties of this fruit. The yellow kinds are far richer in soluble ingredients than the red.

Currants are so acid to the taste, that they are almost always eaten with sugar; the ratio of the sugar to the acid being about 3 to 1.

In *strawberries*, it is the aroma that we chiefly prize. The ratio of the sugar to the acid varies with the season and the species from 2 to 1 to 6·7 to 1 (in the pine-apple strawberry).

A similar remark applies to *raspberries*. In wild raspberries, the ratio is as low as 1·8 to 1, while in cultivated kinds it is as high as 3·5 to 1.

Grapes exceed all other fruits in their amount of sugar, which is seldom less than 12, and sometimes reaches 26 per cent. In good kinds, and in favourable seasons, the ratio of the sugar to the acid is as 29 to 1; in inferior kinds, and in ordinary seasons, it is as 16 to 1; when the ratio falls to 10 to 1, the grapes are unripe and acid. In other fruits, this would be a high ratio, and they would be regarded as sweet. The anomaly may be thus explained. In unripe grapes, the skins are very thick, and contain an extremely acid juice, which overcomes the sugar contained in the interior of the berry. The juice of such grapes is found to be far sweeter than the grapes themselves.

From their large amount of sugar, and from the fact that their acidity for the most part depends on the acid tartrate of potash, which is almost entirely precipitated from the wine, grapes are incomparably superior to any other fruits in the preparation of wines; and in their fermentation, different varieties of ether of a delicate odour are formed, which, in

association with volatile oils that are also present, communicate to the more valued wines their special *bouquet*.

The ratio of the acid to the sugar in the must (the expressed juice before the commencement of fermentation) affords the best evidence of the season. Thus, in the very bad wine-year of 1847, the ratio was 1 : 12; in the better wine-year of 1854, it was 1 : 16; while in the good wine-year of 1848 it was 1 : 24, the same kind of grape being experimented upon in all the cases.

Apricots and *peaches* consist almost entirely of juice, their solid constituents, after the removal of the stone, being only 1 or 2 per cent. These fruits are esteemed both for their juicy and tender flesh, and for their powerful but delicate aroma.

In *apples* and *pears*, we have an increased quantity of cellulose and pectine, and consequently a relative preponderance of the insoluble constituents. The cellulose contributes to the firmness or hardness of these fruits, while it is to the pectine that they owe their property of gelatinising when boiled. The well-marked differences of taste, &c., presented by different kinds of apples and pears, are due to the very varying relations that occur between the acid, the sugar, and the pectine, to the greater or less abundance of cellulose, and to the varying nature of the aroma. For equal quantities of sugar, pears contain less acid than apples. In the different kinds of dessert apples, the ratio of the sugar to the acid ranges between 12 to 1 and 22 to 1, while in cooking-apples it averages not more than 8 to 1.

The chemical changes which take place in the fruit during the process of ripening are described in the article PHYSIOLOGY, VEGETABLE.

Keeping of Fruit.—Many of the finest fruits undergo very speedy decomposition; and on this account, some of those most highly esteemed in the countries which produce them, have never become articles of commerce, and are only to be enjoyed—except in the state of *jam* or *preserves*—during the season of their ripening. Decomposition takes place most rapidly when fruits are exposed to the air, and particularly to stagnant air, when there is any dampness about them, and when they are subjected to considerable or frequent changes of temperature. Grapes are imported into Britain from the south of Europe, packed in saw-dust. Unripe gooseberries are kept for making tarts in winter, in bottles or jars, filled up with perfectly dry sand, saw-dust, bran, or the like, closely corked and sealed, after a gentle heat has been applied to expel moisture as much as possible, and placed in a moderate and equable temperature, which is sometimes accomplished by burying them to some depth in the earth. A similar method may be employed with many other fruits. Pears, the finest kinds of which are very apt to rot almost immediately after they reach their perfect maturity, may be kept for months in glazed earthen-ware jars very closely covered, and placed in a cool airy situation, out of the reach of frost. The layers of fruit are separated by the substance used for filling up the interstices, and the pears of the same layer are likewise kept apart, that rottenness in one may not infect the rest, which, with every kind of fruit, is very apt to take place. Another method is to keep them in drawers, the temperature being carefully regulated. Large gardens are often provided with a fruit-room, in which shelves and drawers are allotted to the different kinds of fruit. A moderate and equable temperature, dryness, and careful ventilation, are the principal requisites of the fruit-room. Fruit intended for keeping should be carefully gathered, when almost quite ripe, and all bruising avoided. Pears or apples shaken from the tree cannot be expected to keep so well as those gathered by the hand. Of all the succulent fruits produced in Britain, the apple keeps best, and is therefore most generally used. Fruit intended for keeping is sometimes *sweated* before being placed in the jars or shelves; being laid in heaps for a short time—varying according to the kind of fruit, and extending, in the case of winter-apples to a fortnight or more—that some of the juice may exude through the skin; but the propriety of this practice is doubtful. Some kinds of winter pears and apples can scarcely be said to be ripened till after they are placed in the fruit-room; and medlars are not fit for use till they have reached a state of incipient decay.

FRUIT-GARDEN. Some kinds of fruits have been cultivated from the earliest historic ages. To say nothing of the garden of Eden, and the vineyard which Noah planted after the Deluge, we find in the books of Moses evidence that the cultivation of fruits was much practised in Egypt before the time of the exode of the Israelites; and amongst the Babylonians, the Persians, the Chinese, and the inhabitants of India, it can in like manner be traced back to the most remote antiquity. The Greeks and Romans probably derived their knowledge of the art, as well as many of their finest varieties of fruit-trees, from the East; Charlemagne required attention to be paid to it throughout his wide dominions, and contributed much to its extension in regions of Europe previously too rude for its prevalence; and during the middle ages it was most successfully prosecuted by the monks in the gardens of the monasteries.

The grape, the fig, the melon, and the pomegranate, are among the first fruits of which we find any particular notice in history. The cultivation of the apple, the pear, and some others, is also unquestionably of very great antiquity. Interesting particulars concerning the most important kinds of fruit, will be found under their respective heads.

The cultivation of fruits is generally carried on in connection with that of culinary vegetables, flowers, and other objects of the gardener's care; and the fruit-garden is almost necessarily more or less combined with the kitchen-garden, &c. The term fruit-garden is generally used when the ground between fruit-trees is regularly tilled and made to produce other garden crops; the term Orchard (q. v.), when it is laid down in grass or cultivated for grain and other agricultural crops. The latter method is practicable only with some, and these the more hardy kinds of fruit-trees.

Fruit-trees, in the open air, are cultivated either as wall-trees, espalier-trees, or standards. The walls intended for fruit-trees are either of brick or stone, the former, however, being preferable, and are generally from ten to fourteen feet high. Walls serve not only for protection from winds, but for the radiation of heat, and thus counterbalance in part the disadvantages of cold climates. The training of wall-trees will be noticed in a separate article. See WALL-TREES. Espaliers (q. v.) serve in an inferior degree the purposes of walls. Walls are sometimes flued and artificially heated, by which means early ripening is secured, and varieties of fruit are produced which could not otherwise in the same locality be grown in the open air. The production of fruits belonging to warm climates is also effected in the colder parts of the world by means of Hothouses (q. v.), in which the trees are generally trained either as wall-trees or on frames stretched almost horizontally, both methods being commonly adopted in the same hothouse. Standard trees, which receive no other training than mere pruning, or the occasional tying of a principal branch, to guide it in a particular direction, are further

distinguished according to the height of their stem before branching, as *full standards*, with stems six or seven feet high, more common in orchards where cattle are sometimes allowed to graze, than in gardens; *half-standards*, with stems three to five feet high; and *dwarf standards*, which, being otherwise also of small dimensions, and often bearing very fine fruit, and in great abundance, are particularly suitable for many situations, and for small gardens. The height of the stem is determined in the nursery, before grafting; but much depends upon the kind of tree; and all the varieties of some kinds may be permanently dwarfed by grafting on particular kinds of stock, as apple-trees by grafting on *paradise* stocks. Other means of still further dwarfing are practised as to trees intended for Forcing (q. v.), and to a remarkable extent by the Chinese in the cultivation of the Dwarfed Trees (q. v.), for which they are famous.

The soil of the fruit-garden requires particular attention. Different kinds of fruit-trees differ, indeed, as to the soils to which they are specially adapted, or in which they will succeed; but a rich and rather open soil is the most generally suitable. This soil must be of the depth of at least two feet, and it is better that it should be three or more; it must extend to a distance of at least eight or twelve feet from the trees, if they are not very dwarf. If the roots reach a bad subsoil, such as gravel or *till*, canker is almost sure to ensue. The care bestowed on the preparation of the soil for fruit-trees by the monks of the middle ages has seldom been equalled, and never exceeded in modern times. The whole soil of large gardens appears in some instances to have been artificially prepared; and the descent of the roots to an unfavourable subsoil was prevented by pavements. It is, of course, absolutely requisite that a fruit-garden be thoroughly drained. Manuring is sometimes unavoidable, but is apt, when injudiciously applied, to cause diseases in the trees; and when the soil requires to be enriched, road-scrapings, the scourings of ditches, rotten leaves, &c., are to be preferred. The use of guano and other artificial manures requires great caution. Where full crops of culinary vegetables are taken from the soil around the trees, there is less danger of injury from manures, although the practice, however necessary in many cases, is not the best either for the quality of the vegetables or the fruit.

The fruit-trees cultivated in Britain are almost always grafted or budded on seedling stocks either of the same or a nearly allied species. See GRAFTING. The raising and grafting of these stocks are generally carried on in the Nursery (q. v.). Some kinds of trees are propagated by layers or by suckers, and some by cuttings, the common method of propagating the varieties of gooseberries and currants. In warmer climates, these methods of propagation are more extensively used, and ungrafted seedlings are also more frequently allowed to become trees and to produce fruit. Concerning the transplanting of young fruit-trees, see TRANSPLANTING.—PRUNING will also be noticed in a separate article.—The methods of preserving the blossom from spring frosts being almost exclusively applicable to wall-trees, will be noticed under that head.

Besides fruit-trees, properly so called, some shrubs or bushes are much cultivated in Britain for the fruit which they produce, particularly the gooseberry, the red and white currant, and the black currant. Some of the fruits of tropical countries are in like manner produced by shrubs. The raspberry is only half-shrubby, the strawberry completely herbaceous; and these are the only half-shrubby or herbaceous plants much cultivated in the open air in Britain for their fruit. But in warmer climates, some of the most valuable fruits are produced by herbaceous plants, as the melon, cucumber, pumpkin, and all the kinds of gourds, the pine-apple, and, notwithstanding the tree-like size of the plants, the plantain and banana.

FRUIT-PIGEON (*Carpophaga*), a genus of *Columbidæ* (q. v.), having the bill considerably depressed at the base, compressed and moderately arched at the tip, the membrane in which the nostrils are pierced little prominent or swollen, the forehead low, and the feathers advancing on the soft part of the bill, the wings moderately long, the feet,

Fruit Pigeon (*Carpophaga Oceanica*).

and particularly the hinder claw, large, and formed for grasping. During the breeding-season, a curious gristly knob grows on the base of the upper mandible of some of the species, and soon after disappears. They are birds of splendid plumage, natives of the forests of India, the Indian Archipelago, the warmer parts of Australia, and the islands of the Pacific Ocean. Their food consists of fruits.

FRUITS, in Law. The fruits of the soil, in their legal aspects, fall under various categories, and follow different destinations according to their nature, and the situation in which they are placed. If not yet separated from the soil which produced them, they are said to be *pendentes*, and as parts of the soil (*partes soli*), pass to the heir on the death of the ancestor, or are carried by a sale to the purchaser. To this, however, there is an exception in the case of industrial fruits (*fructus industriales*), such as growing corn, and all those other fruits which require yearly seed and industry. These are called in England *emblements*, and 'though still in union with the soil, follow nevertheless, in several particulars, the nature of personal, as distinguished from real estate.'—Stephen's *Com.* ii. 227. The rule is the same in Scotland, but it is strictly construed, and does not include trees or planting, natural grass, or even fruit not yet plucked from the tree. To this again, however, there is an exception in horticultural subjects, in favour of nursery-trees and plants, not of larger or longer growth than such as are usually dealt in by nurserymen. See FIXTURES. Fruits that are separated from the soil (*fructus percepti*), on the other hand, are the property of the possessor who separated them in good faith; of the tenant or former proprietor in the case of a sale; and of the personal representatives of the deceased in case of death, and not of the heir of his real or heritable estate.

The act 7 and 8 Geo. IV. c. 30, 'for consolidating and amending the laws of England relative to malicious injuries to property,' applies to trees, saplings, shrubs, and underwood; to plants, fruits, and vegetable productions in gardens, orchards, nursery-grounds, hothouses, green-houses, or conservatories; and to various kinds of cultivated roots and plants not growing in a garden, orchard, or nursery-ground. The punishments are proportioned to the injury done, whipping in certain cases being added to the statutory punishments in the case of males, by 16 and 17 Vict. c. 99, and 20 and 21 Vict. c. 3. This statute (7 and 8 Geo. IV. c. 30) is limited to England, but there is an Irish statute in some respects corresponding to it (16 and 17 Vict. c. 38). In Scotland, the trees of an orchard fall under the act for preserving planting (1698, c. 16), and several still earlier enactments; and the breaking of orchards is an offence punishable by the sheriff (Ersk. i. 4, 4). See ORCHARD, PLANTATION. Injuries done to trees or other fruits of the soil are punishable at common law, independently of all statutory provisions, as malicious mischief, both in England and in Scotland.

FRUIT-TRADE. The trade in fruit is divided into two distinct branches—the *fresh* and the *dried* fruits. Fresh fruits, such as those which grow abundantly in England, are sold for London consumption almost entirely at Covent Garden Market; the sales at Spitalfields, the Borough, Portman, and other markets being comparatively small. There are many fruit-gardens within twenty miles of the metropolis which depend almost wholly on London consumption; but since the extensive spread of railway accommodation, fruit can now be brought up from distant parts of England with great facility; and provincial towns and the metropolis can alike be well supplied. Rapid conveyance and prompt sale and delivery are essential conditions to this kind of trade, owing to the tendency of the fruit to spoil by keeping. The higher the quality of the fruit, the more certain is the sale in London. There are in the island of Jersey pear-orchards, the produce of which is contracted for at very high prices by some of the Covent Garden dealers. The orange and lemon trades are managed in rather a peculiar manner; the produce is brought to England in very swift vessels, and is mostly consigned to fruit-merchants in the neighbourhood of Lower Thames Street, who sell it to the fruiterers and the street-dealers, as well as to the markets.

Dried fruit comprises raisins, currants, figs, and the like. Grown and dried in foreign countries, chiefly bordering on the Mediterranean, these kinds of fruit mostly arrive in cases and casks; and the dealings connected with them are conducted much in the same way as those with what is called colonial produce, such as grocery.

Of raisins, currants, oranges, and lemons, the quantity imported in 1858, 1859, and 1860 was as follows:

	1858.	1859.	1860.	
Raisins, . . .	160,484	337,133	206,647	Cwts.
Currants, .	182,940	225,056	306,274	Cwts.
Oranges and Lemons,	72,781	156,381	184,374	Bushels.

We present the numbers for these three years to shew how greatly the crops of these fruits vary in different seasons. Of other kinds of fruit, the official tables present the following quantities, in round numbers, imported in 1859—Almonds, 34,744 cwts.; apples, 385,046 bushels; figs, 46,040 cwts.; grapes, 19,557 bushels; chestnuts, 57,048 bushels; cocoa-nuts, 2,484,423 no.; hazel-nuts, 220,386 bushels; walnuts, 68,363 bushels; pears, 61,055 bushels; plums (French), 8702 cwts.; prunes, 16,030 cwts.; tamarinds, 634,697 lbs.

Some years ago, statistical papers in the *Morning Chronicle* gave returns concerning the quantity of fruit sold in Covent Garden and other London markets annually, estimated in the usual way by bushels, cwts., pottles, &c. About the same period, Mr Braithwaite Poole, goods-manager on the London and North-western Railway, gave tables of the amount, estimated in tons, of the fruit brought to London generally. The sources of information are not very clearly stated in either case; and as the two accounts are inconsistent one with another, they need not be given here.

FRUME'NTIUS, ST, apostle of Ethiopia and the Abyssinians, born in Phœnicia towards the beginning of the 4th century. At a very early age, he and another youth, named Œdesius, accompanied their uncle Meropius, a Greek philosopher from Tyre, on a voyage undertaken for mercantile, or, according to others, for scientific purposes. On their return, they landed on the coast of Abyssinia or Ethiopia, to procure fresh water; but the savage inhabitants, under the pretext of their hostility with the Romans, made an onslaught upon them, and murdered Meropius and the whole crew, sparing only the two boys, whom they found sitting under a tree and reading. They were taken as slaves into the service of the king; and made themselves so beloved that Œdesius was soon raised to the office of cupbearer, while the more sagacious F. became the king's private secretary and accountant. After the death of the monarch, F. was appointed instructor to the young Prince Aizanes, and in this capacity he obtained a still greater influence on the administration of the state affairs. He aided the Christian merchants who sought these parts, in founding a church, and gradually paved the way for the formal introduction of the new creed. In 326, he went to Alexandria—Œdesius having returned to Tyre, where he was made presbyter—and convinced Athanasius, who had recently been nominated Bishop of Alexandria, of the necessity of appointing a special ecclesiastical dignitary for Abyssinia, who should carry out vigorously the work of conversion. Athanasius, in full synod, and with its unanimous approbation, consecrated F. himself Bishop of Axum (Auxuma). The new bishop repaired to Abyssinia, and succeeded in proselytising large numbers. He is also supposed to have translated the Bible into Ethiopian. See ETHIOPIA. On his subsequent theological disputations with Theophilus the Arian—F. himself being in all probability an Athanasian—we cannot enlarge here. F. died about 360, and his day is celebrated by the Latins on the 27th of October, by the Greeks on the 30th of November, and by the Abyssinians on the 18th of December.—Socrates, i. 15; Rufin, *Hist. Eccl.* i. 9; Theodoret, i. 22; Ludolf, *Hist. Æth.* iii. 7, 17, &c.

FRUSTUM, in Geometry, is the part of a solid next the base, left on cutting off the top by a plane parallel to the base. The frustum of a sphere or spheroid, however, is any part of these solids comprised between two circular sections; and the *middle* frustum of a sphere is that whose ends are equal circles, having the centre of the sphere in the middle of it, and equally distant from both ends.

FRY, ELIZABETH, an eminent female philanthropist and preacher of the Society of Friends third daughter of John Gurney, Esq. of Earlham Hall, near Norwich, was born May 21, 1780. Her active and untiring exertions in the cause of suffering humanity, unparalleled in one of her own sex, acquired for her in her lifetime the name of 'the female Howard.' When not more than eighteen years of age, she established a school for eighty poor

children in her father's house, with his entire sanction. In 1800, at the age of twenty, she married Joseph Fry, Esq., of Upton, Essex, then engaged in business in London, to whom she had a family of eight children. In the year 1813, the deplorable condition of the female prisoners in Newgate attracted her attention, and she resolved upon visiting them. Alone and unprotected, she entered the part of the prison where 160 of the most disorderly were immured, and addressed them with a dignity, power, and gentleness which at once fixed their attention. She then read and expounded a portion of Scripture, many of those unhappy beings having on that occasion heard the word of God for the first time. It was not, however, till about Christmas 1816 that she commenced her systematic visits to Newgate, being then particularly induced thereto by the reports of the gentlemen who, in 1815, originated the 'Society for the Improvement of Prison Discipline.' She instituted a school within the prison walls, provided work for the females, and the means of Christian instruction, and established a committee of ladies for the reformation of female prisoners. The almost immediate result was order, sobriety, and neatness, in the place of the riot, licentiousness, idleness, and filth, which had previously prevailed. In 1818, her exertions were directed to making provision for the benefit of female convicts sentenced to transportation. For the relief of females in foreign prisons, she made frequent continental journeys. She also interested herself in the abolition of slavery, the advancement of education, and the distribution of Bibles and tracts. Her labours for the improvement of British seamen, by furnishing the ships of the Coast Guard and the Royal Navy with libraries of religious and instructive books, received the sanction and assistance of government. To the poor and helpless, her charities were unbounded. As a preacher among her own sect, she was held in high estimation; and she often engaged in gospel missions, not only throughout England, Scotland, and Ireland, but to various countries on the continent. She died at Ramsgate, October 12, 1845, aged sixty-five. Soon after her death, a public meeting was held in London, the lord mayor in the chair, for establishing, as the best monument to her memory, 'The Elizabeth Fry Refuge,' for affording temporary food and shelter to destitute females, on their discharge from metropolitan prisons. Compare *Memoirs of the Life of Elizabeth Fry*, 2 vols. (Lond. 1847), published by her daughters.

FRYING. See FOOD AND DRINK.

FRYXELL, ANDERS, a Swedish historian, was born in 1795 at Hesselskog, in Dalsland; studied at Upsala; took priest's orders in 1820; and in 1828, became rector of St Mary's School, Stockholm. F. first acquired a reputation by his *Berättelser ur Svenska Historien* (Narratives from Swedish History, vols. i.—xviii., Stockh. 1832–1852). These narratives, strung together on something of the same plan as Sir Walter Scott's *Tales of a Grandfather*, are marked not only by their patriotic sentiment, but by their fresh and natural conception, their richness of biographic detail, their naive and vivacious execution, and soon obtained a wide popularity in Sweden. The first volumes of this truly national work have been repeatedly published, and have been translated into almost all European languages; for example, into English by Schoultz (2 vols., Lond. 1844), and into German by Homberg (2 vols., Stockh. 1843). The part devoted to the history of Gustavus Adolphus has also been translated into German by Homberg (2 vols., Leip. 1842–1843), into French by Mlle. N. du Puget (Paris, 1839), and into Dutch by Radijs (Utrecht, 1844); and that devoted to the history of Gustavus Vasa into German by Ekendahl (1831). F.'s *Characteristics of the Period from* 1592 *to* 1600 *in Sweden* obtained a prize offered by the Swedish Academy. Another work, entitled *Om Aristokrat-fördömandet i Svenska Historien* (4 vols. Upsala, 1845—1850), in which he endeavours to clear the Swedish aristocracy from the accusations urged against them by Geijer and others, involved him in a keen controversy with the democratic liberal party in Sweden. F. has also addicted himself to poetry and music; and a opera of his, called *Wermland's Flickan* (or 'The Lass of Wermland'), has proved very attractive to his countrymen, on account of its fine national melodies.

FUAD-MEHMED, Pasha, a Turkish statesman and litterateur, was born at Constantinople in 1814. He is the son of the celebrated poet, Izzet-Effendi-Kitchegizadé, better known under the name of Izzet-Mollah, and nephew of Leïla Khatun, one of the very few Turkish poetesses. Having received an education more literary than that of the majority of young men destined for public affairs in Turkey, he began to make himself known as an author, when the exile of his father, who had fallen into disgrace with the Sultan Mahmud, and the confiscation of the paternal property, compelled him to choose a profession. He betook himself to medicine, and studied at Galata-Sérai from 1828 to 1832. In 1834 he was appointed Admiralty physician, and accompanied the grand admiral in his expedition against Tripoli; but on his return to Constantinople, he abruptly forsook medicine, and entered the more unquiet arena of politics. For several years, he employed himself in the study of diplomacy, history, modern languages, the rights of nations, and political economy. In 1840, he became first secretary to the Turkish embassy at London, where his skill and sagacity first made themselves conspicuous. In 1843 he was named second dragoman of the Sublime Porte, and shortly after was chosen to proceed to Spain to felicitate the queen of that country on her accession to the throne. F. was very popular at the court of Madrid. It was almost impossible to believe him to be a Turk. He spoke French marvellously well, made *bon-mots* like Talleyrand, and shewed himself as gallant as an Abencerrage. Curiously enough, although a *Mohammedan*, he obtained, while in Spain, among other honours, the Grand Cord of Isabella the *Catholic*. Here also he composed a poem on the Alhambra, which Turkish critics praise highly for its novel and interesting reflections. On his return to Constantinople, he was appointed to discharge the functions of grand interpreter to the Porte, which brought him into contact with the Duke of Montpensier, who arrived at Constantinople in 1845, and who, on his return to France, invested him with the cross of Commander of the Legion of Honour. In 1850 he went on a mission to St Petersburg, and in 1853 on another to Egypt. On his return from the first of these, he became minister of foreign affairs under the grand viziership of Aali Pasha (August 1852). On the question of the 'Holy Places,' F., by his attitude, and by a brochure very hostile to the pretensions of Russia, entitled *La Vérité sur la Question des Lieux Saints*, gave great dissatisfaction to the czar. In 1854, F. went to Epirus along with Omar Pasha, acting sometimes as a diplomatist and sometimes as a general. In the following year he received the title of Pasha, and was again appointed minister of foreign affairs, an office which he has since held, except for a short interval in 1857. To him especially, it is said, Turkey owes the hatti-sherif of 1856, ordering the

consolidation of the external defences of the Porte and the institution of telegraphs and light-houses.

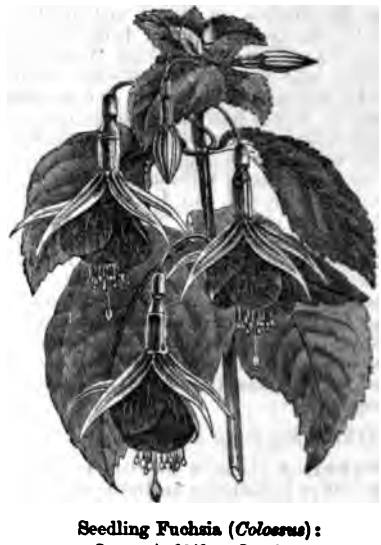
When the Turkish Academy of Science and Belles-Lettres was established in 1851, F. was one of the first members, and in the following year he published a *Turkish Grammar*, which is highly esteemed by native scholars. He has been loaded with distinctions by European sovereigns.

FUCA, STRAIT OF, a passage separating Washington Territory in the United States from Vancouver's Island, and connecting the Pacific Ocean with the Gulf of Georgia, has its outer or western entrance in lat. 48° 10′ N., and long. 124° W. It contains several islands, one of which, San Juan, became, in 1859, the subject of a dispute between Great Britain and the United States; the question being, whether it was to be regarded as an appendage of Washington Territory or British Columbia. This strait has also been prominent in the history of discovery; its first explorer, from whom it takes its name, having professed to believe, that, in traversing the entire length of the Gulf of Georgia, he had crossed from the Pacific to the Atlantic.

FUCA'CEÆ, according to Lindley, a natural order of Acotyledonous plants; but more generally regarded by botanists as a sub-order of *Algæ*. The species are numerous, about 500 being known, mostly growing in salt water. They are distinguished from the other algæ by their organs of reproduction, which consist of spores and antheridia, contained in common chambers or conceptacles, which are united in club-shaped receptacles at the end or margins of the fronds. The antheridia contain phytozoa. The frond is sometimes a stalk expanding into a broad blade, and sometimes exhibits no such expansion, and is either simple or variously branched. Many of the F. are provided with vesicles containing air, by the aid of which they are enabled to float in the water. Some attain a great size—*Macrocystis pyrifera* is said to have fronds of 500 to 1500 feet in length; its stem not being thicker than the finger, and the upper branches as slender as pack-thread. Most of the F. contain iodine in very considerable quantity, and some of them are therefore much used for the manufacture of KELP (q. v.), particularly different species of *Fucus*, or Wrack, and *Laminaria*, or Tangle. On account of the soda which they contain, they are also valuable as a manure. Some of them are eatable, containing large quantities of gelatinous matter, as the DULSE (q. v.), TANGLE (q. v.), and BADDERLOCKS (q. v.) of the British coasts, and certain species of *Sargassum* in other parts of the world. The medicinal uses of some of them seem to depend upon the iodine which they contain, and which it is now considered preferable to exhibit in other forms, after it has been extracted.

FU-CHOW-FOO (Happy City), a city and port of China, and capital of the province of Fuhkeen. It is beautifully situated on the left bank of the Min, 25 miles distant from the mouth of that river, in lat. 26° 3′ N., long. about 119° 50′ E., and was opened to foreign commerce by the treaty of 1842. The walls of the city are about 30 feet in height, and 8 miles in circumference, and have seven gates, the gateways of which are constructed of bricks, resting on a foundation of granite. The most important public buildings are the vice-regal palace and government yamuns, the temples of Confucius, of the god of war, and of the goddess of mercy. The beautiful bridge of 200 arches over the river Min is 12 feet wide, and about 12,000 feet long. Both sides are crowded with stalls, which narrow the bridge-path to 8 feet. A Buddhist monastery has been converted into the British consulate, which overlooks the town from a height of several hundred feet. The sturdy peasant-women of F., who are neat in their dress, and healthy in appearance, do most of the carrying work, and leave their feet as nature made them. The lacquered ware of F. is said to be of special excellence. It sends us tea to the extent of fifty millions of pounds annually; but timber comprises 9-11ths of the export trade. The population of the city has been estimated at 500,000.

FU'CHSIA, a genus of plants of the natural order *Onagraceæ*, containing a large number of species, natives of South America and of the southern parts of North America. They are half-shrubby plants, shrubs, sometimes climbers, and small trees, and have generally pendulous red flowers; of which the calyx is funnel-shaped, 4-cleft, finely coloured; the corolla 4-petaled: the fruit is a 4-celled berry; the leaves are opposite; the flower-stalks 1-flowered, springing from the axils of the leaves, or sometimes forming racemes at the top of the branches. Some of the species, as *F. coccinea*, *F. gracilis*, *F. globosa*, *F. fulgens*, *F. macrostemon*, *F. longiflora*, are much cultivated in gardens and greenhouses for the beauty of their flowers. Most of the species are too delicate for the climate, at least of the northern parts of Britain; but some of them, although killed to the ground every winter by frost, spring again from the root, and flower beautifully in autumn. A little protection around the root is of great use in



Seedling Fuchsia (*Colossus*):
Grown, in 1843, at Bagshot.

preserving them in vigour. All of them are propagated with extreme facility by cuttings, which has no doubt contributed to their present abundance, even in the gardens and windows of the poor. No flowering shrubs of recent introduction into Britain have become nearly so popular as those of this genus; and new varieties and hybrids have been produced in vast numbers, of which those with white flowers are particularly prized. The berries of a number of the species are eaten in South America, and preserved with sugar; and they are occasionally used in both these ways in Britain, although in Scotland the fruit even of the most hardy ripens only in favourable situations, for the most part on the west coast. Where the climate admits of it, a F. hedge is extremely ornamental

The wood of some species is employed in their native regions for dyeing black. The genus is named in honour of Leonhard Fuchs, one of the fathers of modern botany, born in Swabia in 1501, died at Tübingen, where he was a professor, in 1565.

FUCHS'S SOLUBLE GLASS is a peculiar silicate, which is prepared by melting together 8 parts of carbonate of soda, or 10 parts of carbonate of potash, with 15 of pure quartz sand, and 1 part of charcoal, which is added to facilitate the decomposition of the alkaline carbonate. A black glass is thus obtained, which is not soluble in cold water, but dissolves in about six times its weight of boiling water. Fuchs commenced his experiments on this subject in 1825, and has continued and varied them ever since. The above is, however, we believe, the most approved formula. The practical uses of the soluble glass to which he especially directed his attention were two—viz. (1), as a varnish, which, applied in the fluid form to stone surfaces, would harden into a glass, and prevent the ordinary effects of atmospheric influences; and (2) as a means of fixing fresco-colours by the process known as stereochromy. At the request of the late Prince Consort, Dr Fuchs gave a summary of all that he had done in this department in a paper which he read before the Society of Arts in 1859. See FRESCO.

It may be mentioned that Professor Kuhlmann of Lille has been long working at the same subject; and in 1857, published his method of producing a stone-protecting silicate; and that our own countryman, Mr Ransome of Ipswich, has not only employed concentrated solutions of silicate of potash, or of soda, as a cement for consolidating silicious sand into a very hard, durable, artificial sandstone, capable, before it is fired, of being moulded into any desired form, but has likewise produced a vitreous varnish, consisting of silicate of potash, after which he applies a coating of a solution of chloride of calcium: a silicate of lime is thus formed, which is stated to be very successful in protecting the surface of stone from external influence. Wood that has been painted with these varieties of soluble glass is rendered nearly if not quite fire-proof.

FUCI'NO. LAKE OF, or LAGO DI COLANO (ancient *Fucinus Lacus*), a lake of Naples, in the province of Abruzzo Ultra II., remarkable as the only one of any extent found in the Central Apennines. It is indeed the largest lake in Central Italy, being 10 miles long by 7 broad; and is situated at an elevation of 2176 feet above the sea-level. It is subject to sudden risings; and in ancient times, by order of the Emperor Claudius, a magnificent subterranean channel more than three miles in length, to carry off the surplus waters, was cut partly through the solid rock of Monte Salviano, rising 1000 feet above. This tunnel became obstructed in the middle ages, and has since remained so, notwithstanding many attempts to clear it. The consequence is, that in recent times the surrounding country has been often submerged. In 1855, operations were commenced by a Neapolitan company for the drainage of the lake. The principal stream it receives is the Giovenco.

FUCUS. See FUCACEÆ and WRACK.

FUEL. This term is generally applied to combustibles used for the production of heat; also, less frequently, to combustibles such as oil, Paraffine Oil (q. v.), used for lighting. Under articles COAL, COKE, &c., will be found details of the physical properties and chemical composition of the various fuels; the following observations bear chiefly on their economical application as sources of motive power.

The two elementary bodies to which we owe the heating powers of all our fuels, natural and artificial, are carbon and hydrogen. Coke, wood charcoal, peat charcoal, and anthracite, contain little or none of the latter element, and may be regarded as purely carbonaceous fuels. But wood, peat, and most varieties of coal, contain hydrogen as well as carbon; and in their combustion, these two substances combine to produce volatile and combustible hydrocarbons, which are volatilised previous to being consumed, while a purely carbonaceous fuel evolves no volatile matter until combustion has been effected.

These hydrocarbons are numerous and varied in composition (see CARBOHYDROGENS); but when combustion is perfect, the amount of heat produced by any hydrocarbon is exactly what would have been produced had the hydrogen and carbon been burned separately. It will be of advantage, therefore, to study these two elementary combustibles in succession, in order to estimate subsequently the combined effect where they come together in the same fuel.

The heating power of a combustible, or the *amount* of heat generated by it, is usually expressed in degrees Fahrenheit on so many pounds' weight of water. But in estimating the *temperature*, or intensity of heat produced, we have to keep in view that different substances have different capacities for heat—that of water being generally assumed as unity. The number expressing this capacity is called the specific heat of the substance. Water 1000, carbonic acid 221, imply that while 1000 units of heat are required to elevate the temperature of water any given number of degrees, only 221 units are required to elevate to the same temperature an equal weight of carbonic acid.

CARBON AS FUEL.—1. *Amount of air required for combustion.*—Burned in air, carbon combines with the oxygen to form carbonic acid (CO_2), mingled with nitrogen, the other atmospheric element. The chemical change may be thus represented, atomically:

				Products of Combustion.	
Carbon,		6·0			
Air 29·6	Oxygen,	16·0	→	Carbonic acid,	22·0
	Nitrogen,	53·6		Nitrogen,	53·6
		75·6			75·6

Or, assuming carbon as unity:

Carbon,		1·000			
Air 11·6	Oxygen,	2·667	→	Carbonic acid,	3·667
	Nitrogen,	8·933		Nitrogen,	8·933
		12·600			12·600

Carbon, therefore, requires about twelve times its own weight of air for perfect combustion.

2. *Amount of Heat produced.*—Andrews found that 1 lb. carbon produced heat equal to 1° F. in 14,220 lbs. of water. Other observations agree very closely. This may be otherwise stated thus: 1 lb. carbon will raise from freezing to boiling point (32° to 212° = 180°) $\frac{14220}{180}$ = 79 lbs. water; from mean temperature to boiling-point (60° to 212° = 152°) $\frac{14220}{152}$ = 93·5 lbs. water; will boil off in steam from mean temperature (60° to 212° = 152°, add latent heat in steam, 965° = 1117°), $\frac{14220}{1117}$ = 12·73 lbs. water; and will boil off in steam from boiling-point (latent heat in steam, 965°) $\frac{14220}{965}$ = 14·74 lbs.

3. *Utmost Temperature or Intensity of Heat from Carbon.*—Here we suppose the combustion effected in a space enclosed by non-conducting material, so that all the heat produced by 1 lb. carbon is

retained by the products of its combustion. Caloric sufficient to raise 14,220 lbs. water 1 F. is thus compressed, as it were, into 12·6 lbs. of carbonic acid and nitrogen. To determine the temperature thus produced, we require to know the specific heat of this gaseous compound, that of water being 1.

3·667 lbs.	carbonic acid.	Specific heat, ·2210
8·933 "	nitrogen.	" " ·2754
12·600 "	products of combustion.	Mean sp. " ·2596

14,220° on water at 1·000 specific heat, will give 54,776° on these products per pound-weight. Distributed over 12·6 lbs., this heat will raise the temperature to $\frac{54776}{12\cdot6} = 4347°$ F., which is therefore the utmost intensity of heat attainable in burning carbon, supposing no loss by absorption or radiation.

4. *Effect of Excess of Air.*—Excess of air has been proved to have no effect on the *quantity* of heat produced where combustion is perfect; but the intensity of *temperature* is diminished. Suppose two equivalents of air admitted; we then have as the products of combustion—

3·667 lbs.	carbonic acid.	Specific heat, ·2210
8·933 "	nitrogen.	" " ·2754
11·600 "	air in excess.	" " ·2669
24·200 "	products.	Mean sp. " ·2631

14,220° on water = 54,048° on this new mixture of gases. But the heat is now diffused over 24·2 lbs. matter instead of 12·6 lbs., $\frac{54048}{24\cdot2} = 2347°$ F.: the utmost temperature produced by carbon burned in two equivalents of air.

The utmost temperatures attainable, with various proportions of air, are given below, and also the appearance which the interior of the furnace would exhibit. Flame at these temperatures will present the same differences in colour.

Weight.		Ratio of Fuel to Air.	Highest Possible Temperature.	Appearance of a Body exposed to such Temperature.
Carbon.	Air.			
lbs.	lbs.			
1·	11·6	1 to 1	4347°	Intensely brilliant.
1·	17·4	1 " 1½	2951	Dazzling white.
1·	23·2	1 " 2	2233	Bright ignition.
1·	29·0	1 " 2½	1797	Full cherry red.
1·	34·8	1 " 3	1503	Commencing cherry red.
1·	58·	1 " 5	968	Incipient red.
1·	69·6	1 " 6	758	Black.

5. *Effect of Deficiency of Air.*—If, before reaching the upper layers of carbon or cinder, the air has parted with all its oxygen to form carbonic acid with the production of heat, then the carbonic acid combines with part of the remaining carbon to form Carbonic Oxide, CO (q. v.), but without producing heat. The loss may amount, therefore, to one-half of the fuel: some have stated it as high as three-fourths. If this oxide, when it gets above the fuel, meet with air before cooling, it burns with a pale blue flame, restoring part of the lost heat; but to what extent has not yet been determined.

6. *Effect of Water Present.*—Passing into vapour, water absorbs both sensible and latent heat, and thus diminishes the temperature. Heating power is also lost, as products of combustion are generally passed into the atmosphere at a high temperature.

HYDROGEN AS FUEL.—1. *Air required.*—Hydrogen combines with the oxygen of the air to form vapour of water, mingled with nitrogen:

				Products of Combustion.	
Hydrogen,		1·	→		
Air (34·8)	Oxygen,	8·	→	Vapour of water,	9·
	Nitrogen,	26·8	→	Nitrogen, .	26·8
		35·8			35·8

1 lb. hydrogen therefore requires 34·8 lbs. air, while 1 lb. carbon requires only 11·6 lbs.

2. *Amount of Heat Produced.*—The amount of heat produced from hydrogen is much greater than that from carbon; the caloric from 1 lb. heating 60,840 lbs. water 1° F. Part of this is, however, latent in the water-vapour, and must be deducted in calculating intensity of heat, and also heating effect under all ordinary circumstances. This deduction amounts to 9 lbs. water × 965° latent = 8685°, leaving 52,155° as the effective heating power of 1 lb. hydrogen.

3. *Utmost Temperature or Intensity of Heat.*—This is *less* than in the case of carbon, from the high specific heat and greater quantity of the products. We have—

Vapour of water,	9· lbs.	Specific heat, ·8470
Nitrogen, . .	26·8 "	" " ·2754
	35·8 "	Mean sp. " ·4191

52,155° on water will be 124,445° on these products; and $\frac{124445}{35\cdot8}$ lbs. = 3476°, is the utmost possible temperature.

4. *Effect of Excess of Air.*—As in the case of carbon, the intensity of heat is diminished, as under:

Weight.		Ratio of Fuel to Air.	Highest Possible Temperature.
Hydrogen.	Air.		
lbs.	lbs.		
1·	34·8	1 to 1	3476°
1·	69·6	1 " 2	2187
1·	104·4	1 " 3	1591
1·	139·2	1 " 4	1250

5. *Effect of Deficiency of Air.*—No new product is the result of deficiency of air, as in combustion of carbon; the hydrogen simply escapes unconsumed.

6. *Effect of water-vapour present* is diminution of intensity and ultimate loss of heat in application, as in the case of carbon.

Temperature of Ignition of Carbon and Hydrogen.—These substances must be themselves heated before they can burn. Hydrogen begins to burn at or below 300°, while carbon requires a red heat (800° to 1000° F.), and even at that temperature burns very slowly. Consequently, where they are combined, as in common coal, the temperature present is often sufficiently high to ignite and consume the hydrogen, while the carbon remains unchanged as cinder, or passes away as smoke, unconsumed in either case.

All that has been said above, of carbon, as to air required, heating power or value, utmost temperature, temperature of ignition, effect of water present, and of excess or deficiency of air, applies, without modification, to one class of fuels—the purely carbonaceous, including anthracite, coke from coal, charcoal from wood and peat, and the cinder of any description of fuel. The incombustible ash must be allowed for in calculating heating power or value; and also the volatile bodies—nitrogen, sulphur, &c.—the latter of which frequently renders the fuel unsuitable for many purposes in the arts and manufactures.

Peat, wood, and coal, with the exception of anthracite, contain hydrogen to an extent rarely exceeding 5 per cent. We have seen that, compared with carbon, hydrogen requires three times as much air, and generates nearly four times as much heat, but produces 20 per cent. less intensity of heat, and ignites at a much lower temperature; and the combustion of wood, coal, &c., is in these respects modified according to the proportion of hydrogen present in them.

The following table shews the composition of British coal, as determined by Playfair and De la Beche. Columns 8 to 12 are added to illustrate the process of combustion.

Locality.	Average Composition.					On Distillation, there is						Proportion of Hydrogen to Carbon.

When coal is heated in a retort, it yields volatile Hydrocarbons (q. v.), amounting to 20 to 32 per cent. of its weight (see column 11). The hydrogen has robbed the fuel of six times its own weight of carbon. When fresh fuel is added to live coal in a furnace, the same result ensues; so that in using coal, 50 to 67 per cent. of carbon burn on the grate, and 20 to 32 per cent. carbon and hydrogen have to be burned in the open space above the fuel, or escape unconsumed.

The elements of a hydrocarbon are consumed, not simultaneously, but in succession. First, the carbon is separated from the hydrogen in light floating particles, subsequently seen as soot or smoke (if not consumed); then the hydrogen burns, and communicates heat to the carbon particles, which then appear as flame. The colour of the flame indicates the temperature present; and if the temperature is sufficiently high, the carbon of which the flame is composed burns also, producing a further increase of heat. If not, the flame, as it moves onward, cools, becoming red, dull red, and finally black and smoky, passing away as such. For complete combustion of common coal, we therefore require not only air in sufficient quantity, but also intensity of heat above the fuel. We require a low temperature to separate the carbon from the hydrogen; a higher temperature to consume the hydrogen; and a still higher to consume the carbon of the flame. In closed furnaces, such as those of steam-boilers, while the current of air supplied continues pretty uniform in quantity, the volatile bodies are evolved almost immediately after fuelling; and would require, for the moment, perhaps four times the quantity of air which is passing through. The volatile fuel is, in consequence of the want of air, carried off partly unconsumed; and the temperature in such furnaces is frequently too low for the ignition of carbon, as may be seen from the colour of the flame; the cold boiler having abstracted the heat before the flame has been subjected to its influence. We refer to the article SMOKE, CONSUMPTION OF, for an account of the plans which have been adopted to secure perfect combustion, and thus prevent smoke. From the principles involved, we should expect most success where the fuel is supplied by mechanical arrangements as regularly and uniformly as the air, and where, in addition, the body of the furnace is protected or removed so far from boiler-surface and other cooling agents as is necessary to maintain a temperature within it sufficient for the thorough ignition of the flame. In house-fires, where the heat is lost if not radiated forward into the room, the cinders should be drawn to the front, and the fresh fuel laid into the vacant space behind. The gases rise between the two, and being highly heated, form a sheet of flame above and behind the red-hot fuel in front. If, as is commonly done, we throw the fresh fuel on the top of the live coal, we interrupt the process of radiation, and the gaseous part of the fuel is thrown off rapidly into the cool atmosphere above the grate, and does not take fire until a considerable period has elapsed. To our ordinary fire utensils, we might with advantage add one of a rake shape, suited for drawing forward the fuel.

For dimensions of furnaces, &c., see STEAM-ENGINE.

Economy of fuel will be best secured, first, by accomplishing perfect combustion both of the fixed and volatile parts of the fuel; and secondly, by regulating the amount of air, as any excess of this has to be passed on to the chimney at the same high temperature as the true products of combustion.

The abundance or scarcity of fuel has a great effect on the general interests of a country and the comfort of its inhabitants. The wealth and prosperity of Britain must be attributed in no small degree to the abundance of coal in those districts both of England and Scotland in which ironstone is most abundant, and in which, therefore, the coal is required as fuel for smelting it. But even for the most ordinary uses of domestic economy, the scarcity of fuel in some parts of the world causes much hardship to their inhabitants, whilst its abundance in others is one of their greatest natural advantages. Coal, wood, and peat are the three kinds of fuel principally used; coal being indeed the vegetation of former ages—or rather of former geological periods—the product of their sunshine and their showers, treasured up for the present; peat, a recent formation. Coal may be said in general to be of about twice the value of wood as fuel, weight for weight, in its heating power. In those parts of the world in which coal is not found, or to which it cannot be easily—or as yet profitably—conveyed, the preservation of forests is of great importance; and trees are not unfrequently planted, as in some parts of Europe, in hedgerows and otherwise, chiefly in order to provide a supply of fuel. For the same reason, pollarding is resorted to, the branches being used as fuel, and the trunk left to produce new branches. Only some kinds of trees are adapted to this mode of treatment. In some regions, as on some of the steppes of Asia and other treeless plains, the dried dung of herbivorous animals is much used as fuel. In cases of less extreme necessity, all kinds of vegetable refuse are used. Thus, in many parts of the continent of Europe, things are carefully gathered up for fuel which in any part of Britain would most probably be burned on the field, to get them out of the way. But it is not easy to compute the benefit derived by many parts even of Britain, particularly the

inland parts, from the recent great increase of the facilities of communication and of the trade in coal.

FUENTE DE OVEJUNA (The Sheep-well), a small walled town of Spain, in the province of Cordova, and 44 miles north-west of the town of that name, is situated on the crest and sides of a conical hill, between two of the upper branches of the Guadiata. At the foot of the hill, and on its western side, are the wells from which this town has derived its name. It has manufactures of linens, woollens, and leather. Coal-seams occur in the vicinity. Pop. about 5500.

FUE'NTES DE ONORO (The Fountains of Honour), a small village of Salamanca, Spain, on the Portuguese frontier, 14 miles west of Ciudad Rodrigo, is well known as the scene of one of the important battles of the Peninsular War, between the English under Wellington, and the French under Massena. Wellington, who had resolved to abide battle, drew up his forces between the Coa and the Agueda, his line extending north and south for about seven miles, and his right wing stretching two miles south of F. de Onoro. On the 3d May 1811, this village was fiercely attacked by a strong body of French troops, who forced the English from the streets, and were not dislodged until the English, reinforced by three regiments, drove them by a terrific charge from their position, with a loss in all of 300 men. On the 5th, the battle proper commenced. The French, much stronger than their enemies both in cavalry and infantry, assailed Wellington's right with overwhelming numbers, and although prodigies of valour were performed by the English—as in the case of Ramsey's brigade of horse-artillery, which cut its way through a solid body of cavalry—their right wing was turned, and their position lost. Never during the war were the English forces more perilously situated. Meanwhile, at F. de O., on which Wellington's *left* wing now rested, a fierce battle was being fought. The three English regiments who had been left in occupation made a desperate resistance against assailing multitudes. The fight lasted here till evening, reinforcements having been brought up on both sides; and the night closed upon the English holding the crags above the town, and the retiring regiments of the French. The loss of the allies amounted to 1500, while that of the French was stated at the time to be nearly 5000, and was certainly greater than that of the allies. Neither army could claim a decided advantage in this battle; but its result was, that on the 10th, the French were forced across the Portuguese frontier; and thus ended the French invasion of Portugal.

FU'ERO, a Spanish word derived from Lat. *forum*, signifies strictly, the seat of justice, jurisdiction. In this last sense, it was transferred to collections of laws, and specially to the civic rights granted by the kings to individual cities, the most famous of which were the fuero of Leon and that of Naxera. As these city charters contained for the most part special liberties, concessions, and privileges, the word fuero became current chiefly in this sense, and was particularly so applied to designate the body of privileges and liberties that made up the constitution of Navarre, and of the three Basque provinces of Biscaya, Alava, and Guipuzcoa. These are the fueros the maintenance of which gave rise to wars in the Basque provinces in 1833. The fueros of other provinces and cities of Spain have been long extinct.

These Basque fueros are grounded on the old laws of the Visigoths, and grew up in the period between the irruption of the Moors into the Spanish peninsula and the consolidation of the Spanish monarchy under the House of Hapsburg. The same was the case in the half-Basque province of Navarre, which formed an independent kingdom under its own sovereigns. The fueros are thus the product of the ancient Gothic laws—those fertile sources of modern rights—and the new circumstances in which they were placed. They resulted by degrees, here as elsewhere, in a struggle between the people and the princes; and their development forms an interesting chapter in the history of modern constitutionalism. They were at first only privileges and statutory rights granted to single places, and from these were extended to others. By the introduction of the representative element of the Cortes, and extension over whole provinces, they were then transformed, in virtue of the general law of custom, into constitutional rights of these provinces; and were in time collected and formally embodied and sanctioned as such. It was in this way that the fueros of Navarre, which had been growing into consistency for centuries previously, were, in 1236, during the contests between King Theobald and his Cortes, collected and recorded, and remain yet under the title of *Cartulario del Rey Tibaldo*. Ferdinand the Catholic, who united Navarre with the crown of Castile, maintained the fueros, adapting them to the new relation to Castile. Their leading provisions are these: The Cortes, chosen for three years, and consisting of the three estates of clergy, nobles, and commons, are to meet yearly; and without their consent, no law can be passed, or anything of importance undertaken. The government consists of the viceroy, who presides in the Cortes and Great Council; the Great Council of Navarre (a body similar to the old French parliaments); and the Contaduria, before which all accounts of revenue and expenditure must be laid. There is no custom-house or toll but at the frontier, and except the trifling grant of 176,000 reals, nothing flows into the royal treasury. All these fueros the king must bind himself by a royal oath to maintain.

In the lordship (Señorio) of Biscaya, the fueros grew up in the contests of the inhabitants with their counts. They were first collected into a code by Count Juan in 1371, which, after the final union of Biscaya with Castile, was recast (1526), completed, and confirmed by King Charles I. (the German emperor Charles V.). According to this charter of rights, every new 'Lord'—for only so do the Biscayans style the king of Spain as their prince—fourteen years old, must come into the country within a year, and take the oath to uphold the fueros in certain places appointed for that purpose. The government consists of a corregidor, appointed by the 'Lord,' and two deputies; these, aided by six regidores, and forming the regimiento, conduct the administration. But the supreme power resides in the General Assembly (Junta General), which meets yearly under the tree at Guernica, and regulates all the affairs of the lordship, and appoints the deputies and regidores. Justice is administered, in the first instance, by the lieutenants (Tenentes) of the corregidor; in the second, by the corregidor and deputies; and in the third, by the royal court at Valladolid. Other privileges are, that every Biscayan of pure blood is counted noble; that except the post-office there is to be no royal governing board in the province; that Biscayans are not bound to serve in the Spanish army, nor to receive Spanish troops. The fueros of Alava and Guipuzcoa are of analogous origin and character, but differing in details. These fueros were almost entirely abolished by Espartero, but were restored by Queen Isabella in 1844. See SPAIN.

For the support they afforded him in his
on against Algiers in 1535, they received
the right of coining money. Antony F., at his death, left six millions gold crowns in ready money, besides jewels and possessions in all parts of Europe and in both Indies. It is of him that the Emperor Charles is said to have remarked while being shewn the royal treasury in Paris: 'There is a linen-weaver in Augsburg that could pay all that out of his own purse.'

The Emperor Ferdinand II. raised the splendour of the House of F. still higher while confirming the imperial letter of Charles, by conferring great additional privileges on the two oldest of the family, Counts John and Jerome. The Fuggers continued still as nobles to carry on their commerce, and further increased their immense wealth. They attained the highest posts in the empire, and several princely houses prided themselves on their alliance with the House of Fugger. They possessed the most extensive libraries and collections of objects of art, maintained painters and musicians, and liberally encouraged art and science. Their houses and gardens were master-pieces of the architecture and taste of the times. There is thus nothing incredible in the story that Antony F., on one occasion when Charles V. was his visitor, lighted a fire of cinnamon wood with the emperor's bond for money lent him.

While thus indulging in splendour, they were not less bent on doing good. Ulrich, George, and Jacob, the sons of the beneficent Jacob, bought houses in one of the suburbs of Augsburg, pulled them down, and built 108 smaller houses, which they let to poor citizens at a low rent. This was the origin of the 'Fuggerei,' which still remains under the same name, with its own walls and gates. Many other benevolent institutions were set on foot by Antony F. and his sons. It is questionable if we are to rank among their benefactions their calling the Jesuits to Augsburg, and giving them buildings and revenues for a college, church, and school. The race is still continued in the two principal lines of Raimund and Antony, besides collateral branches. The domains are chiefly in Bavaria. A collection of portraits of the most important members of this great house, executed by Domin. Custos of Antwerp, appeared at Augsburg (1593 et seq.). This collection (increased to 127, with genealogies written in Latin) was republished by the brothers Kilian (Augsburg 1618); and in 1754, a new edition of the work, still further improved, and containing 139 portraits, was published at Ulm, under the title *Pinacotheca Fuggerorum*.

FUGITATION. A sentence of fugitation in Scotland corresponds to outlawry in a criminal process in England, and is pronounced where a person fails to appear to answer to a criminal prosecution against him. Amongst other consequences, it entails the escheat of his whole movable property to the crown. See ESCHEAT.

FUGITIVE SLAVE LAW. Slaves being regarded as property, things and not persons, as the Roman law puts it, the existence in every state in which slavery exists of a law recognising the right of the master to reclaim his property follows as a logical consequence. Accordingly, the constitution of the United States of America having recognised slavery, or 'service,' as it is gently termed by American writers, necessarily contained a number of enactments for its enforcement. By art. 4, s. 2 of that document, it is declared that persons held to service or labour in one state, under the laws thereof, and escaping into another, shall be delivered up, on claim of the party to whom such service or labour may be due. In furtherance of this provision, the laws of New York have provided for the arrest of

such fugitives, on *habeas corpus*, founded on due proof, and for a certificate in favour of the right of the claimant, and delivery of the fugitive to him, to be removed. The existing law, as narrated in the latest edition of Kent, seems to be the following: The act of 1793, providing for the reclamation of fugitives from justice and from service, has, so far as relates to the latter, been amended, and to a considerable extent superseded by the act of September 18, 1850. The judicial duties imposed by the latter act are to be performed by the United States commissioners, who may have the power of arresting or imprisoning for offences against the United States, by the judges of the circuit and district courts of the United States, and of the superior courts of territories, and by such special commissioners as the respective courts may appoint. It is the duty of all United States marshals to obey and execute all warrants and process of such judges and commissioners; and after the arrest of any fugitives, such officers are liable for an escape with or without their assent. When any fugitive has escaped into another state or territory, the owner, or his duly authorised agent, may pursue and personally arrest said fugitive, or may demand a warrant and arrest from the officer having due authority. The fugitive is then to be taken before a commissioner or judge, whose duty it is to hear and determine the complaint in a summary manner. Should he be satisfied of the validity of the claim and the identity of the slave, it is his duty to deliver to the claimant a certificate of the proceeding had, with authority to remove the fugitive to the place from which he fled. The testimony of the fugitive is not admissible. Any assistance rendered to a fugitive to enable him to escape from the claimant, or any obstruction offered to his arrest, is penal, and also subjects the party to damages at the suit of the owner. All citizens of the United States are required, when called upon, to render the officers personal assistance in the performance of their duties. These provisions apply to all the states, or did so, at least, previously to the war, whether slavery was recognised by their special laws or not; the principle being, that 'the constitution and laws of the United States secure the right to reclaim fugitive slaves against state legislation.' In some of the slave-holding states, it is held, that if a slave from such a state go lawfully into a non-slave-holding state, and acquire a domicile there with his master, or is emancipated there by his master, he becomes emancipated, and ceases to be a slave on his return; but if he be carried there for a temporary purpose, and return, his state of slavery is resumed. These provisions have no influence on the condition of the fugitive slave (Kent, *ut sup.* ii. p. 297).

FU'GLEMAN, (properly, *Flugelman*, from the German *flügel*, a wing), an intelligent soldier posted in front of a line of men at drill, to give the time and an example of the motions in the manual and platoon exercises. He originally stood in front of the right wing, and hence the name.

FUGUE, in Music, is the name of a composition wherein the parts do not all begin at once, but follow or pursue one another at certain distances; thence the name, *Fuga*, a flight or chase, each part successively taking up the subject or melody. Any of the parts may begin the fugue, but the others follow according to fixed rules. The subject is generally a few bars of melody, which is given out in the principal key by the part which begins. The next part which enters repeats the same melody, but a fifth higher or a fourth lower, and is called the answer. The third part follows with the subject again in the principal key, but an octave higher or lower than the first part, and is answered by the fourth part in the same manner as the second part answers the first. After the subject is completed, the melody which follows it, so as to form a continuation of the part, is called the counterpoint, in the construction of which, facilities for ingenious double counterpoints of various kinds are afforded. When the subject and answer have been introduced in all the parts, the first section of the fugue is said to be completed; an intermediate harmony of a few bars then follows, sometimes in its form like part of the subject, and with a modulation into a nearly related key. The subject and answer are again brought forward, but following in a different order from the first section; while at the same time all the parts are continued, and in some of them the original counterpoint appears either simply or inverted, the subject and answer forming the predominating idea throughout the whole composition, and towards the end appearing in a variety of forms, intervals, and modifications. When the subject does not extend in compass beyond the half of an octave, the answer is invariably made in the other half; and to avoid modulation out of the key, the progression of a fifth is answered by a fourth. A fugue consisting of one subject with a counterpoint throughout, is called a strict fugue, as in the following example by J. Sebastian Bach, in which the first progression of a fifth is answered by a fourth:

When a second subject is introduced in the middle of the composition, and afterwards worked up with the first subject, it is then called a fugue on two subjects, as in the following from Graun's *Tod Jesu*

A double fugue begins at once with two subjects in different parts, both of which are strictly treated throughout, as in the following from Mozart's *Requiem:*

2d Subject.

Formosa and the Pang-hoo group are included in this province. Area, 53,480 square miles; pop. 22,699,440.

FÜHNEN (Dan., *Fyen*), the largest of the Danish islands after Seeland, is bounded on the W. by the Little Belt, which separates it from Jutland and Sleswig; on the N. by the Odensee Fjord; on the E. by the Great Belt; and on the S. by the Little Belt, and by the island of Langeland, which is incorporated with it in one circle, or *stift*, of the kingdom. The area of this province is about 1280 square miles, and the population nearly 200,000. The coast is generally rugged, and much indented with bays or fjords; but the interior is flat, except towards the south and west, where there is a range of hills rising to about 500 feet. The land, which is well watered by several small streams, is fruitful and well cultivated, producing abundant crops of cereals. Barley, oats, buckwheat, rye, flax, and hemp are grown in larger quantities than are required for home consumption. Honey is also largely exported. The F. horses are in great request, and large numbers of these animals, and of a fine breed of horned cattle, are annually sent out of the island. The province of F. is divided into the two bailiwicks of Odensee and Svendborg. The principal towns are Odensee (q. v.), Svendborg (q. v.), and Nyborg (pop. 3000), a fortified town on the east coast, and the most direct port of communication with Seeland, and memorable as having been the seat of the annual Danehof, or meeting of the States, instituted in 1354 by Valdemar IV., and for the victory gained in 1659 by the Danes and their allies over the Swedes.

FULAHS [properly, *Fúlbe* (sing. *Púllo*), called also Féllani (sing. Baféllanchi), Felláta, and Fullán], the name of a widely spread negro people in Upper Súdán, regarding whose origin there is much diversity of opinion. M. Eichwaldt (see *Journal de la Société Ethnologique*, 1841, vol. i. p. 2, et seq.) has endeavoured to connect them with the Malays in the far East, but, according to Dr Barth, 'none of his arguments are of any consequence.' Yet Dr Barth himself is of opinion that 'their origin is to be sought for in the direction of the East; but this,' he adds, 'refers to an age which for us is enveloped in impenetrable darkness.' The F. first emerge into the light of history about the beginning of the 14th c., when, as we learn from Ahmed Bábá's *History of Súdán*, two members of the tribe went on a religious mission from Melle, on the borders of Senegambia, to the king of Bórnu. The importance of this incident lies in the fact, that it shews that in the dawn of their history—as has invariably been the case in later times—the course of the tribe was from *west to east*, and also, that at the early period referred to, they were distinguished for that religious learning which still characterises them. After the 14th c., successive swarms of F. appear to have left the kingdom of Melle, or the mountainous region of Fuládu, and to have spread themselves over the greater portion of Súdán, 'absorbing and incorporating with themselves different and quite distinct national elements, which have given to their community a rather varying and undecided character.' Hence originate the conflicting accounts of travellers, some of whom speak of the F. as differing little from the negroes; others, as having their features and skulls cast in the European mould; while Bowen describes those of Yoruba as being some black, some almost white, and many of a mulatto colour, varying from dark to very bright. Many other tribes, which have not been quite absorbed by the F., are yet so far blended with them, that they have lost their native idiom altogether, and speak the language of the predominant race, which is termed the Fulfúlde. The F. are not all under one ruler; they are a *race*, not a *nation;* and have founded many kingdoms, such as those of Sókoto, Gando, Timbo, &c. The endless tribes belonging to their stock are generally divided into four groups or families, the Jel, the B'áñ, the Só, and the Berl. Most of them became converted to Mohammedanism about the middle of the 18th c., and in 1802, under the Imám Othman, commenced a religious war on the surrounding pagans, which terminated prosperously in the establishment of the great Fulah empire of Sókoto. Othman died in a sort of fanatical ecstasy or madness in 1818. The F. are industrious and inclined to trade; they work iron and silver, manufacture with great neatness articles in wood and leather, and weave various durable fabrics. They are by far the most intelligent of the inhabitants of Súdán, and have, besides mosques, schools in almost all their towns.

FU'LCRUM, in Mechanics, is the prop or fixed point on which a lever moves. See LEVER.

FULDA, a town of Germany, in the electorate of Hesse-Cassel, 54 miles south of Cassel, is pleasantly situated on a rising-ground on the right bank of the Fulda, a considerable stream, which, rising from the western base of the Rhöngebirge, in Bavaria, flows northward through Hesse-Cassel, and unites with the Werra on the Hanoverian border, after a course of 110 miles. It is a pretty town, surrounded by old walls, and has a market-place, two squares, and eight suburbs. One of the chief buildings is the cathedral, the fourth church that has been built on this site. It is a handsome modern structure, and covers the shrine in which the body of St Bonifacius was deposited after his murder by the Frisians in 754. The other notable structures are the palace, formerly the residence of the prince-bishops of F.; the church of St Michael, founded in 822; a gymnasium, schools of art and manufactures, and a public library. F. has acquired a reputation for its linen manufactures; it has also extensive establishments for the manufacture of vinegar and beer; with dye-works, tanneries, and weaving. Pop. 14,000, mostly Roman Catholics. The province of Fulda, of which F. is the capital, forms part of what was formerly the grand-duchy of Fulda. This territory was incorporated with the grand-duchy of Frankfurt by Napoleon in 1810, and ceded to Prussia in 1815, but immediately afterwards was made over to Hesse-Cassel.

FU'LGORA. See LANTERN-FLY.

FU'LGURITES (Lat., *fulgur*, lightning), tubes formed of vitrified sand, which are found in sand-banks, and in soils consisting chiefly of silicious sand, and are attributed to the action of lightning melting and vitrifying the sand. They were first discovered in 1711 by the pastor Herman, at Massel, in Silesia, and have since been found in many places; but their origin was first pointed out by Dr Hentzen in 1805. They are from a quarter of an inch to two inches and a half in diameter, their internal surface of a perfectly glassy substance, hard enough to scratch glass, and to give fire with steel. They are usually, but not always, placed vertically in the sand, become narrower downwards, and sometimes divide and subdivide into branches.—The effects of lightning seem to be exhibited also in some places on rocks by vitrification and the production of a sort of enamel, sometimes assuming the form of beads.

FULHAM, formerly a village, but now a suburb of London, in the south of Middlesex, on the left

bank of the Thames, six miles south-west of St Paul's.

FU'LICA. See Coot.

FULI'GULA. See Pochard.

FULLER, Andrew, an eminent Baptist minister, and theological and controversial writer, the son of a small farmer, was born at Wicken, Cambridgeshire, February 6, 1754. He received the rudiments of his education at the free school of Soham, and in his youth was principally engaged in agricultural labours. In his 17th year, he became a member of a Baptist church at Soham, and in 1775 he was chosen pastor of a congregation at that place. His small stipend of £21 per annum he endeavoured to increase by keeping, first a small shop, and then a school. In 1782, he removed to Kettering, Northamptonshire, to take the pastorate of a congregation there. On the formation, in 1792, of the Baptist Missionary Society by Dr Carey, himself, and eleven other ministers, he was appointed its secretary, and the whole of his future life was devoted to the administration of its affairs. In 1794 he published a controversial treatise, entitled *The Calvinistic and Socinian Systems, examined and compared as to their Moral Tendency* (Lond. 8vo). This work was attacked by Dr Toulmin and Mr Kentish, and F. replied in a pamphlet, entitled *Socinianism Indefensible* (Lond. 1797, 8vo). His other principal publications are *The Gospel its own Witness* (Clipstone, 1797), and *Expository Discourse on the Book of Genesis* (2 vols. 8vo, Lond. 1806). He was also the author of a variety of single sermons and pamphlets. The sense, sagacity, and thoroughly practical knowledge of mankind which these writings display, have won for F. the title of 'the Franklin of Theology.' He died May 7, 1815. Three collected editions of his works have been published, besides American reprints; the first in 10 vols. 8vo, the second in 5, and the third in 1 royal 8vo. A volume of his treatises was republished in Bohn's Standard Library, with a Memoir by his son. F.'s *Memoir of the Rev. Samuel Pearce of Birmingham* is much esteemed as a religious biography.

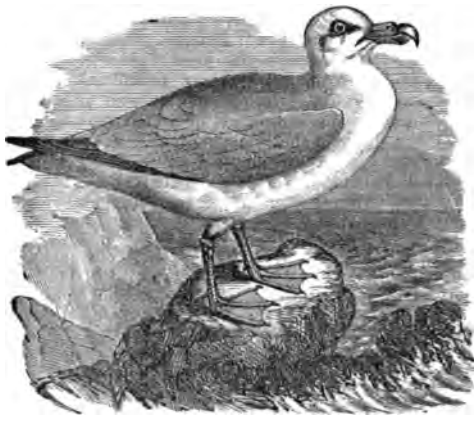
FULLER, Sarah Margaret, Marchioness Ossoli, an American lady, whose talents, rare individuality of character, and untimely death, give to her history a peculiar and tragic interest, was born at Cambridgeport, in Massachusetts, in 1810. Under the care of her father, a lawyer and member of Congress, she was early and thoroughly instructed in the classics. It is related that he used to say of her, while still a child, that she 'knew more Latin and Greek than half the professors.' At a very early age, she had also made great proficiency in French and Italian. After the death of her father in 1835, she became teacher of languages in Boston, and subsequently principal of a school at Providence, Rhode Island. In 1839, she published a translation of Eckermann's *Conversations with Goethe*. She became, in 1840, editor of the *Dial*, a periodical instituted for the advocacy and diffusion of Transcendentalism in America, and for which she wrote a number of admirable articles on literature and art. Her *critique* on Goethe especially, in the second volume of the *Dial*, has been greatly and deservedly praised. 'Nowhere,' says Mr Emerson, 'did Goethe find a braver, more intelligent, or more sympathetic reader.' Her *Summer on the Lakes*, a vivid and truthful picture of prairie-life, was published in 1843. Soon after, she took charge of the literary department of the *New York Tribune*. In 1846, she visited England, where she made the acquaintance of Carlyle and other eminent men. From London, she journeyed through France to Italy. At Rome, she accidentally became acquainted with the Marquis Ossoli, to whom, though many years younger than herself, she was married in December 1847. She took the deepest interest in the cause of Italian liberty; and during the siege of Rome, in 1849, devoted herself with untiring assiduity to the care of the sick and wounded. In May 1850, she and her husband set sail for America; but a violent storm having arisen when they were near the coast of the United States, the vessel struck on Fire Island Beach, Long Island, in the morning of the 16th of July, and a few hours after went to pieces. Among those who perished were the Marquis and Marchioness Ossoli and their child.

FULLER, Thomas, D.D., an eminent English historian and divine, was born in 1608 at Aldwinkle, Northamptonshire, of which parish his father was rector. He was educated at Queen's College, Cambridge, and greatly distinguished himself by his application to study. He took the degree of A.B. in 1624, and that of A.M. in 1628. He stood so high in the estimation of his college that, before he was 23 years of age, he was appointed to St Benets, Cambridge, and acquired great popularity as a preacher. Soon after, he was collated to a prebend in Salisbury Cathedral, and obtained a fellowship in Sidney Sussex College. His first publication was a poem, entitled *David's Heinous Sin, Hearty Repentance, and Heavy Punishments* (1631, 8vo). He was next presented to the rectory of Broad Windsor, Dorsetshire; published his *History of the Holy War* at Cambridge in 1639; and in 1640 removed to London, where he was chosen lecturer at the Savoy Church in the Strand. The same year, he was a member of the Convocation at Westminster, and one of the select committee appointed to draw up new canons for the better government of the church. During the civil war he adhered firmly to the royal cause; and shared in its reverses. In 1646, however, he was chosen lecturer, first, at St Clement's Lane, Lombard Street, and afterwards at St Bride's. About 1648, he was presented to the living of Waltham, in Essex. In 1650, he published a geographical account of the Holy Land, entitled *A Pisgah Sight of Palestine and the Confines thereof* (folio, with maps and views), and *Abel Redivivus*, a collection of lives of modern divines. In 1655, he published at London *The Church History of Britain, from the Birth of Jesus Christ until the year* 1648 (folio). In 1658, he received the living of Cranford, Middlesex, and at the Restoration he was reinstated in his prebend of Salisbury, of which he had been deprived by the Parliamentarians. He was also appointed chaplain extraordinary to the king, and created D.D. at Cambridge by royal mandamus. He died August 16, 1661. His principal work, *The Worthies of England*, was published at London in 1662 (folio). Valuable for the information it contains on provincial history, it abounds in biographical anecdote, witty remark, and acute observation on men and manners. A new edition, with his life prefixed, appeared in 1810 (2 vols. 4to). His *Holy and Profane States* were republished in America in 1831. Quaint humour is one of F.'s peculiar characteristics; but his writings are no less remarkable for wisdom, imagination, and, when occasion demands, even for pathos. 'Next to Shakspeare,' says Coleridge, 'I am not certain whether Thomas Fuller, beyond all other writers, does not excite in me the sense and emulation of the marvellous. . . . . He was incomparably the most sensible, the least prejudiced great man, in an age that boasted of a galaxy of great men.'

FULLER'S EARTH, a mineral consisting

chiefly of silica, alumina, and water, with a little magnesia, lime, and peroxide of iron. The silica is about 50, the alumina 20, and the water 24 per cent. of the whole. It is regarded as essentially a hydrous bisilicate of alumina. It occurs in beds, associated with chalk, oolite, &c.; is usually of a greenish-brown or a slate-blue colour, sometimes white; has an uneven earthy fracture, and a dull appearance; its specific gravity is from 1·8 to 2·2; it is soft enough to yield readily to the nail; is very greasy to the touch; scarcely adheres to the tongue; falls to pieces in water, but does not become plastic. It has a remarkable power of absorbing oil or grease; and was formerly very much used for fulling cloth (see WOOLLEN MANUFACTURE), for which purpose it was considered so valuable, that the exportation of it from England was prohibited under severe penalties; it is still used to a considerable extent. The annual consumption in England is said to have at one time exceeded 6000 tons. It is found at Nutfield, near Reigate, in Surrey, in cretaceous strata; where there are two distinct beds, the upper one of a greenish colour, and 5 feet thick, resting on the other, which has a bluish tint, and is 11 feet thick. It is also found in Bedfordshire, Nottinghamshire, and Kent; and on the continent in Saxony, Bohemia, and near Aix-la-Chapelle. There is a considerable deposit of it at Bath, where the group of associated blue and yellow clays and marl has received the name of 'the Fuller's Earth Series.' It is also found at Maxton, in Scotland.

FULMAR, or FULMAR PETREL (*Procellaria* or *Fulmarus*), a genus of birds generally referred to the gull family (*Laridæ*), and containing some of the most strictly oceanic birds. See PETREL. The bill is not longer than the head—large, strong, and subcylindrical; the upper mandible suddenly hooked at the point; the lower mandible with the tip curved upwards; the tips of both mandibles appearing as separate pieces firmly joined to the straight part of the bill, which is marked by longitudinal grooves; the nostrils enclosed in a tube open at the extremity, and extending along the ridge of the upper mandible. The tarsi are compressed; the hind-toe rudimentary, a mere claw.



Northern Fulmar (*Procellaria glacialis*).

The tail is short, and slightly rounded; the wings are long.—The COMMON or NORTHERN F. (*P.* or *F. glacialis*) is a bird about the size of a duck, gray above, white beneath, the head and neck pure white, the tail white, the bill yellow; the young brownish gray. It inhabits the most northern seas, in which its numbers are prodigious; breeds on the rocky shores of the Farŏe Islands, Iceland, Greenland, Spitzbergen, &c., on the grassy shelves of the precipices, making a slight nest or a mere excavation, in which it lays one egg. It is rarely to be seen on the southern coasts of Britain, but more frequently in Orkney and Shetland, where, however, it is said never to breed, although it breeds in great numbers in St Kilda and the adjacent islets of Borrera and Soa. It frequents these isles in vast numbers, and is of great importance to the inhabitants of St Kilda, who esteem its eggs above those of any other bird, and seek them in the most perilous manner, descending by ropes from the summit of the precipices. The fulmars are also valued for their feathers, for their down, and for their oil, which is one of the principal products of St Kilda, and is obtained from their stomachs. The old are said to feed the young with it; and when they are caught or assailed, generally lighten themselves by disgorging it. It is amber-coloured, and has a peculiar and very disagreeable odour. Fulmars feed on all animal substances which come in their way, giving an evident preference to fat, and delighting in the blubber of whales. They pursue whales to prey on the cirrhopods which are attached to them, or imbedded in their skin. Multitudes of them soon gather around a dead whale, and they are so bold as to advance within a few yards of the men who are cutting it up. When food is abundant, they often glut themselves till they are unable to fly. They follow the greasy track of a whaler, and, indeed, some of them are always in attendance on ships immediately after they pass north of the Shetland Islands, ready to seize any garbage that may be thrown overboard. Sailor-boys often amuse themselves in catching them by means of lines and hooks baited with fat.

Another species of F. (*P.* or *F. Pacifica*) exists in the Pacific Ocean, and the MOTHER CAREY'S GOOSE of sailors, a large bird of the southern seas, is sometimes referred to the same genus.

FULMINATE OF MERCURY, or FULMINATING MERCURY ($2HgO,C_4N_2O_2$), is best prepared by dissolving 3 parts of mercury in 36 of nitric acid of specific gravity 1·34, without the application of heat, in a flask capable of holding 18 times the bulk of the acid. The solution is then to be poured into a large vessel containing 17 parts of alcohol of specific gravity 0·830, and immediately to be re-transferred to the flask, which is still full of nitrous vapours, and with which it must be well shaken, in order to effect their absorption. Effervescence commences in a few minutes, and soon becomes extremely violent; and at the same time there is a deposit of metallic mercury, which is gradually re-dissolved. The reaction must be moderated by the gradual addition of 17 parts more of alcohol; and on cooling, crystals of the fulminate, amounting to 4·6 parts, are deposited. These must be washed with cold water, and dried at 100° F. Fulminate of mercury forms white silky needles. It may be handled without much danger when moist; but when dry, it explodes with violence when struck by a hard body, or when touched with nitric or strong sulphuric acid. A mixture of 1 part of this salt with 6 parts of nitre, or of 3 parts of the fulminate, 5 of chlorate of potash, 1 of sulphur, and 1 of ground glass, is employed as the priming of percussion-caps. It is applied as a dry powder, and is made to adhere to the cap by the application of a drop of shell-lac varnish.

FULMINATE OF SILVER, or FULMINATING SILVER ($2AgO,C_4N_2O_2$), is prepared in nearly the same manner as the fulminate of mercury.

re powerfully explosive than the last-named iven when moist or under water, pressure hard body will cause its explosion; and uite dry, the slightest friction between two dies produces a similar result.
preparation of the fulminates is attended ery considerable danger, and should be ed by none but professed chemists.

MI'NIC ACID has never been isolated in lrated form, but from the composition of its s formula doubtless is $2HO,C_4N_2O_2$. It is omeric with cyanic acid. Fulminic acid separated from the oxide of mercury and and combined with other bases, such as and all such compounds are more or less e.

TON, ROBERT, a celebrated American engid inventor, born near Lancaster, in Penn-, in 1765. When a mere child, he manihat taste for mechanics which he cultivated much success in after-life. While other his age were engaged in play, he found his ent in visiting the workshops of Lancaster. he was about seventeen years of age, he as a painter of portraits and landscapes in lphia; he was so successful, that he not pported himself and his widowed mother, able, in a few years, to lay by a sum sufli- purchase a small farm. In 1786, he visited , where he pursued the study of his art under tion of his celebrated countryman, West. rwards resided for some time in Devonshire, ame acquainted with the Duke of Bridgend Lord Stanhope, through whose influence, ould appear, his attention was turned from er pursuit to mechanics and civil engineering. , he was associated in a project to improve navigation: he was already familiar with a of using steam as a propelling power for About this time, he invented a machine for ; flax, and another for making ropes, for ne obtained patents in England. In 1796, lished a treatise on the improvement of avigation. From 1797 to 1804, he resided is with Mr Joel Barlow, the American ntative at the French court. During this he invented a submarine or plunging boat, a *Torpedo*, designed to be used in naval . He invited the attention of the French ment to his invention, and Bonaparte, then Consul, appointed Volney, La Place, and as a commission to examine it. Several ents were made in 1801 in the harbour of He could easily descend to any depth, or the surface; and where there was no strong , the boat was quite obedient to her helm nder water. On one occasion, he remained torpedo several feet below the surface for an four hours; but the motion of the boat ubmerged was very slow, and it was clearly to the stemming of a strong current. The government declined to patronise the pro- of F. accepted an invitation from the English , who also appointed a commission to test rits of his torpedo. He appears, however, received but little encouragement, and in returned to the United States. Having pplied with the necessary funds by Robert ton, who had been American ambassador . F. had the satisfaction of proving, in 1807, eam could be applied to the propulsion of with entire success. His achievement excited al admiration, and from that time steamere rapidly multiplied on the waters of the States. His first boat, the *Clermont*, made regular trips between New York and Albany at the rate of five miles an hour; but this rate was soon increased by improved machinery. F. had married, in 1806, Harriet, the daughter of Walter Livingston. In the midst of his triumphs and in the height of his fame, he died, on the 24th of February 1815. He left four children.

Others had previously conceived the idea of using the power of steam in navigation, and as early as 1789, a steam-boat 60 feet long, which sailed at the rate of seven miles an hour, had been tried on the Forth and Clyde Canal, and was abandoned through fear that the undulation produced by it would injure the banks of the Canal. See STEAM NAVIGATION. This experiment was known to F.; but to him is unquestionably due the credit of being the first to carry the idea into practice with complete success.

FUM, or, more properly, **FUNG**—the first being the Portuguese pronunciation of the word; the Chinese Phœnix—one of the four symbolical animals supposed to preside over the destinies of the Chinese empire. Its appearance indicates an age of universal virtue, the influence of which has extended throughout creation. It is supposed to originate from the element of fire, and to be born in the Tan-heuê, or Hill of the Fiery Halo of the Sun; to have the forepart of a goose, hind-quarters of a stag, neck of a snake, fish's tail, fowl's forehead, down of a duck, dragon's marks, the back of a tortoise, face of a swallow, and beak of a cock, with beak, claws, and feathers of various colours, red crest, and golden beak. It is about six cubits high, and comes from the East. In mystical language, it is called the Leih-kwan, or 'mandarin of time,' and it is said to have a forehead like heaven, eyes like the sun, back like the moon, wings like the wind, feet like earth, and a tail like the planets. On its body are inscribed the five cardinal virtues. According to some authors, it only perches on the woo-tung tree, and eats the seeds of the bamboo; others describe it as swallowing small carp. Other accounts say it eats no living insect, and treads on no growing plant. Its voice is said to be like a flute, drum, or even thunder. When seen, it is followed by birds. According to Chinese history, it has occasionally appeared; and a celebrated female flute-player, named Lung-yu, is said to have enticed it from heaven with her music, and then fled away with it. Like the phœnix of the Egyptians and roc of the Arabs, the bird may have had a historical origin, subsequently disfigured by fiction. It is often represented on Chinese works of art, under the form of a gallinaceous bird, and is embroidered on the dresses of mandarins of a certain rank. It is mentioned by some modern English poets.—Kidd, *History of China*, p. 267; Ching-tsze-tung, 172 sect.; Yuen-keen-luy-han, 148 sect.

FU'MAGE, in the Law of England, was properly smoke-farthings, or a customary payment for every house that had a chimney or fire-hearth. This tax is mentioned in Domesday as paid by custom to the king for every chimney in the house. Edward the Black Prince is said to have imposed a tax of a florin for every hearth in his French dominions. The first statutory enactment on the subject in England is by 13 and 14 Car. II. c. 10, whereby a tax of 2s. on every hearth in all houses paying to church and poor was granted to the king for ever. This tax was abolished 1 William and Mary, st. 1. c. 10.

FUMARIA'CEÆ, a natural order of exogenous plants; herbaceous, with a watery juice; their leaves alternate, much divided; the calyx of two deciduous sepals; the corolla of four very irregular

petals; the stamens sometimes four and distinct, more generally six and in two bundles; the ovary free, one-celled, one-seeded, or many-seeded; the seeds having large albumen. The F. are regarded as in their botanical characters approaching most nearly to the *Papaveraceæ* (Poppy, &c.); but their general aspect is very different, and they do not possess the same powerful properties. Both the foliage and flowers of some have considerable beauty. *Dielytra spectabilis* is a well-known favourite in gardens and green-houses. More than one hundred species are known, mostly natives of temperate climates in the northern hemisphere. Several species of *Fumaria* and *Corydalis* are natives of Britain. The COMMON FUMITORY (*Fumaria officinalis*) is a very frequent weed in

Common Fumitory (*Fumaria officinalis*).

gardens and cornfields, but of rather delicate and beautiful appearance. It is annual, and easy of extirpation, where it springs up in excessive abundance. It was formerly much employed in medicine, having a high reputation as a tonic and diaphoretic, and although disused in Britain, is still esteemed in France as a remedy in scorbutic affections, chronic eruptions, &c. Some of the other species of fumitory possess similar properties. The leaves have an intensely bitter saline taste.

FUMA'RIC ACID, known also as Boletic Acid ($2HO,C_8H_2O_6$), is of frequent occurrence in the vegetable kingdom. It was first obtained by Braconnot from a species of boletus, and has since been found in many other fungi, in numerous lichens, in various species of Fumaria, in Corydalis bulbosa, &c.

Fumaric acid may also be obtained, in association with malæic acid, by heating Malic Acid (q. v.) to 350° F.

It crystallises in prisms, which have a very acid taste, are only slightly soluble in water, but dissolve readily in alcohol and ether. At a temperature of 392° F., it volatilises without fusing, and is converted into the malæic acid already mentioned, which possesses the same composition as fumaric acid, but different properties. If malæic acid is exposed for a long time to a temperature of 266°, it again passes into fumaric acid, so that these acids are mutually convertible.

Kekulé has recently shewn (*Annalen d. Chemie*, 1861) that both fumaric acid and malæic acid combine directly with bromine, and produce crystals of dibromo-succinic acid; and further, that if fumaric acid be dissolved in water, and digested with an amalgam of sodium, the nascent hydrogen from the decomposed water combines with the acid, and converts it into succinic acid. Its compounds are of no special interest.

FU'MIGATING PA'STILS are composed of various ingredients, which, by their smouldering combustion, evolve agreeable odours. The following recipe for their composition is given in the Würtemberg Pharmacopœia: Take of benzoin and dry balsam of Peru, each 16 parts; of yellow sandal-wood, 4 parts; of labdanum, 1 part; of charcoal from lime-tree wood, 96 parts; of nitrate of potash, 2 parts; and of mucilage of tragacanth, enough to form the mixture into a paste, from which conical pastils are to be made by a small mould.

The 'Ribbon of Bruges' is also employed for aromatic fumigation in the same manner as pastils. It is prepared as follows: Dissolve two ounces of nitrate of potash in a pint of water; in this fluid, steep good undressed cotton-tape, and hang it up to dry. Prepare a tincture composed of spirit, half a pint; musk, half an ounce; otto of roses, one drachm; benzoin, four ounces; myrrh, half an ounce; orris-root, half a pound. When this tincture has stood for a month, steep the prepared tape in it. The tape when dried is fit for use. Light it, blow out the flame; and as it smoulders, a fragrant vapour will rise into the air. For further information on this and allied subjects, see Piesse's *Art of Perfumery*.

FUMIGA'TION (Lat. *fumigatio*, from *fumus*, smoke), the cleansing or medicating of the air of an apartment by means of vapours, employed chiefly for the purpose of detaching infectious poisons from clothing, furniture, &c. See CONTAGION, INFECTION. Most of the methods of fumigation formerly employed have little real value, and are to be looked on chiefly as grateful to the senses; as, for instance, the burning of frankincense, camphor, &c. The really active processes are noticed under the article DISINFECTANTS.

FUNCHA'L, the capital and the only town of the island of Maderia (q. v.), is situated on the south side of the island, and consists chiefly of one street, extending for about a mile along the shore, and of numerous streets and lanes at right angles with the main street, and leading up the hill which backs the town. Its roadstead is open, and its anchorage rocky and uneven. F. has a cathedral, numerous churches, and small convents, and is defended by four forts. From it all the produce of the island is exported.

FUNCTIONS, a mathematical term. When two or more variables are combined with constants in the equation, and are such that a change of value of one implies a corresponding change of value of one or more of the others, then such variables are said to depend on, and to be functions of each other; and the expression of the mode of dependence is said to be a *function* of such variables. If such an expression involves but one variable, it is said to be a function of one variable; if two are involved, to be a function of two variables; and so on. Thus $\sin x$, e^{ax}, $\log. x$, $\sqrt{a^2-x^2}$ are functions of one variable—viz. of x; e^{ax+by}, $\tan(ax+by)$, x^y, are functions of two variables, x and y; so xyz, $x^2+y^2+z^2$ are functions of three variables, and so on. Functions are denoted by the symbols F, f, ϕ, ψ, &c. Thus $F(x)$ means a function of one variable, x, combined with constants or not, as the case may be; $\psi(xyz)$ a function of three variables. These functional symbols are *general*, and their

specific forms are the particular functions which arise from operations in algebra, trigonometry, &c.

Functions are implicit or explicit. When one variable is expressed in terms of others, it is said to be an explicit function of them; but when all the variables remain involved in one expression, the function is said to be implicit. Thus, $x^2 + y^2 - r^2 = 0$ is an implicit function of two variables, but $y = \sqrt{r^2 - x^2}$ is an explicit function of one variable. In explicit functions, the variable which is expressed in terms of the others is called the *dependent* variable, and the others the *independent* variables. Explicit functions are usually written in the form $z = f(xy)$; implicit in the form $u = F(xyz) = 0$. Functions, again, are algebraical or transcendental. Algebraical functions are those which involve the operations of addition, subtraction, &c., and of involution and evolution. Transcendental functions are those where the operations symbolised are such as e^x, $\log_x$, x, $\sin x$, &c.—i. e., exponential, logarithmic, or circular. Functions, also, are simple or compound according as they involve one or several operations. $y = \sin x$ is a simple function; but $y = \log. \sin x$ is compound. Further, functions are divided into the continuous and the discontinuous, the circulating and the periodic. Continuous functions are such as are subject to the following conditions: 1. As the variable gradually changes, the function must gradually change; 2. The law symbolised by the functional character must not abruptly change. Circulating functions are those whose values lie within certain limits for all values of the variables. $y = \sin x$ is an example at once of a continuous and of a circulating function. A function is said to be periodic when it takes the form $f^n(x) = x$, signifying that if on x the operation f be performed n times, the resulting value will be x. Thus, $f(x) = \frac{1}{1-x}$ is a periodic function of the third order. For performing the operation indicated by f the second time on $\frac{1}{1-x}$ as the variable, we have $f^2(x) = \frac{1}{1-\frac{1}{1-x}} = -\frac{1-x}{x}$; and the third time we have $f^3(x) = \frac{1}{1-\left(\frac{1-x}{x}\right)} = x$. The functional calculus is a recent growth of the transcendental analysis. The object of the Differential Calculus (q. v.) is generally to ascertain the changes in functions arising from the continuous and infinitesimal variation of their subject variables. The object of the new functional calculus is, speaking generally, to investigate the forms of functions and their growth, when they are subject to a continuous and infinitesimal change as to form. According to Mr Price (treatise on the Infinitesimal Calculus), as the differential calculus investigates properties of continuous numbers, so does the new calculus the properties of continuous functions; and as there is an integral calculus of numbers, so there is an inverse calculus of functions. Of the new calculus, the Calculus of Variations (q. v.) may be considered the main branch. It includes, of course, the subject of functional equations. Functional equations are those in which it is required to determine from equations the forms of functions entering them: e.g., what is the function of x and y which satisfies the equation $f(x) \cdot f(y) = f(x + y)$? See article CALCULUS OF FUNCTIONS in the *Encyclopædia Metropolitana*.

FUND, FUNDING SYSTEM. Fund (Lat. *fundus*, ground, foundation) means a supply of money or a source whence money may be obtained. When we speak of 'the funds' in this country, we mean that great organisation for buying and selling the right to become a public creditor, and receive a share of the interest of the national debt. See DEBT, NATIONAL. When money has in this country been borrowed for public purposes, and it has been found that it cannot be repaid as a temporary loan, the resolution to hold it as a perpetual loan at a certain interest has been called 'funding it; and hence we read from time to time that certain obligations were converted from floating into funded debts.

FUND, SINKING, a plan pursued for a considerable period for the purpose of collecting money for the payment of the national debt of Great Britain. It was begun in 1716 by Sir Robert Walpole. Certain taxes which had previously been laid on for limited periods were then rendered perpetual, for the purpose of paying the interest of the funded debt. They produced more than enough for this purpose, and the surplus was laid aside, that it might accumulate into a fund for extinguishing the debt. It appeared to operate well, since, in 1728, after it had existed for twelve years, debt was wiped off to the extent of £6,648,000. It was not observed that, during the wiping off, new debt had been created to about the same extent, so that the nation was just in the position in which it would have been had it neither borrowed nor repaid. It is supposed that Sir Robert may have seen the fallacy of the sinking fund, since in 1732 he took half a million from it to meet the expenditure of the year, instead of raising a new loan. It was in 1786, however, that the system was established on a great scale by the younger Pitt, who, notwithstanding his great practical abilities, was entirely misled by the theories of Dr Price in his work on Annuities. The system continued to be conducted on an enormous scale, until another student of economy and figures conclusively proved it to be useless; this was accomplished in 1813 by Dr Hamilton, in his *Inquiry concerning the Rise and Progress, the Redemption and Present State, and the Management of the National Debt of Great Britain*. The fallacy which Dr Hamilton shewed to pervade a sinking fund may be best explained by a simple example. Suppose that one requires to borrow £100, and lays by £5 a year as a fund to pay it up with. Accumulating at compound interest, this fund will pay back the loan in about fifteen years. The borrower will, however, gain no more by the process than if he paid the £5 a year to his creditor, for his debt would be diminishing to precisely the same extent as the fund to pay it off would be increasing. Suppose that while requiring only £100, the borrower raises £200, and lends out one of them, accumulating the interest until the whole amounts to £200; the borrower will no doubt be receiving interest on £100, but he will be at the same time paying interest on £200; and he would repay his debt at the same cost and with more simplicity if, instead of borrowing the second hundred at 5 per cent., he paid over £5 a year to his creditor. In these instances, nothing is lost by the sinking fund. But suppose that in the last case the creditor had agreed to lend the £100 at 5 per cent., but in consideration of the greater risk, would not lend the £200 at less than 6 per cent., while the borrower can only get 5 per cent. for the half which he relends: here the transaction would cause a dead loss of £2 a year over the plan of repaying by instalments. This was exactly the case with the British sinking fund. The more money the chancellor of the exchequer wanted, the higher were the

terms demanded by the lenders, and the addition to each loan for setting aside a sinking fund increased the rate of interest paid on it.

FUNDAMENTAL BASS, in Music, is the root or fundamental note of the harmony. See HARMONY.

FUNDI, or FUNDUNGI (*Paspalum exile*), a kind of grain much cultivated in the west of Africa. It is allied to the millets, and still more nearly to some of the kinds of grain cultivated in India. See PASPALUM. It is wholesome and nutritious, and has been recommended to attention in Britain as a light and delicate food for invalids. The natives of Western Africa throw it into boiling water, pour off the water, and add palm-oil, butter, or milk. By Europeans and negroes in Sierra Leone, it is much used with stewed meat, and sometimes made into porridge with milk.

FUNDY, BAY OF, an arm of the Atlantic, separates Nova Scotia from New Brunswick and the state of Maine. With an average breadth of 35 miles, it extends 180 miles in length from north-east to south-west. It forks, at its head, into two inlets, the northern, called Chignecto Bay, and the southern, Minas Channel, which are divided by narrow necks of land from the Gulf of St Lawrence. Along its north-west side, reckoning downwards, it receives the St John, which is the principal river of New Brunswick, and the St Croix, which, through its entire course, forms the international boundary. The navigation is rendered perilous by the peculiarity of the tides, which are said to rise and fall fully 70 feet.

FUNERAL EXPENSES, in Law. If limited to the degree and quality of the deceased, funeral expenses are a privileged debt, allowed before all other debts and charges, both in England (3 *Inst.* 202) and in Scotland (Stair, iv. 35, 3). If the parties primarily liable neglect the duty of giving decent burial to the dead, a stranger may do so, and claim reimbursement out of his effects before all others having right, whether heirs or executors. The amount of expenditure which a court of law will consider reasonable varies so entirely with the circumstances, that it is needless to attempt to define it otherwise than by saying that it must be in accordance with common custom and common sense. In Scotland, it is held (Buchanan *v.* Ferrier, 14th February 1822) that mourning for the widow and such of the children of the deceased as were present at the funeral is a valid charge; but the reverse is the case in England, it having been decided (Johnson *v.* Baker, 2 C. and P. 207) that the widow has no claim for mournings either against the executor or the creditors of her husband. All along there seems to have been rather greater liberality in this matter in Scotland than in England, where Lord Holt held that nothing was allowable against a creditor except for the coffin, ringing the bell, parson and clerk (1 Salk. 296).

FUNERAL RITES. The methods of disposing of the dead have been so various, and connected with so many ceremonial observances dictated by affection, religious conviction, or superstition, that a full consideration of the subject would occupy a volume. Under the article BURIAL will be found a description of the principal modes of interment, and the accompanying funeral rites of the ancients.

With the spread of Christianity came the decorous interring of the dead with religious ceremonials indicative of hopes of a blessed resurrection. From the moment of death until interment, the body is the object of solemn ceremonial in the Roman Catholic Church. At death, a crucifix is placed in the hand, or at the feet, and holy-water is sprinkled. The chief funeral rites are solemnised in the church, into which the coffin is borne and placed on a bier. Throughout France, the Netherlands, and continental Europe generally, the ordinary cortège of a funeral is a hearse with a bier, on which is the coffin, covered with a pall, followed by carriages all in black, with black horses. The same arrangement is pursued in England, but the hearse, sometimes over-decorated with dark plumes, is closed instead of being open. In the more common class of funerals, the coffin, shrouded in a pall, is borne on spokes, or on the shoulders of bearers. All the attendants are in black. A certain etiquette as to pall-bearers (parties who hold ribbons attached to the pall) is observed; the relatives of the deceased taking their place nearest the head in the degree of consanguinity, and the same arrangement is maintained in lowering the coffin by cords into the grave. Only in exceptional cases are bodies put in leaden coffins and deposited in vaults; the common sense of the people now appreciating the propriety of allowing corpses to dissolve and mingle with the earth of the grave; and for this practice, the numerous new cemeteries offer facilities. Scottish Presbyterians, as is the case with some English dissenters, have no funeral-service, unless we reckon as such a prayer, and occasionally the reading of a chapter of Scripture, by a clergyman before the body is borne from the house; but in other respects the Scottish ceremonial differs little from the English. Formerly, in the case of important personages, the hearse was preceded by a class of undertaker's men to clear the way, designated *saulies*, and gumpheon-men—these last bearing a pole shrouded at the top with black silk, called a gumpheon (*gonfalone*, a banner), being a relic of an ancient heraldic ceremonial; but this custom has nearly, if not altogether, disappeared. At Scotch funerals, the relatives, and in some cases the friends of the deceased, wear white cambric *weepers* at the wrists. Till within the present century, there was a practice of giving a series of expensive entertainments to guests at Scottish funerals, beginning with the *lykwake*, and ending with the *dredgy* (dirge); but all this is gone, or nearly so. The giving of costly entertainments was not, however, confined to Scotland, or to Ireland. Taking its rise in ancient customs which were perpetuated by the Anglo-Saxons, the practice of consuming meat and drink in a species of gloomy festivity at funerals was common in England, and carried to an extravagant length at the decease of persons of distinction, on which occasion Doles (q. v.) were also given. It had even its counterpart in the usages of the ancients. The *nekrodeipnon*, or funeral-banquet, is mentioned by Lucian and Cicero. It was always celebrated in the house of the nearest relative of the deceased, and Demosthenes, the patriot orator of Greece, tells us in his Oration, *On the Crown*, that the relatives of those who were slain at Chaeroneia, were entertained by him in his own mansion, as if he were the nearest kinsman of the fallen heroes. The *nekrodeipnon* is often represented on funeral monuments. For some curious information respecting old funeral entertainments, we refer to Brand's *Popular Antiquities*, edited by Ellis. Without losing as regards decorum, funeral arrangements have been greatly cheapened in most large towns in England and Scotland by means of funeral-conducting establishments belonging to societies or private speculators. W. C.

FÜNFKIRCHEN ('Five Churches;' Hungarian, *Pecs*), an important town of Hungary, capital of the county of Baranya, is situated on the southern slope of the Mecseg Mountains, near the Slavonian boundary, 105 miles south-south-west of Pesth. It is the seat of a bishop, and is one of the oldest,

ll as one of the most pleasantly situated eautiful towns of Hungary. It formerly ed a university. The most important of its gs are the large and imposing cathedral, ishop's palace, an Italian structure, the ouse, lyceum, gymnasium, seminary, and the es, which are numerous and beautiful. It has ant tanneries, woollen and flannel weaving k-spinning; produces wine, fruit, and tobacco, al-mines and ironworks, and a flourishing n hogs and gall-nuts. Pop. 15,900.

NGI, an order of acotyledonous or crypto- s plants, containing a very great number of , nearly 5000 being known, whilst it is prob- at the whole number existing is very much . They are amongst the lowest forms of vege- ife, and some naturalists of no mean reputation ntertained the notion that they spring into ce in certain circumstances, not from germs sly existing, but from a mucus capable of ation, or through changes in the cells of more organised plants, and of animals in states of or of decay; an opinion which, however, is enerally rejected as having no foundation in e observation, as not necessary to explain diness with which certain fungi almost inva- spring up in certain circumstances—from is derived the chief argument in its favour, ased to all analogy of ascertained facts, and lered improbable by the abundant provision all the fungi possess for the perpetuation and n of the species. Fungi are cellular plants, lls sometimes elongated so as to become ts. They consist of a *thallus*, which spreads natrix, and is nourished by it, and from stems are thrown up into the air, bearing uctification. The organs connected with cation are often the principal part of fungi, e thallus very small, consisting of a few threads, or closely compacted cells, or even her undiscernible. Not unfrequently, how- he proportion of the thallus is compara- great, and in circumstances unfavourable to velopment of the organs of fructification, it s itself greatly in the matrix, as in the case of t, Ergot, &c. (q. v.), and even of the common orn. The thallus of fungi is called *mycelium ushes*, a mushroom), and in mushrooms and ther kinds is further popularly known as *ven*. Fungi are nearly related to algæ and ens, but differ from both in deriving their ment from the earth or from the bodies upon they grow, not from the medium by which e surrounded. They differ also from lichens r generally much softer substance and their us character; also in being quite destitute of granules (*gonidia*) in the thallus, which are eristic of that order. They differ from algæ iving immersed in water or other liquid, but ng their fructification in air. The lowest f fungi, and the lowest forms of algæ, are nes, however, not easily distinguished; and celium of some fungi is capable of spreading quid, and assuming a modified appearance ely resembling that of some algæ. It is d to be the presence of the *mycelium* of fungi which makes liquors 'mothery;' and nilar cause is ascribed the ropiness of the n some bakehouses, an evil not easily cured. other plants in general, fungi differ in their l composition, which is remarkably nitro- and assimilates them to animal organisms; unlike other plants, they do not absorb car- cid from the air, and give out oxygen, but, imals, absorb oxygen, and give out carbonic e that some naturalists have proposed to constitute for them a distinct kingdom of nature intermediate between the animal and the vegetable.

Fungi are very various in size, many being scarcely visible without a microscope, whilst others are some feet in diameter. Even the same species, however, often exhibits great variety, not only in size, but in other particulars, according to the different circumstances of its growth, causing great difficulty to the botanist, whilst further difficulty arises from the modifications of imperfectly developed mycelium, of which many spurious genera have been constituted. A great resemblance in general appearance to fungi is sometimes exhibited by diseased portions of leaves, &c., and by the secretions caused by the attacks of insects.—When the spore (seed) of a fungus germinates, it sends out radiating filaments, which generally branch and interlace, and portions of this mycelium removed to another favourable situation, grow there, so that fungi are propagated by this means as higher plants are propagated by their tubers or by the division of their roots. The fungi of simplest structure or lowest organisation consist of nothing more, when they have reached their fullest development, than masses of spheroidal cells, spores, breaking up into a fine powder, as in some of the small parasitic species which are very injurious to corn. Sometimes these cells are united into jointed threads. In species of rather higher organisation, the plant consists of jointed threads, but the spores are formed in the enlarged terminal joints, and are dispersed by their bursting. In the higher kinds, the spores are produced in or on peculiar organs of extremely various shape and character. In some, as puff-balls, the whole interior of the plant is filled with the fructification. In agarics, boleti, morels, &c., the fructification takes place on a particular membrane, a part of the external surface of the plant, called the *hymenium*, variously situated (in agarics on the under side of the *pileus* or cap), the extent of which is often greatly increased by wrinkles, plates or *gills*, pits, pores, &c. These form the highest division of fungi, called *Hymenomycetes*, in the system of Fries, the greatest continental authority in mycology, as this department of botany is sometimes termed. Berkeley, who, without any near rival, occupies the first place among the mycologists of Britain, divides fungi into two 'classes;' the first class not having the spores enclosed in tubular sacs (*asci*) or vesicles, and containing the 'orders' *Hymenomycetes* (agarics, boleti, &c.), *Gasteromycetes* (puff-balls, &c.), *Coniomycetes* (rust, smut, &c.), *Hyphomycetes* (mould, mildew, *botrytis*, *oidium*, &c.); the second class containing two orders, *Ascomycetes* (morels, truffles, &c.), in which the spores are definitely arranged in *asci*, and *Physomycetes* (some kinds of mould, plants which grow on fermenting substances, and some of the minute pests of cultivated plants) in which the spores are in vesicles without definite arrangement.

Fungi generally grow in damp situations, but there are many which occur chiefly on dry soils or on dry substances; and some appear in their greatest perfection in the finest summer weather, although many are most abundant in the colder and moister seasons of the year. It has been commonly asserted that they abound more in the colder parts of the world than within the tropics, but it is not improbable that this opinion has its origin merely in imperfect observation of tropical species. The extreme rapidity of their growth, the briefness of their whole existence, the readiness with which they pass into decomposition, and the difficulty of preserving most of them in a form fit for examination, have been great obstacles to their scientific study. It is known, however, that some species are of very wide geographic distribution, whilst others are comparatively

very limited. Some species grow in earth, others in various kinds of putrescent or fermenting animal or vegetable matter, many in decaying parts of trees or on dead wood, others on diseased animal and vegetable tissues, &c. It appears to be the office of many of them to hasten the decomposition of animal, and more particularly of vegetable substances. Some of the minute kinds appear to be the cause of disease in the higher kinds of plants which they attack, and are formidable to the farmer and the gardener. Some are in like manner destructive to animal life, as in the case of the Muscardine (q. v.) or Silk-worm Rot, and certain species of *Sphæria* which grow from living caterpillars. See ENTOPHYTES.

Some fungi are remarkably phosphorescent. Thus the undeveloped mycelium of some kind produces a very beautiful luminosity in some German coal-mines; and a species of agaric (*Agaricus Gardneri*), growing on palms in Brazil, shines brightly in the night. *Agaricus olearius*, a native of the south of Europe, is also luminous.

The chemical examination of fungi yields in large quantity a substance called *Fungine*, which, however, is now regarded as consisting of cellulose and fatty matter, several other nitrogenous substances, an acid called *Fungic Acid*, a kind of sugar, &c. The poisonous properties of some are ascribed to an alkaloid called *Amanitine*. Others appear to owe their poisonous character to an acrid volatile substance. Many of the smaller fungi are important because of the injury which they cause to crops, timber, &c. A few species are used in medicine, of which the only one really important is Ergot of Rye. One or two are used as tinder (see AMADOU), Moxa (q. v.), &c. The smoke produced by burning the dust (spores) of ripened puff-balls has anæsthetic properties, and is used for stupifying bees. *Polyporus squamosus* cut into slices makes the best of razor-strops. But the chief economical use of fungi is for food, and in the manufacture of the sauce called Ketchup (q. v.).

Edible Fungi.—Many fungi of the sub-orders *Hymenomycetes*, *Gasteromycetes*, and *Ascomycetes* are edible; and some of them are much esteemed as delicacies, whilst in many countries they constitute an important part of the food of the people. In Britain, very few are used, many of those species which are most esteemed on the continent of Europe being utterly disregarded, and indeed classed in popular estimation with toad-stools as poisonous. The truth appears to be, not that the greater number are poisonous, and only a few edible, but that the noxious species are comparatively few, the principal danger arising from the similarity of some of the poisonous and some of the edible agarics, and from the liability of some of the edible species to acquire poisonous properties in particular situations and circumstances. This is notably the case with the common mushroom (*Agaricus campestris*), which is far more generally used in Britain than any other edible fungus, but of which some varieties are unsafe, apparently in consequence of the circumstances of their growth. From the markets of Rome, and other cities of Italy, where numerous species of fungi are extensively sold, this species is rigorously excluded. So important an article of food are fungi in Italy, that in the market of Rome alone they are supposed to be sold to the value of about £4000 a year. For weeks, both in spring and in autumn, fungi form the principal and almost the sole food of multitudes of the poor in Italy, Germany, and France; and besides those which are eaten fresh, great quantities are used dried or preserved in oil, vinegar, or brine. The soaking of fungi in vinegar or brine takes away the acrid qualities of some which are dangerous when fresh, and renders them perfectly safe. So valuable are fungi esteemed, that some species are frequently cultivated. The cultivation of the Common Mushroom (q. v.) is familiar to us in Britain, but other species of *Agaricus*, *Boletus*, &c., are plentifully raised in some parts of the continent of Europe, by watering the ground in places appropriate for them with water in which mature plants abounding in spores have been bruised; others are obtained by merely placing in favourable circumstances substances in which their spores are already contained. Thus, a species of *Polyporus*, much esteemed, is procured in Italy by moistening a porous stone (Ital., *Pietra fungaia*) over which a little earth has been scattered; another species of *Polyporus* by slightly charring and then watering blocks of the wood of the common hazel; a species of *Agaricus*, by cutting off and then watering the heads of black poplar trees; and another *Agaricus*, by placing the grounds of coffee in circumstances favourable for its growth.

It is a common notion, but utterly destitute of foundation, that dangerous fungi may be distinguished from those which it is safe to eat by their discolouring a silver spoon if they are stirred with it whilst they are being cooked. Nor is greater dependence to be placed on the rule that the more readily deliquescent fungi are poisonous; nor on peculiarities of colour of the flesh or juice, except in so far as these characters may avail for the discrimination of particular species, the qualities of which are known. The edible fungi have generally an agreeable smell and taste, whilst some of the poisonous kinds are offensive both to the nostrils and the palate, but no trustworthy general rule can be laid down on these points; and some of those which are very pungent and acrid when raw, become bland and wholesome when cooked, their acridity being dissipated by heat.

Among the most important edible fungi are:

Hymenomycetes.—The Common Mushroom, Champignon, and numerous other agarics and fungi closely allied to true agarics, as species of *Cortinaria*, *Cantharellus*, &c. These will be noticed in the article MUSHROOM.

A number of species of *Boletus* (q. v.), and of *Polyporus*. See AMADOU. *Fistulina hepatica*. See FISTULINA. Several species of Hydnum (q. v.). Several species of *Clavaria*, some of which are found in

Clavaria Botrytis.

Britain; beautiful fungi, with a thickish stem which divides into numerous small branches. It is said that all the species of this genus are esculent, although some are very superior to the rest in flavour and delicacy. One species (*C. flava*) is popularly known in Germany as *Ziegenbart* or Goat's-beard. They grow on the ground in woods and pastures.

Gasteromycetes.—Different kinds of Puff-ball (q. v.), in a young state, and whilst still fleshy throughout.

Ascomycetes.—Different species of Morel (q. v.

Helvella (q. v.), *Verpa*, *Peziza*, &c. The Common Truffle (q. v.), and allied species. *Cytteria Darwinii*, which grows on living branches of South American beeches, and forms a principal part of the food of the natives of Tierra del Fuego during some months of the year.

'It is a curious fact that the poisonous properties of mushrooms vary with climate, and probably with the season of the year at which they are gathered. Another circumstance deserving of notice is, that by idiosyncracy some individuals are liable to be seriously affected even by those species which are usually regarded as innocent. Some species which are poisonous in this country, are used freely by the Russians; it appears they are in the habit of salting, boiling, and compressing them before they are eaten; and this may in some instances suffice to account for their having no noxious effects.

'*Symptoms and Effects.*—The noxious species of mushrooms act sometimes as narcotics, at others as irritants. It would appear from the reports of several cases, that when the narcotic symptoms are excited, they come on soon after the meal at which the mushrooms have been eaten, and that they are chiefly manifested by giddiness, dimness of sight, and debility. The person appears as if intoxicated, and there are singular illusions of sense. Spasms and convulsions have been occasionally witnessed among the symptoms when the case has proved fatal. In some instances, the symptoms of poisoning have not commenced until thirty hours after the meal; and in these, narcotism followed the symptoms of irritation. It might be supposed that these variable effects were due to different properties in the mushrooms, but the same fungi have acted on members of the same family, in one case like irritants, and in another like narcotics. In most cases, recovery takes place, especially if vomiting be early induced. In the few instances which have proved fatal, there has been greater or less inflammation in the stomach and bowels, with congestion of the vessels of the brain.

'*Treatment.*—The free use of emetics and castor oil.'—Taylor *On Poisons*.

The esculent fungi of England are the subject of a work by Dr Badham, who enthusiastically recommends them to more general use.

FUNGIBLES. In the law of Rome, the contract of loan was divided into *mutuum* and *commodatum*, a division which has been adopted by the law of Scotland, and by most of the continental systems which are founded on the civil law. The former had reference to objects which admitted of being estimated by weight, measure, or number, or which could not be used without being given away or consumed. These objects, consisting of money, corn, wine, oil, and the like, could be used only by him who possessed the full right of ownership, and consequently the contract of *mutuum* transferred the ownership to the borrower, who became bound to return, not the object borrowed, but its equivalent. Objects of this nature, from the fact that they were got rid of one for another (*fungantur*), were called fungibles. The other class of movable objects, again, to which the Roman contract of *commodatum*, or hire, properly so called, applied, were transferred to the borrower on condition that he should return the same individual objects to the lender.

FUNGUS (Lat. a mushroom) is a term applied in pathology and surgery with several significations. Thus, any excrescence from a surface of skin, or mucous membrane, or even from deeper parts, is sometimes called a fungus, more especially if it have a soft mushroom-like character, and a broad short pedicle. When the pedicle is long and narrow, it is called Polypus (q. v.). The growths to which the term fungus is chiefly applied are those which have the characters of Cancer (q. v.); especially *fungus hæmatōdes*, a very dangerous variety. But fungus has yet another application in pathology, to those minute incrustations and alterations of the skin which are dependent upon the growth of vegetable parasites, as Favus, Ringworm (q. v.), &c.

FUNNEL (Lat. *fundo*, to pour), in steam-vessels, is the iron tube designed to convey away above the deck the smoke and gases set at liberty during the combustion of fuel in the boiler-flues, and also, from its height, to afford a sufficient draught to the furnaces. In large ships, the funnel is of great size; and in men-of-war, usually telescopic, so that, by simple mechanism, it may be withdrawn during an action from the chance of injury by cannon-shot.

FUNNEL, a conical vessel terminating in a tube, and used for pouring liquids into narrow-mouthed vessels, and in laboratories for filtering. See FILTER. For common purposes, they are made of tin-plate or copper, but when for corrosive liquids, they are made of glass or earthenware. In some parts of Great Britain, as in the midland counties of England, a funnel is called a 'tun-dish;' in other parts, a 'tiller.'

FUR is the term applied to the incrustation which is formed in the interior of vessels (tea-kettles, boilers of steam-engines, &c.) when calcareous water has been for a considerable time boiled in them. Many spring waters contain carbonate of lime held in solution by carbonic acid. When this water is boiled, the acid is expelled, and the carbonate is deposited, often in association with a little sulphate, forming a lining more or less coherent upon the sides of the vessel. In steam-boilers, this may be prevented by the addition of a small quantity of sal-ammoniac (hydrochlorate of ammonia) to the water: double decomposition takes place, carbonate of ammonia being formed and volatilised, while chloride of calcium remains in solution.

FUR AND FURRIERY. The skins of animals, having hair or fur as a coating, have been used in Europe as an article of clothing for many centuries. Since European countries, however, become more and more cleared and inhabited, fur-bearing animals have nearly disappeared; and the supply is now chiefly obtained from other regions, especially North America.

All the chief fur-bearing animals will be found described under their proper headings: we shall do little more here than barely enumerate them. *Ermine* fur is of a pure white, except the tip of the tail, which is black. The spotted appearance of this fur is not natural; it is produced by sewing the black tail-tips on the white fur at certain spots. *Stoat* fur is a kind of inferior ermine. *Sable* fur, obtained chiefly from Northern Russia and Siberia, is valued in proportion to the darkness of its colour. *Marten* fur, especially that of a rich dark-brown olive colour, is much sought for. *Fiery-fox* fur, brought chiefly from the north-eastern part of Asia, is admired both for its brilliant fiery colour and for its fineness. *Red-fox* fur, differing in some particulars from the kind just named, is much sought after by the Chinese for trimmings, linings, and robes. *Silver-fox* fur has a peculiar lustrous silver-gray colour. *Nutria* fur, belonging to the animal called the *coupou*, is brought largely from South America, chiefly as a cheap substitute for beaver. *Sea-otter* fur has been known in Europe about a century and a half, being obtained from the otters which frequent the seas washing the Asiatic shores of the Russian dominions; it varies from a beautiful brown to jet-black, and is very fine, soft, and glossy. *Seal* fur is

obtained from the seals frequenting various coasts, chiefly in the Southern Ocean. *Beaver* fur was once much in request for the manufacture of hats; but the growing scarcity of the animal, and the substitution of silk hats for beaver hats, has lessened its importance. The fur of various other animals is similarly valued, either for its warmth or its beauty; such as that of the *bear*, *racoon*, *badger*, *minx*, *lynx*, *musquash* or *musk-rat*, *rabbit*, *hare*, *squirrel*, and *chinchilla*.

For manufacturing purposes, furs are classified into *felted* and *dressed*. Felted furs, such as beaver, nutria, hare, and rabbit, are used for hats and other felted fabrics, in which the hairs or filaments are made so to interlace or entangle as to form a very strong and close plexus. The quality of the fur is better when the skin is taken from the animal in winter than in any other season, giving rise to the distinction between 'seasoned' and 'unseasoned' skins. The removal of the fur from the pelt is a necessary preliminary to the preparation of fur for felting purposes. In many kinds of skin, such as that of the hare, the fur is of two kinds—a close short layer of felting fur next the pelt, and longer outer hairs of unfelting fur. The removal of these two is effected separately. The long hairs are cut off by a kind of shears; and the true fur is then removed by the action of a knife, bearing some resemblance to a cheese-cutter, requiring much care in its management. In some sorts of skin, the long hairs are removed by pulling instead of shearing; in others, the greasiness of the pelt renders necessary a cleansing process before the shearing can be conducted, with the aid of soap and boiling water; and in others, both pelt and fur are so full of grease as to require many repetitions of cleansing. For beaver skins, a machine of very beautiful construction is employed in cutting the fur from the pelt. When the coarse hairs have been removed to form a stuffing for cushions, the skin is placed in a machine containing a broad keen blade equal in length to the width of the skin. This blade has a peculiar reciprocating movement given to it, producing a kind of chopping effect on any substance to which it is applied, by coming nearly in contact with another blade placed parallel with it. The skin is guided between rollers into the space between the two blades; and then the action of the upper blade crops off the fur from the pelt in a very complete manner—every particle being removed, and yet the pelt is not cut. The fur falls upon an endless apron, which carries it to a chest, or trunk, containing a blowing-machine; this machine separates the fur into three or four qualities, by blowing to the furthest distance the lightest and most valuable filaments, leaving the heavier and coarser to be deposited sooner.

Furs have their felting property sometimes increased by the process of *carroting*, in which the action of heat is combined with that of sulphuric acid. The chief employment of felted furs is described under HAT MANUFACTURE.

Dressed furs are those to which the art of the *furrier* is applied for making muffs, boas, and fur-trimmings to garments. The fur is not separated from the pelt for these purposes; the two are used together; and the pelt is converted into a kind of leather to fit it for being so employed. The fur-hunters always exercise great care in drying the skins after removing them from the animals, seeing that any putrefactive action would ruin the fur. When brought to England, the skins undergo certain cleansing processes. They are steeped and scoured in a bath of bran, alum, and salt, to remove greasiness from the pelt; and then in a bath of soap and soda, to remove oiliness from the fur. When thoroughly washed and dried, it is found that the pelt, by the action of the alum, has been converted into a kind of *tawed* or kid leather.

When the skins are cleansed and dried, they are made up into garments and trimmings by sewing through the pelt. The skins, however, are very irregular in shape, and often differ much in colour in different parts; they require to be cut up into pieces, matched according to tint, and sewn together edge to edge. This requires much skill, especially where the furs are of a valuable sort. A fur garment or trimming, appearing to the eye as if it were one uniform piece, is thus generally made up of many curiously shaped pieces. The shaping for use, and the lining with silk and other materials, call for no description.—The great source of furs is the Hudson's Bay Territory (q. v.).

FURFU'RAMIDE, FU'RFURINE, AND FU'RFUROL. When starch, sugar, or bran is acted upon by dilute sulphuric acid and peroxide of manganese, the distillate contains not only Formic Acid (q. v.), but a small quantity of an essential oil, which, after being purified by redistillation, is colourless, has a fragrant odour somewhat resembling that of bitter almonds, and when dissolved in cold sulphuric acid, forms a beautiful purple liquid. This oil is termed Furfurol, and its composition is represented by the formula $C_{10}H_4O_4$.

If furfurol be treated with ammonia, it is converted into Furfuramide ($C_{30}H_{12}N_2O_6$), which occurs in colourless crystals, insoluble in water, but soluble in alcohol, and perfectly neutral.

If furfuramide is boiled with a solution of potash, it dissolves, its elements assume a new arrangement, and the solution on cooling deposits long silky needles of a powerfully alkaline base, Furfurine, which is isomeric with furfuramide. It is dissolved by dilute acids, and completely neutralises them; and on adding ammonia to these solutions, the alkaloid is precipitated unchanged. It was discovered by the late Professor Fownes; and as the first vegeto-alkali artificially formed, its production was regarded as a great step in organic chemistry.

FURIDPU'R, a town of Bengal Proper, capital of a district of the same name, stands on the right bank of the Ganges, here called the Podda, in lat. 23° 36′ N., and long. 89° 50′ E. It is 115 miles to the north-east of Calcutta. Excepting the public establishments, which it possesses as the capital of the district of its own name, the place is mainly a scattered series of native villages; and, in fact, it claims notice chiefly as having at one time been a nest of river-pirates.

FURIDPU'R, or DACCA JELALPU'R, the district mentioned in the preceding article, stretches in N. lat. between 23° 3′ and 24° 5′, and in E. long. between 89° 30′ and 90° 15′, containing 2052 square miles, and 855,000 inhabitants. It is everywhere intersected by branches or feeders of the Ganges, which, as the surface barely rises above the level of the sea, are all, unless in the dry season, well adapted to navigation. The soil is in general rich; and the climate, more particularly from the beginning of March to the middle of June, is excessively hot.

FURIES. See EUMENIDES.

FURLONG (the length of a furrow), a measure of length, the eighth part of a mile, or 220 yards. See YARD.

FU'RLOUGH, a military term signifying leave of absence. Non-commissioned officers and private soldiers on furlough must be provided with a pass, or they are liable to be seized and dealt with as deserters.

IEAUX, the name of an English navigator, i second in command on Cook's second ndicates various localities in the southern ere.—1. Furneaux Strait separates the and South islands of the New Zealand 2. Furneaux Island, in the open Pacific, at. 17° S., and in long. 143° 6′ W.—3. Fur- lands are a group in Bass's Strait (q. v.). e numerous, the largest measuring 35 10. The soil is sandy, and the vegetation The centre of the cluster is about lat. d long. 148° E.

NES, a small town of Belgium, in the pro- West Flanders, is situated in a marshy and y district, 4 miles from the sea, and 27 miles th-west of Bruges. At this town, four t lines of canal meet. F. is well built, has ouse, a fine Gothic structure, richly orna- with carvings, and has interesting remains rmer Abbey of St Willebrod. It has a great horses, cattle, hops, and cheese; and has ual fairs, at which large quantities of linen Pop. 5000.

NITURE, the name of an organ-stop or consisting of two or more ranks of pipes to , all of a higher pitch than the 15th stop.

ITURE, Household, Hiring of. If ts out furniture for immediate use, there is d warranty that it is fit for use, and free defects inconsistent with the reasonable ficial enjoyment of it. Sutton v. Temple, son and Welsby, 60. The hirer must use the for a proper purpose. If it is applied to a inconsistent with the terms of the contract, sold by the hirer, the owner is entitled to an action for its value. These general y be regarded as prevailing both in England land. In case of wilful injury done to fur- y a tenant within the metropolitan police it is provided by 2 and 3 Vict. c. 71, s. 38, police magistrate may award compensation nount of £15. In England as well as Scot- use of furniture for life is often made the of a bequest; and in this case, allowance ade for ordinary wear and tear in the use rniture.

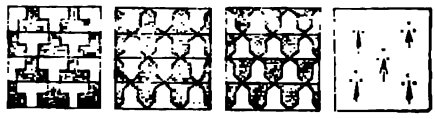
***n Furniture for Rent.*—As a general rule, ture found on the premises, whether the of the tenant or of a third party, may ained for rent, on the principle that the has a lien over it in respect of the place it is found, and not in respect of the whom it belongs. To this rule there are ceptions in favour of trade, as of tools in se, &c. In Scotland, the landlord has a ght over the furniture in a house, so that niture may be seized; but furniture lent payment of rent does not fall under this e (q. v.). Even where furniture has been landlord has a claim over it while it on the premises.**

RŬCKABA'D (Happy Residence), a city Doab (q. v.), stands near the right bank anges, in lat. 27° 24′ N., and long. 79° 40′ E. andsome, cleanly, and healthy place, 570 e the level of the sea, with a considerable d a population of about 60,000. Inde- y of its position on the grand artery of ntry, F. is within 20 miles of the great ween Calcutta and Delhi. Here Lord Lake the troops of Holkar in 1805.

RŬCKABAD, the district of which the he same name is the capital, stretches in etween 26° 46′ and 27° 43′, and in E. long. 78° 57′ and 80° 2′. With a population of 854,799, it contains only 1909 square miles, scarcely one-twelfth of the area being beyond the limits of the Doab. The commercial crops are principally cotton, tobacco, and indigo.

FURS, in Heraldry. Shields being often covered with the skins of wild animals, on which the fur was left, there came to be certain kinds of fur which were used in coat-armour, as well as in trimming and lining the robes of knights and nobles, and the mantles which were represented as surrounding their shields. The principal heraldic furs are—1. Ermine of which the field is white, and the spots black; 2. Ermines of which the field is black, and the spots white; 3. Erminois which has the field gold, with black spots; 4. Vair, which consisted of pieces of the shape of little glass pots (Fr. *verre*, of which the word is a corrupt spelling). It is said that the furriers used such glasses to whiten furs in, and because they were commonly of an azure (blue) colour, the fur in question came to be blazoned *argent* and *azure*; whilst counter-vair, in which the cups are represented as placed base against base, in place of edge to base, as in vair, was *or* and *azure*.

Furs.



Potent. Counter-vair. Vair. Ermine.

5. Potent and counter-potent, which are supposed to resemble the heads of crutches, placed differently, but having the same tinctures—viz., azure and argent.

FÜRST, Julius, a distinguished orientalist of Jewish parentage, was born 12th May 1805, at Zerkowa, in the grand-duchy of Posen, Prussia, where his father was Lecturer on Circumcision in the synagogue. F. was educated for the rabbinical profession, and displayed at a very early age a most remarkable power of acquiring knowledge. He studied at Berlin, where the German philosophy made sad havoc of his previous convictions. The conflict in his mind between science and rabbinical lore ended, in 1829, in the defeat of the latter, and F. immediately proceeded to Breslau, where he continued his oriental, theological, and antiquarian studies, which were completed at Halle in 1831, under Gesenius, Wegscheider, and Tholuck. In 1833 he went as a teacher of languages to Leipsic, where he still lives. Among his numerous and valuable writings may be mentioned *Lehrgebäude der Aramäischen Idiome* (System of Aramaic Idioms, Leip. 1835), a work which brought the Semitic languages within the sphere of comparative grammar, then in its infancy, and which, besides, sought to establish a system of analytico-historic investigation in regard to these languages themselves; *Perlenschnüre Aramäischer Gnomen und Lieder* (Pearl-strings of Aramaic Gnomes and Songs, Leip. 1836), with elucidations and glossary; *Concordantiæ Librorum Sacrorum Veteris Testamenti Hebraice et Chaldaice* (Concordances of the Sacred Books of the Old Testament in Hebrew and Chaldee, Leip. 1837—1840), a work of indefatigable industry and careful research, which has obtained for its author a great reputation both in Germany and other countries; *Ari Nohem* (Leip. 1840), a polemical treatise on the genuineness of the Sohar and the worth of the Cabbala; *Die Sprüche der Väter* (The Sayings of the Fathers, Leip. 1839); *Die Israelitische Bibel* (The Hebrew Bible, Berlin, 1838), translated into

German from the original, by himself, in conjunction with other scholars; *Der Orient; Berichte, Studien und Kritiken für Jüdische Geschichte und Literatur* (The East; Notices, Studies, and Criticisms in connection with Jewish History and Literature, Leip. 1840); *Die Jüdischen Religionsphilosophen des Mittelalters* (The Jewish Religious Philosophers of the Middle Ages, Leip. 1845); *Geschichte der Juden in Asien* (History of the Jews in Asia, Leip. 1849); *Bibliotheca Judaica* (1849—1853); and *Hebräisches und Chaldäisches Handwörterbuch* (Hebrew and Chaldee Manual, Leip. 1851—1854), preceded by a history of Hebrew lexicography.

FÜRSTENWALDE, a small walled town of Prussia, in the province of Brandenburg, on the right bank of the Spree, 30 miles east-south-east of Berlin. It has a brick church of the 14th c., the *Marienkirch*, which contains a fine Gothic *Sacramentshäuschen* (or pyx for keeping the host), built of sandstone, and dating from 1510. F. manufactures linens and woollens, and carries on some trade by river. Pop. 5890.

FÜRTH, a flourishing manufacturing town of Bavaria, in Middle Franconia, is situated at the confluence of the Rednitz and the Pegnitz, about 5 miles north-west of Nürnberg, with which it is connected by a railway, laid out in 1835, and the first that was completed in Germany. It has numerous churches, synagogues, a town-hall, theatre, &c. It is the most industrious and most prosperous manufacturing town of Bavaria; its mirrors, chandeliers, snuff-boxes, lead-pencils, its brass and wood wares, and its articles of dress, are famous. The making of metallic leaf, and the manufacture of articles in bronze, are most important branches of industry. F. also produces pinchbeck rings, watch-keys, brass nails, spectacles and optical instruments, in great abundance. An annual fair, lasting fourteen days, takes place at Michaelmas. Pop. 17,341, of whom 2500 are Jews, and the rest Protestants. F. first appears in history about the beginning of the 10th c., when it belonged to the archbishops of Bamberg. Subsequently it acknowledged the authority of the Burgrafs of Nuremberg. In 1634, during the Thirty Years' War, the Austrian Croats burned it to the ground. In 1680 a great fire almost laid it in ashes again. It first began to attain importance as a seat of manufactures in the latter half of the last century.

FURY AND HECLA STRAIT, lying in lat. 70° N., and long. from 82° to 86° W., separates Melville Peninsula on the south from Cockburn Island on the north, and connects Fox's Channel on the east with the Gulf of Boothia on the west. It is of no value whatever as a means of communication, nor is ever likely to be so, its western entrance having been ascertained by Captain Parry, who discovered it, on his second voyage, to be impenetrably closed from shore to shore by the accumulated ices of many years. It is traversed from west to east by a strong current, which passes down Fox's Channel into Hudson's Strait.

FURZE (*Ulex*), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, distinguished by a two-leaved calyx with a small scale or bractea on each side at the base, stamens all united by their filaments, and a turgid pod scarcely longer than the calyx. The COMMON F. (*U. Europæus*), also called WHIN and GORSE, is a shrub about two or three feet high, extremely branched; the branches green, striated, and terminating in spines; the leaves few and lanceolate; the flowers numerous, solitary, and yellow. It is common in many of the southern parts of Europe and in Britain, although it does not reach any considerable elevation on the British mountains, and often suffers from the frost of severe winters; whereas in mild seasons its flowers may be seen all winter, so that there is an old proverb, 'Love is out of season when the furze is out of blossom.' It is scarcely known in any of the northern parts of Europe; and Linnæus is said to have burst into exclamations of grateful rapture when he first saw a common covered with F. bushes glowing in the profusion of their rich golden flowers. F. is sometimes planted for hedges, but is not well suited for the purpose, occupying a great breadth of ground, and not readily acquiring sufficient strength; besides, it does not, when cut, tend to acquire a denser habit. It is useful as affording winter food for sheep, and on this account is burned down to the ground by sheep-farmers when its stems become too high and woody, so that a supply of green succulent shoots may be secured. In some parts of Wales, F., chopped and bruised, forms the principal part of the winter fodder of horses. In some places, it is sown to yield green food for sheep or other animals, but is preferable to other green crops only on dry sandy soils, where they could not be advantageously cultivated. It is most extensively cultivated in Flanders. It is chopped and bruised by means of a mallet, one end of which is armed with knife-blades; or by means of a simple machine, called a gorse-mill.—A double-flowering variety is common in gardens. A very beautiful variety, called IRISH F., became originally found in Ireland (*U. strictus* of some botanists), is remarkable for its dense, compact, and erect branches. A dwarf kind of F. (*U. nanus*) occurs in some places, and is perhaps also a mere variety; if so, there is only one species known.

In fox-hunting countries, F. is encouraged on account of the excellent *cover* it affords. It is also a favourite cover for rabbits.

FUSE, FUSEE, a tube of wood or metal, perforated down the side with a vertical row of holes, and used for firing shells. The tube is filled with a composition of nitre, sulphur, and gunpowder, which will burn gradually. The distance between each hole representing a second, the range and time of flight are computed, and that hole is left open which will communicate the fire in the fuse to the loaded shell at the moment the latter touches the ground after being discharged. Of course, when combustion reaches this aperture, the shell is burst by the explosion of the contained gunpowder, and scattered around in numerous fragments. Fuses constructed on a similar principle are used in exploding military mines (q. v.).

FUSEL or FOUSEL OIL, known also as POTATO SPIRIT, is a frequent impurity in spirits distilled from fermented potatoes, barley, rye, &c., to which it communicates a peculiar and offensive odour and taste, and an unwholesome property. Being less volatile than either alcohol or water, it accumulates in the last portions of the distilled liquor. According to Liebig, it is principally formed in the fermentation of alkaline or neutral liquids, while it never occurs in acidulous fermenting fluids which contain tartaric, racemic, or citric acid. It mainly consists of a substance to which chemists have given the name of amylic alcohol, whose composition is represented by the formula $HO,C_{10}H_{11}O$. It is a colourless limpid fluid, which has a persistent and oppressive odour and a burning taste. It is only sparingly soluble in water, but may be mixed with alcohol, ether, and the essential oils in all proportions. Any spirit which produces a milky appearance, when mixed with four or five times its volume of water, may be suspected to contain it.

Fusel oil is principally sold in this country for the

purpose of yielding pear essence for the so-called jargonelle-drops; it has likewise been patented as a solvent for quinine; and according to Liebig, it is sometimes employed in lighting distillery buildings.

FUSE'LI, HENRY, the second son of John Caspar Fuseli, or Fuessli, a portrait-painter, and author of *Lives of the Swiss Painters*, was born at Zurich in 1742. He studied in his native town and at Berlin, travelled with Lavater in 1761, and then went to England, where, by Reynolds's advice, he devoted himself to art. In pursuance of this object, he proceeded to Italy in 1770, where he remained for eight years, studying in particular the works of Michael Angelo, and in 1778 returned to England. In 1790 he was elected a member of the Royal Academy, where, nine years later, he became professor of painting. He died at Putney Hill, near London, 16th April 1825, and was buried beside his friend, Sir Joshua Reynolds, in St Paul's. His most remarkable works are 'The Ghost of Dion,' from Plutarch; 'Lady Macbeth;' 'Hercules and the Horses of Diomedes;' and his 'Milton's Gallery,' comprising 47 designs from *Paradise Lost*. F.'s imagination was bold, but coarse; he had more genius than art; and his execution was often spasmodic in the extreme. His art-criticism, however, strange to say, ranks among the best in the language. His literary works, with a narrative of his life, were published by Knowles (3 vols., London, 1831).

FUSIBI'LITY. With few exceptions, all solids which can bear a high temperature without undergoing chemical change, may be melted. Many substances which are popularly regarded as infusible—as, for example, platinum and flint—readily fuse before the oxyhydrogen blow-pipe, or between the poles of a powerful galvanic battery; even carbon has been partially fused by the last-named means. There are many substances which cannot be melted because they are decomposed by the action of heat. Thus, wood and many other organic compounds are decomposed into certain gases, which escape, and into carbon and fixed salts, which are left. Similarly, carbonate of lime (chalk) is decomposed into carbonic acid gas and lime at a temperature below its fusing-point. If, however, we prevent the gas from escaping by confining the carbonate of lime in a hermetically closed gun-barrel, it can be melted at a high furnace-heat.

A table of 'The Order of Fusibility of the Metals' is given by Miller in his *Elements of Chemistry*, 2d edition, vol. ii. p. 294.

FUSIBLE METAL. Fusible metal is composed of 2 parts of bismuth, 1 of lead, and 1 of tin. It fuses at 201° F., becoming pasty before it completely melts. It expands in a very anomalous manner; its bulk increases regularly from 32° to 95°; it then contracts gradually to 131°; it then expands rapidly till it reaches 176°, and from that point till it melts, its expansion is uniform. The faculty of expanding as it cools, while still in a comparatively soft state, renders the alloy very serviceable to the die-sinker, who employs it to test the accuracy of his die, every line being faithfully reproduced in the cast made of the alloy. The proportions of the three metals are sometimes varied, and another formula is given in the table in FUSING AND FREEZING POINTS.

FUSIL (Fr. *fusée*, a spindle) is represented heraldically as longer and more acute than a Lozenge (q. v.).

FUSILIERS were formerly soldiers armed with a lighter fusil or musket than the rest of the army; but at present all regiments of foot carry the Enfield rifle. Fusilier is therefore simply a historical title borne by a few regiments—viz., the Scots Fusilier Guards, the 5th Northumberland, 7th Royal, 21st North British, 23d Welsh, 87th Irish, 101st and 104th Bengal, 102d Madras, and 106th Bombay Fusiliers.

FUSING AND FREEZING POINTS are terms applied to the temperature at which solids assume the liquid form, and liquids become solid. The following table gives some of the best determinations of the fusing-point:

Mercury,	−39°	Alloy (1Sn,2Bi),	286°
Oil of vitriol,	−30°	" (3Sn,2Pb),	383°
Bromine,	9°·5	Tin,	451°
Oil of turpentine,	14°	Bismuth,	512°
Ice,	32°	Nitrate of soda,	591°
Lard,	91°	Lead,	620°
Phosphorus,	111°·5	Nitrate of potash,	642°
Potassium,	136°	Zinc,	773°
Yellow wax,	143°·6	Antimony, (about)	900°
Stearic acid,	158	Silver,	1773°
Sodium,	207°·7	Copper,	1996°
Fusible metal (5Pb,3Sn, 8Bi),	212°	Gold,	2016°
Iodine,	228°·4	Cast iron,	2786°
Sulphur,	239°	Wrought iron, higher than	3280°

We see from this table that alloys may have a fusing-point far below that of any of the metals which enter into their composition. Similarly, mixtures of various silicates fuse at a temperature far below that which is required to melt any one of them, and the same remark applies to mixtures of various chlorides, carbonates, &c.

Most solids, when heated to their fusing-point, change at once into perfect liquids; but some—as, for example, platinum, iron, glass, phosphoric acid, the resins, and many others—pass through an intermediate pasty condition before they attain perfect fluidity, and, in these cases, it is difficult, if not impossible, to determine the exact fusing-point. This intermediate condition is termed *vitreous fusion*, because it is a characteristic property of glass. It is in this intermediate state that glass is worked, and iron and platinum forged.

As a general rule, the freezing-point is the same as the fusing-point—that is to say, if a substance in the liquid form be cooled below the fusing-point, it again becomes solid; but there are cases in which we can cool a liquid several degrees below its fusing-point; thus, by keeping water perfectly still, we can cool it to 5°, or even to 1°·4 before it freezes. If, however, we drop a solid body into water in this condition, or if we shake the vessel containing it, congelation begins at once, and the temperature rises to 32°. This phenomenon is exhibited to a still greater degree in viscid fluids, like the oils. It is well known that the freezing-point of water is depressed by the presence of salts. Thus, sea-water freezes at about 26°·6, and a saturated solution of common salt must be cooled as low as 4° before freezing. Despretz has given the freezing-points of various saline solutions at different degrees of concentration in the fourth volume of the *Comptes Rendus*, p. 435.

FU'STIAN, a cotton fabric having a pile like velvet, but shorter, and which is manufactured in nearly the same manner as velvet—viz., by leaving loops standing upon the face of the fabric, and then cutting them through so as to form upright threads, which are afterwards smoothed by shearing, singeing, and brushing. See VELVET.

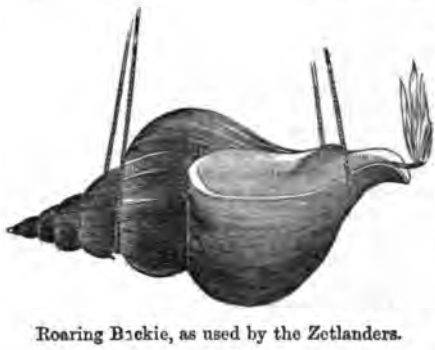
FUSTIC, a name given to two kinds of dye-wood used for producing a yellow colour, and with chemical additions, other colours, such as brown, olive, and green. The name seems to be derived from the French *Fustet*, the name of the Venice Sumach (*Rhus cotinus*, see SUMACH), a shrub found in the

south of Europe; and to have been transferred to a very different plant, the *Maclura tinctoria* of Don, or *Morus tinctoria*, a tree of the natural order *Moraceæ*, a native of the West Indies, Mexico, Brazil, Columbia, &c. The fustic is a large and handsome tree, the wood is of a greenish-yellow colour, and is sometimes used in mosaic cabinet-work and turning, but chiefly in dyeing. About 10,000 tons are imported annually into Britain. The tree is particularly abundant in Campeachy. The wood contains a great quantity of colouring matter, which forms the most durable of vegetable yellow dyes; but as the colour is rather dull, it is more used for producing other colours. The name OLD FUSTIC is sometimes given to it, and YOUNG FUSTIC to the wood of *Rhus cotinus*. These terms began to be employed about the beginning of last century, from the mistaken notion that the one, in small pieces, was the wood of the young tree, and the other, in comparatively large logs, of the same tree in a more mature state.—The OSAGE ORANGE (q. v.) of North America (*Maclura aurantiaca*) is nearly allied to old fustic, and its wood also affords a yellow dye.

OLD FUSTIC, or Yellow Wood, is employed for dyeing woollens yellow, and also to impart to them green and olive colours when mixed with indigo and salts of iron. It furnishes a yellow colouring matter, which may be obtained in crystals by evaporating its watery solution. This substance is termed moritannic acid, and its composition is represented by the formula $C_{26}H_{16}O_{20}$. The bichromates of potash and of lead have to a great degree superseded the use of OLD FUSTIC.

YOUNG FUSTIC is the wood of *Rhus cotinus* or *Venetian sumach*. It contains a yellow colouring matter, to which the name *Fusteric* has been given. It is generally used in combination with other dyes, in order to strike some particular tint.

FUSUS (Lat. a spindle), a genus of gasteropodous molluscs nearly allied to *Murex* (q. v.), having a spindle-shaped shell, with a very elevated spire, the first whorl often much dilated, and a straight elongated canal. The whorls are not crossed by varices, as in *Murex*. The species were formerly, however, included in that genus. About 100 existing species have been described, and more than three times that number of fossil ones. The existing species are distributed over the whole world, living generally on muddy and sandy sea-bottoms at no great depths.



Roaring Buckie, as used by the Zetlanders.

F. antiquus is known in the south of England as the RED WHELK, and in Scotland as the ROARING BUCKIE, from the continuous sound—as of waves breaking on the shore—heard when the empty shell is applied to the ear. In the cottages of Zetland, the shell, generally about six inches long, is used for a lamp, being suspended horizontally by a cord, its cavity containing the oil, and the wick passing through the canal. This mollusc is often dredged up with oysters. It is eaten by the poor, but is more generally used as bait for cod, skates, &c.

This genus makes its first appearance in the Oolite, in which 10 species have been noticed. The numbers increase to 35 in the Cretaceous rocks, to 100 in the Eocene, and to 150 in the Miocene and Pliocene.

FUTA'K, a town of Lower Hungary, in the county of the Lower Bacs, is situated on the left bank of the Danube, in lat. 45° 15′ N., and long. 19° 42′ W. It has a beautiful castle and garden, and the inhabitants grow vegetables and tobacco extensively. F. has a great trade in corn, and has a fair in November, frequented by merchants from Turkey, Greece, and Armenia. Pop. 7800.

FUTEHGU'NGE (in English, *Victory Market*) is the name of two places in Rohilcund, the scenes respectively, as the name implies, of two battles gained by the British over the Rohillas.—1. *Eastern* F., a town of the district of Bareilly, is situated near the right bank of the Bhagal, in lat. 28° 4′ N., and long. 79° 42′ E. The action, from which this spot is designated, was fought in 1774, giving to the Nawáb of Oude, then an ally of the English East India Company, a large part of Rohilcund; and it was, in fact, to commemorate that event, that Eastern F. was built by that prince.—2. *Western* F., a town also of the district of Bareilly, is situated in lat. 28° 28′ N., and long. 79° 24′ E. The conflict that distinguished this locality occurred in 1796. The only eminence in the neighbourhood, the most hotly contested point in the struggle, bears twofold testimony to the story, in the memorials of those who fell—a plain and simple monument of fourteen British officers, and a carved and minareted tomb of two Rohilla chieftains.

FUTTEHPU'R, a town of the Doab, on the great trunk-road between Calcutta and Delhi, stands in lat. 25° 57′ N., and long. 80° 54′ E., 70 miles north-west of Allahabad, and 50 miles to the south-east of Cawnpore. It is a thriving place, with about 16,000 inhabitants. Besides the buildings belonging to the civil establishment of the district of its own name, it contains a small, but very elegant mosque.

FUTTEHPUR, the district of which the town of the preceding article is the capital, lies wholly within the Doab, and occupies its entire breadth from Jumna to Ganges. It extends immediately to the west of the district of Allahabad, in lat. from 25° 25′ to 26° 13′ N., and in long. from 80° 12′ to 81° 23′ E., containing 1583 square miles, and 512,000 inhabitants. It yields large quantities of cotton, and by means of its bordering rivers, and a branch of the Ganges Canal, it possesses considerable facilities for inland navigation.

FUTTUHA, or **FUTWA**, a town of 12,000 inhabitants, in the district of Patna, and sub-presidency of Bengal, stands at the confluence of the Punpun and the Ganges, in lat. 25° 30′ N., and long. 85° 22′ E. As the Ganges is here deemed peculiarly sacred, F. is, at certain seasons of the year, the resort of vast numbers of pilgrims.

FUTTYGU'RH, the military cantonment of Furruckabad, stands about three miles to the east of that city, on the opposite or left bank of the Ganges, being in lat. 27° 22′ N., and long. 79° 41′ E. Its name became peculiarly famous, or rather infamous, in the mutiny of 1857, less, however, for the outbreak that occurred on the spot, than for

uralleled sufferings of the hapless fugitives
romen, and children.

TYPU'R, a town in the district of Saugor
budda, and sub-presidency of the North-
ovinces, stands on the Unjon, a tributary
erbudda, about 20 miles from the point of
being in lat. 22° 38' N., and long. 78° 38' E.
place of some importance, as being the
of three Gond rajahs.

URE DEBT is a debt wherein the obliga-
ay and the time for payment is fixed and
out the day for performance has not arrived.
a debt, it was said in the civil law *dies cedit
tum venerit;* and it was distinguished from
gent debt, i. e., a debt payable on the per-
of a condition which was uncertain, in
was said *dies nec cedit nec venit.* Thus, an
n to pay six months hence is a future debt;
ition to pay 'if my ship returns from Spain,'
gent. In the event of the death or bank-
f a person having large commercial trans-
t is often of great importance that the right
lders of such securities should be accurately
n Rome, on the death or bankruptcy of
, a creditor holding a claim for a future
s entitled to payment, deducting a per-
proportionate to the date at which his debt
able; but a contingent creditor only received
ty for payment in case his debt should
payable. This general principle has been
ed into the legal systems of modern states.
nd and in France, the rights of creditors
laims not immediately payable are based
rule of the civil law. In England, a future
order to found a valid claim, must be in
but it may be constituted by bond, bill, or
other security. By common law, such a
uld not be enforced until the actual time
ent has arrived; and formerly, in case of
cy, a creditor on a debt of this kind was not
to insist in his claim. At the same time,
rupt's discharge was held not to release
n a debt which had not been admitted to
the process; and hence debtors were some-
carcerated for years on debts which they
olly unable to discharge. See IMPRISON-
R DEBT. This state of things was pro-
of manifest injustice on both debtor and
; on the latter, by excluding him from
in his claim at a time when he might have
a partial payment; on the former, by
g him for his default when he was deprived
eans of making any return. The subject
quently discussed in parliament before a
was applied. At last, by 6 Geo. IV. c. 16,
was enacted that, in cases of bankruptcy,
debt was not immediately payable, the
should be entitled to prove his debt, and
receive a dividend, deducting interest at 5 per cent.
for the period which was to elapse before the date
when the debt was payable in due course. By s.
56, debts payable on a contingency might be valued,
and a dividend paid on the estimated value. Similar
provisions were inserted in the 12 and 13 Vict. c.
196, ss. 172 and 177. By the last bankruptcy act,
24 and 25 Vict. c. 134, s. 153, it is enacted that a
person having a claim for unliquidated damages,
which are of the nature of a future debt, may have
his claim assessed by a jury either in the court of
equity, or before a common-law judge, or, in case
of agreement between the parties, by the court
without a jury.

By the common law of Scotland, the rule of the
civil law, as to the rights of creditors having a
future claim, has always been recognised. In the
event of bankruptcy, creditors in both future and
contingent debts are allowed to rank, but the latter
only to the extent of receiving a security until the
condition is purified. But by 19 and 20 Vict. c. 79,
s. 53, which is now the ruling statute as to bank-
ruptcy in Scotland, contingent creditors may have
their debts valued, and may vote in the Sequestra-
tion (q. v.), and draw dividends proportionate to the
valuation. It is also enacted, s. 14, that all creditors
whose debts are not *contingent* may concur in the
petition for bankruptcy. But the Scotch law affords
to future debtors a further privilege, unknown to
the system of the sister-country—viz., that of
arrestment in security, whereby a creditor having a
future claim is enabled, in case his debtor seem to
be wilfully diminishing his means of discharging his
debt, to attach the goods of the debtor as a security
for the payment of his debt. See ARRESTMENT.

FYNE, LOCH, an arm of the sea running north
and north-east from the Sound of Bute, in the south
of Argyleshire, to beyond Inverary, in the north, and
is bounded by the district of Cowal on the E., and
by those of Argyle, Knapdale, and part of Cantire
on the W. It is 43 miles long, 2 to 10 miles broad,
and 40 to 70 fathoms deep. Its shores are deeply
indented, and bordered by low bare hills, which
rise higher and are wooded near Inverary. On the
west side, it sends off a small branch leading to
the Crinan Canal. Loch F. is celebrated for its
herrings.

FYZABA'D, a rapidly decaying city of Oude,
stands on the right bank of the Ghogra, here a
navigable river, in lat. 26° 47' N., and long. 82° 10' E.
Originally an appendage, as it were, of Ayodha or
Oude, the ancient capital from which the country
took its name, F. became, in 1730, itself the seat
of government. But in 1775, immediately after the
annexation of part of Rohilcund (see FUTEHGUNGE),
it was supplanted by Lucknow, which lay about 90
miles to the west, in the direction of the newly
acquired territory.

G

THE seventh letter in the Roman alphabet, and in the modern alphabets derived from it. For the history of the character, see ALPHABET and letter C. The original and proper sound of G (corresponding to Gr. γ) is that heard in *gun*, *give*, *glad*. But the same natural process which turned the *k*-sound of *c* before *e* and *i* into that of *s* (see C), produced a similar change on G, so that before *e* and *i* it came to be pronounced by the Latins like *dzh*. The sibilation of the letter *g* before *i* followed by a vowel, had begun as early as the 4th c. A. D., as is evident from the misspelling in inscriptions; in the case of *c*, the change can be detected much earlier. From the Latin, the *dzh*-sound of *g* passed into the Romanic tongues, and also into English. As a general rule in English, in words derived from the classical and Romanic languages, *g* has the hissing sound before *e*, *i*, and *y*; it has its natural sound in all words before *a*, *o*, and *u*; and it retains it in Teutonic words even before *e* and *i*.

G, in its proper power, belongs to the order of gutturals, *k* or *c*, *g*, *ch*, *gh*; of the two 'bare' gutturals, *g* is the *flat* (or medial), and *k* the *sharp*; while *gh* and *ch* are the corresponding Aspirates (q. v.).

The following are some of the interchanges between *g* and other letters: Lat. *ager*, Gr. *agros*, Eng. *acre*, Ger. *acker*; Gr. *triakonta*, Lat. *triginta*; Gr. *gonu*, Lat. *genu*, Eng. *knee*; Lat. (g)*nosco*, Gr. *gignosco*, Eng. *know*; Lat. *genus*, Eng. *kin*; Gr. *chen*, Ger. *gans*, Eng. *goose* and *gander*; Lat. *hesternus*, Ger. *gestern*, Eng. *yester* (day); Lat. *germanus*, Span. *hermano*. The convertibility of *g* and *y* is seen in the old English participles in *y*, as *yclad*, corresponding to Sax. and Ger. *ge-*; in Ger. *gelb*, Eng. *yellow*; Ger. *tag*, Eng. *day*; Ger. *mag*, Eng. *may*; *yate* for *gate*; *yard* for *garden*, Lat. *hortus*. In Italian, *gi* is substituted for *j*, as *Giulio* for *Julius*; and in French, which has no *w*, that letter is represented by *gu*, as *guerre*, *guarder*, for Eng. *war*, *ward* or *guard*. G has been frequently dropt out, as Lat. *nosco* for *gnosco*; Eng. *enough*, compared with Ger. *genug*; *agone*, with *ge-gangen*; Lat. *magister*, Fr. *maistre* or *maître*, Eng. *master*. *May*, Lat. *Maius*, contracted from *Magius*, is from a root *mag*, or (Sans.) *mah*, to grow: so that May is just the season of growth.

G, in Music, is the fifth sound of the natural diatonic scale of C, and the eighth sound of the chromatic scale. It stands in proportion to C as 2 to 3; is a perfect fifth above C, and the second harmonic arising from C as a fundamental note. In the solmisation of Guido Aretinus, the note G was called Sol, Re, or Ut, according as the hexachord began with C, F, or G. G major as a key has one sharp at its signature, viz., F sharp. G minor has two flats at its signature, viz., B flat and E flat.

GAAL, JOZSEF, a Hungarian author, was born at Nagy Karoly in 1811, studied at the college of Buda, and at the university of Pesth, and entered soon afterwards the administrative career, being attached to the Hungarian Council of Lieutenancy. G. began writing early, and proved equally successful when gossiping in the columns of Kossuth's famous *Pesti Hirlap*, and when engaged in translating a masterpiece of Cervantes, filling the periodicals with tales and novels, or furnishing original works for the National Theatre. The sketches of country-life as it was, and as it still continues on the vast plains of Hungary, are nowhere to be found more vividly and more truly exhibited than in G.'s comedies and tales. The following are some of G.'s original compositions: *Szirmay Ilona*, a novel in 2 vols. (Pesth, 1836); *Peleskei Notarius* (The Notary of Peleske, Pesth, 1838), a comedy in four acts—might be called *the* Hungarian comedy *par excellence*; *Szvatopluk*, a tragedy in five acts. Tales: *Pusztai Kaland* (An Adventure on the Hungarian Prairies); *Tengeri Kaland az Alfoldoen* (Seafaring Adventures in Lower Hungary); *Hortobágyi éjszaka* (A Night on the Heath of Hortobágy). During the sojourn of the Hungarian Diet at Debreczin (1849), G. was editor of a journal combating extreme radical views.

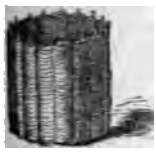
GA'BBRO, the name given by Italian geologists to a variety of greenstone composed of felspar and diallage. It is equivalent to euphotide or diallage rock.

GABELENTZ, HANS CONON VON DER, a distinguished German philologist, was born at Altenburg, 13th October 1807, and educated at the universities of Leipsic and Göttingen. In 1833, he published his *Eléments de la Grammaire Mandchoue*, a new grammar, in which the entire idiomatic character of that language was developed in concise rules. He had, moreover, a share in the establishment of a journal devoted to Oriental science (*Zeitschrift für die Kunde des Morgenlandes*), and contributed to it some interesting papers on the Mongolian language. Along with J. Löbe, he also published a critical edition of the Gothic translation of the Bible by Ulfilas, with a Latin translation, and with a Gothic glossary and grammar appended (Leipsic, 1843—1846). G. was also the first philologist in Germany who undertook a scientific treatment of the dialects of the Finnish-Tartar stem. Besides a Syrjan grammar (*Grundzüge der Syrjänischen Grammatik*, Altenburg, 1841), he furnished contributions to periodicals on the Mordvinian and Samoyed languages. He has since published some contributions to the science of language (*Beiträge zur Sprachenkunde*). The first three parts were issued in 1852, and the first volume of a collective of his Philological Fragments (*Sprachwissenschaftliche Fragmente*) appeared in 1859, and a Dissertation on the Passive Voice (*Ueber das Passivum, Eine Sprachvergleichende Abhandlung*) in 1860.

GABELLE, a French word, derived from the German *Gabe*, gift or tribute, and originally used in

a general way to designate every kind of indirect tax, but more especially the tax upon salt. This impost, first established in 1286, in the reign of Philippe IV., was meant to be only temporary, but was declared perpetual by Charles V. It varied in the different provinces. Those that were most heavily taxed were called *pays de grande gabelle*, and those that were least heavily taxed, *pays de petite gabelle*. It was unpopular from the very first, and the attempt to collect it occasioned frequent disturbances. It was finally suppressed in 1789. The name *gabelous* is, however, still given by the common people in France to tax-gatherers.

GABION (Ital. *gabbia*, related to Lat. *cavea*, hollow), a hollow cylinder of basket-work, employed in field or temporary fortification, and varying in size from a diameter of 20 inches to 6 feet, with a height of from 2 feet 9 inches to 6 feet. In constructing it, stout straight stakes are placed upright in the ground in a circle of the required diameter, and are then wattled together with osiers or green twigs, as in the formation of baskets. The apparatus being raised, when completed, from the ground, the ends are fastened, and the gabion is ready to be rolled to any place where it is desirable to form a breast-work against the enemy. Placed on end, and filled with earth, a single row of gabions is proof, except at the points of junction, against musketry fire, and by increasing the number of rows, any degree of security can be obtained. The gabion has the advantage of being highly portable, from its shape, while with its aid a parapet can be formed with far less earth, and therefore in less time, than in cases when allowance has to be made for the slopes on both sides, which are necessarily present in ordinary earthen walls. The *sap-roller* consists of two concentric gabions, one 4 feet, the other 2 feet 8 inches in diameter, with the space between them wedged full of pickets of hard wood. In sapping (see MINES), these serve as substitutes for mantlets.



Gabion.

Stuffed gabions are gabions rammed full of broken branches and small wood; being light in weight, they are rolled before soldiers in the trenches, and afford some, though not a very efficient, protection against musketry fire.

Gabionnade is a line of gabions thrown up by troops as a defence, after being driven back from other more solid positions. In carrying a well-defended fortress, gabionnade after gabionnade has sometimes to be stormed before the besieged can be compelled to surrender.

GABLE, the triangular part of an exterior wall of a building between the top of the side-walls and the slopes of the roof. The whole wall of which the gable forms the top is called a gable-end; party-walls, or the walls which separate two contiguous houses, and which belong equally to both houses, are called in Scotland 'mutual gables.'

The gable is one of the most common and characteristic features of Gothic architecture. The end walls of classic buildings had *Pediments* (q. v.), which followed the slope of the roofs, but these were always low in pitch. In medieval architecture, gables of every angle are used with the utmost freedom, and when covered with the moulded and crocketed copes of the richer periods of the style, give great variety and beauty of outline.

Gablets, or small gables, are used in great profusion in the more decorative parts of Gothic architecture, such as canopies, pinnacles, &c., where they are introduced in endless variety along with tracery, crockets, and other enrichments.

The towns of the middle ages had almost all the gables of the houses towards the streets, producing great diversity and picturesqueness of effect, as may still be seen in many towns which have been little modernised. The towns of Belgium and Germany especially still retain this medieval arrangement. In the later Gothic and the Renaissance periods, the simple outline of the gable became stepped and broken in the most fantastic manner. See CORBIE STEPS.

In Scottish law, a mutual gable or party-wall, though partly built on the adjoining property, belongs to the builder, and he can prevent his neighbour from availing himself of it for the support of his house, until he has paid half the expense of building it. For the law of England on this subject, see PARTY-WALL.

GABOON RIVER, THE, takes its rise in the Crystal Mountains, a chain in Western Africa, running almost directly east and west, parallel to, and about 80 or 100 miles distant from, the coast. Flowing first in the direction of north to south, it afterwards curves toward the north, and empties itself into the Atlantic in lat. about 0° 30′ N., and long. 9° 10′ E. Its mouth forms a bay of some 10 or 12 miles in length, with a breadth varying from 7 to 15 miles. The total length of the river is said to be about 120 miles. The G. is deep and sluggish, the mass of its waters being tidal; 60 miles from its mouth the tide rises to a height of from seven to nine feet. The climate is unhealthy; but the profits of the trade in ivory, which is obtained abundantly in the territories through which the river flows, induced a French colony to settle and build a fort at the mouth of the river in 1842 or 1843. In the same year, an American mission, which still continues in active operation, was established at Baraka, about eight miles up the river. The Gaboon country, besides ivory—of which, when the home demand is brisk, it yields about 80,000 pounds annually—produces ikar-wood, a dye-wood from which a dark-red dye is obtained, ebony, and copal of inferior quality. The banks of the river, from its source to the ocean, are occupied by about a dozen tribes, chief of which is the Mpongeve, who hold its mouth. This division of territory renders the ivory much more costly than it otherwise would be, the first owners in the interior not being allowed to take it direct to the white trader at the coast, but compelled to transmit it through the hands of the intervening tribes, each of whom makes a profit.

GABRIEL (Heb. the man or mighty one of God) is, in the Jewish angelology, one of the seven archangels. He appears in the book of Daniel as the interpreter of the prophet's vision (chap. viii.), and announces the future appearance of the Messiah (chap. ix. 21—27). In the New Testament, he reveals to Zacharias the birth of John the Baptist (Luke, i. 11), and to the Virgin Mary the birth of Christ (Luke, i. 26). According to the Rabbins, he is the angel of death for the people of Israel, whose souls are intrusted to his care. The Talmud describes him as the prince of fire, and as the spirit who presides over the thunder and the ripening of fruits. When Nebuchadnezzar besieged Jerusalem, G. is believed to have entered the Temple, by command of Jehovah, before the Assyrian soldiery, and burned it, thereby frustrating their impious intentions. G. has also the reputation among the Rabbins of being a most distinguished linguist, having taught Joseph the 70 languages spoken at Babel, and being, in addition, the only angel who could speak Chaldee and Syriac. The

Mohammedans hold G. in even greater reverence than the Jews, and regard him as the chief of the four most favoured angels who form the council of God, he is called the spirit of truth, and is believed to have dictated the Koran to Mohammed.

GACHARD, Louis Prosper, principal archivist of Belgium, was born in France about the year 1800. He was originally a compositor; but having removed to Belgium, he took part in the revolution of 1830, and was naturalised in 1831. In the same year he was appointed to the useful and honourable post which he still retains (1862). G. has spent much time in examining the documents relating to Belgian history, which are to be found in the national archives and in those of Spain. His principal writings are, *Analectes Belgiques* (1830); *Documents Politiques et Diplomatiques sur la Révolution Belge de* 1790 (1834); *Mémoires sur les Bollandistes et leurs Travaux depuis* 1773 *jusqu'en* 1789 (1847); *Correspondance de Guillaume le Taciturne* (1847—1851); *Correspondance de Philippe II., sur les Affaires des Pays-Bas* (1848—1851); *Correspondance du Duc d'Albe sur l'Invasion du Comte Louis de Nassau en Frise* (1850); *Retraite et Mort de Charles-Quint* (1854), and *Relation des Troubles de Gand sous Charles-Quint* (1856). Prescott, the American historian, speaks highly of G., and of the importance of his labours in regard to the history and character of the Emperor Charles V. See Prescott's edition of Robertson's *History of Charles V.* (Boston, 1857). Recently (1859), G. published a series of historical documents bearing unfavourably upon the characters of Counts Egmont and Horn, which had the effect of stopping proceedings in regard to the erection of a national monument to these two noblemen.

GAD, the first-born of Zilpah, Leah's maid, was the seventh son of Jacob. His name is differently explained.—The *tribe* of Gad numbered in the wilderness of Sinai more than 40,000 fighting-men. Nomadic by nature, and possessing large herds of cattle, they preferred to remain on the east side of Jordan, and were reluctantly allowed to do so by Joshua, on condition of assisting their countrymen in the conquest and subjugation of Canaan. Their territory lay to the north of that of Reuben, and comprised the mountainous district known as Gilead, through which flowed the brook Jabbok, touching the Sea of Galilee at its northern extremity, and reaching as far east as Rabbath-Ammon. The men of Gad—if we may judge from the eleven warriors who joined David in his extremity—were a race of stalwart heroes; 'men of might, and men of war fit for the battle, that could handle shield and buckler, whose faces were like the faces of lions, and were as swift as the roes upon the mountains' (1 Chron. xii. 8). Jephthah the Gileadite, Barzillai, Elijah the Tishbite, and Gad '*the* seer,' were also in all probability members of this tribe.

GADA'MES, or more accurately GHADAMES (the *Cydamus* of the Romans), the name of an oasis and town of Africa, the centre of divergent routes to Tunis, Tripoli, Ghat, and Tidikelt, is situated on the northern border of the Sahara, in lat. 30° 9′ N., long. 9° 17′ E., on the south-western boundary of the pashalic of Tripoli, and 310 miles south-west of the town of that name. It contains six mosques and seven schools; but the education offered to the young is limited to the reading of the Koran and a little Arabic writing. The gardens of G. grow dates, barley, wheat, millet, &c., and are watered by the hot spring (89° Fah.), from which the town had its origin. The climate is dry and healthy, though very hot in summer. The revenue of G., estimated at 10,000 mahboobs (£1700), is derived from annual tributes levied on property, and from custom dues and tolls. It is an important entrepôt for manufactures and foreign goods from Tripoli to the interior, and for exports of ivory, bees-wax, hides, ostrich-feathers, gold, &c., from the interior to Tripoli. Previous to 1856, about 500 slaves, principally females, were annually imported at G.; but in that year a decree was issued by the sultan, peremptorily forbidding the traffic, which accordingly has been completely abolished. Pop. 4000, who are devoted Mohammedans.

GAD-FLY. See Bot and Tabanus.

GA'DIDÆ, an important family of malacopterous fishes, having a moderately elongated body covered with small soft scales, the head naked, the fins all soft and destitute of spines, the ventral fins placed under the throat and pointed, one dorsal fin or more, the air-bladder large. Some of the species are small, but others attain a large size. To this family belong the Cod, Ling, Hake, Dorse, Haddock, Whiting, Coal-fish, Burbot, &c. The species are widely distributed. Most of them are marine. A few, as the Burbot, are fresh-water fishes. The more important species are separately noticed.

GA'DWALL (*Anas strepera*, or *Chauliodus strepera*), a species of duck, not quite so large as the mallard, a rare visitant of Britain, but abundant in many parts of the continent of Europe, and equally so in Asia and in North America. It is also found in the north of Africa. Being a bird of passage, it is a native both of arctic and of tropical regions. The

Gadwall (*Anas strepera*).

G. breeds in marshes, and lays from seven to nine eggs. Except at the breeding season, it is usually seen in small flocks, and an individual is sometimes to be found in a flock of other ducks. Its voice is loud and harsh. It is much esteemed for the table, and is common in the London market, being imported chiefly from Holland.

GÆA, or GE, according to the Greek mythology, the goddess of the earth, appears in Hesiod as the first-born of Chaos, and the mother of Uranus, Pontus, and many other gods and titans. As the vapours which were supposed to produce divine inspiration rose from the earth, it was natural that G. should be regarded as an oracular divinity; and, in fact, the oracles at Delphi and Olympia were believed to have belonged to her in the earlier ages of their history. Her worship extended over all Greece, and she had temples or altars in most of the important cities. At Rome, G. was worshipped under the name of *Tellus*.

GAELIC LANGUAGE AND LITERATURE. The term Gaelic (Gwyddelian or Gadhelic) is used in two senses. In its wider signification, it designates

thern branch of the Celtic languages, ending the Irish, the Highland-Scottish, Manx. See CELTIC NATIONS and IRISH GE AND LITERATURE. In its narrower signi- it designates the Highland-Scottish dialect, wn by the name of Erse or Irish. Mr W. e, one of the latest and best informed on the subject, holds that the differences the language spoken by the Scotch High- and the language spoken by the native Irish 'partly in the *pronunciation*, where the tion of the language is different, where that change in the initial consonant, produced nfluence of the previous word, and termed Irish grammarians eclipsis, is unknown n the sibilant, where the vowel sounds are , and there are even traces of a consonantal tion; (2) partly in the *grammar*, where the Gaelic prefers the analytic form of the id has no present tense, the old present ow used for the future, and the present by the auxiliary verb, where the plural of of the nouns is formed in a peculiar man- embling the Anglo-Saxon, and a different is used; (3) partly in the *idioms* of the , where a greater preference is shewn to the idea by the use of substantives, and the anxiously avoided; and (4) in the *vocabulary*, aries to a considerable extent, where words olete in Irish are still living words, and re used in a different sense.'—*The Dean of 's Book*, introd. pp. xiv. xv. (Edin. 1862).

rigin of the differences thus described is ion still in dispute. Mr Skene contends y are ancient, and enter into the organisa- the language. The Irish scholars, on the nd, hold that they are comparatively modern mportant, and little more than provincial ons of the mother-language of Ireland. The Richard Garnett, one of the most learned sh philologists, is on the Irish side, holding ish is the parent tongue, that Scottish s Irish stripped of a few inflections, and anx is merely Gaelic with a few peculiar nd disguised by a corrupt system of ortho- ' and, again, that the language of the Highlands 'does not differ in any essential om that of the opposite coast of Leinster ter, bearing, in fact, a closer resemblance w German does to High German, or Danish lish.'—*Philological Essays*, pp. 202, 204 859). That the north of Ireland, and the Highlands and West Islands, were, at an riod, peopled by the same race, or races, is l on both sides. Mr Skene further admits, m about the middle of the 12th c. to about lle of the 16th c., Ireland exercised a l literary influence on the Scottish High- that the Irish sennachies and bards were f a school which included the West High- that the Highland sennachies were either descent, or, if they were of native origin, to bardic schools in Ireland for instruction language and the accomplishments of their at in this way the language and literature Scottish Highlands must have become, by more and more assimilated to the language rature of Ireland; and that it may well oted whether, towards the middle of the there existed in the Scottish Highlands ans of acquiring the art of writing the e except in Ireland, or the conception of a and cultivated literature, which was not d with the language and learning of that Mr Skene holds, at the same time, that a lar Gaelic, preserving many of the independent features of a native language, existed among the Scottish Highlanders as a spoken dialect; and that a popular and unwritten literature existed in that native and idiomatic Gaelic, in the poetry handed down by tradition, or composed by native bards innocent of all extraneous education in the written language of Ireland.

The first books printed for the use of the Scottish Highlanders were a translation of Knox's Prayer Book in 1567, by John Carswell, Bishop of the Isles; a translation of Calvin's Catechism, in 1631; a translation of the Psalms of David, begun in 1659, and completed in 1694; and a translation of the Bible, published by the Rev. Robert Kirke, minister of Balquhidder, in 1690. All these works are in the Irish orthography and Irish dialect; the last-mentioned work, indeed, is nothing more than a reprint of Bishop Bedell's Irish version of the Bible, with a short vocabulary of Scottish Gaelic words, to adapt it to the use of the Scottish Highlanders.

The first translations into the Scottish Gaelic were of Baxter's *Call to the Unconverted*, published in 1750; of the Psalms of David, in 1753, in 1787, and in 1807; of the New Testament, in 1767 and 1796; of Alleine's *Alarm*, in 1781; of the Old Testament, in 1783—1787, and in 1820; and of the Old and New Testaments, in 1826.

Vocabularies of the Scottish Gaelic were published in 1690, in 1702, in 1741, in 1795, and in 1815. The first Dictionary, by R. A. Armstrong, appeared in 1825; the largest and best was published under the auspices of the Highland Society of Scotland, in two quartos, in 1828. The best grammar is that of the Rev. Alexander Stewart, minister at Dingwall, published in 1801, and reprinted in 1812.

The oldest written poetry in the Scottish Gaelic is preserved in *The Dean of Lismore's Book*, written between 1511 and 1551, by Sir James Macgregor, vicar of Fortingall, and Dean of Lismore. It is now in the Advocates' Library at Edinburgh. Selections from it have been published at Edinburgh during the present year (1862), with translations by the Rev. Thomas M'Lauchlan, as well into English as into modern Scottish Gaelic, and with a preliminary dissertation by Mr W. F. Skene. The volume contains nine pieces ascribed to 'Ossian, the son of Finn,' who speaks of himself as contemporary with St Patrick, and pieces by later and less known writers, including a few of knightly or noble rank, such as Gerald Fitzgerald, fourth Earl of Desmond, in Ireland; Isabella Campbell, wife of the first Earl of Argyle; and 'Duncan MacCailein, the Good Knight,' believed to be Sir Duncan Campbell of Glenurchy. The literary merit of the compositions is very slender.

The bibliography of the scanty literature of the Scottish Gaelic will be found in Reid's *Bibliotheca Scoto-Celtica* (Glasg. 1832). The modern names of most note are those of Robert Calder Mackay, or Robb Donn, as he is more commonly called in his native Sutherland, whose poems were published at Inverness in 1829; and Duncan Ban McIntyre, of Glenorchy, whose poems were published at Glasgow in 1834. The former was born in 1714, the latter in 1724; both were self-educated. The traditional prose literature has been collected and illustrated by Mr J. F. Campbell of Islay, in three pleasing volumes, *Popular Tales of the West Highlands* (Edin. 1860—1862).

Mr Skene has very clearly and fairly stated the long-disputed question as to the authenticity of the famous Poems of Ossian, published first in English, and afterwards in Gaelic, by Mr James Macpherson. The conclusions arrived at are: 1. That the characters introduced into Macpherson's poems were not invented by him, but were really the subjects

of tradition in the Highlands; and that poems certainly existed which might be called Ossianic, as relating to the persons and events of that mythic age. 2. That such poems, though usually either entire poems of no very great length, or fragments, had been handed down from an unknown period by oral recitation, and that there existed many persons in the Highlands who could repeat them. 3. That such poems had likewise been committed to writing, and were to be found to some extent in manuscripts. 4. That Macpherson had used many such poems in his work; but by joining separated pieces together, and by adding a connecting narrative of his own, had woven them into longer poems, and into the so-called epics.

The Scottish Gaelic speech is everywhere gradually, and in some places rapidly, losing ground; but it is still used, wholly or partially, in the public religious services of about 180 out of about 1000 congregations of the Church of Scotland.

GAETA (the Cajeta of the Latins), a strongly fortified maritime town of the Neapolitan province Terra di Lavoro, is picturesquely situated on an abrupt promontory projecting into the Mediterranean, and connected with the mainland by a low and narrow isthmus protected by solid walls. On the summit of the promontory stands the circular tower D'Orlando, said to be the ancient mausoleum of Lucius Munatius Plancus, the friend of Augustus. The beauty of the bay of G., which almost rivals that of Naples, has been celebrated by Homer, Virgil, and Horace. Cajeta, the ancient name of G. derives its origin, according to Virgil, from its being the burial-place of Cajeta, the nurse of Æneas. On the dismemberment of the Roman empire, G. became a centre of civilisation and commercial prosperity, and reached still further importance after the decadence of the eastern empire. In the growth of this early municipality is foreshadowed the commercial life and grandeur of the later Italian republics. Both in ancient and modern times, G. has sustained remarkable sieges, and recently it has been the theatre of several interesting events. In 1848, it became the refuge of Pope Pius IX., when the revolution at Rome compelled him to retire. In 1860, after the defeat of the Neapolitans on the Volturno by the forces of Garibaldi, G. was the last stronghold of the Bourbon dynasty of Naples, and surrendered after a protracted siege to General Cialdini. Many interesting classic remains have been found in G., including a fine marble vase by the Athenian sculptor Salpione. Its vicinity abounds in remains of Roman villas, &c. The citadel, which is of great strength, contains in its tower the tomb of the Constable Bourbon, killed at the taking of Rome in 1527. The inhabitants of G., who number about 15,000, derive their chief profits from the fisheries and their coasting-trade in oil, wine, and fruit—the chief productions of the surrounding country.

GÆTU'LIA, an ancient country of Africa, situated south of Mauritania and Numidia, and embracing the western part of the desert of Sahara. Its inhabitants belonged to the great aboriginal Berber family of North and North-western Africa; they were not in general black, though a portion of them dwelling in the extreme south, towards the Niger, had approximated to this colour through intermixture with the natives and climatic causes, and were called *Melanogætuli*, or 'Black Gætulians' (see Ptol. iv. 6, s. 16). The Gætulians were savage and warlike. They came into collision with the Romans for the first time during the Jugurthine war, when they served as light-horse in the army of the Numidian king. Cornelius Cossus Lentulus led a force against them, and for his success obtained a triumph and the surname of Gætulicus (6 A. D.). The ancient Gætulians are believed to be represented in modern times by the Tuaricks or Tawáreks.

GAFF, in a ship or boat, the spar to which the head of a fore-and-aft sail is bent, such sail having its foremost side made fast by rings to the mast, and its lower edge, in most instances, held straight by a boom. The thick end of the gaff is constructed with 'jaws' to pass half round the mast, the other half being enclosed by a rope; this serves to keep it close when the sail is hoisted or lowered. A gaff,

A, Gaff; B, Gaff-topsail-yard; C, Boom; D, Sheet; E, Gaff-topsail.

with the sail called 'driver' or 'spanker,' and the gaff-topsail, which is a small sail carried on the topmast above the gaff, are shewn in the accompanying illustration.

GAFFLES, a name applied to the levers by means of which cross-bows were bent.

GAGE, Thomas, an English general, who became governor of Montreal in 1760, and in 1763 succeeded general (afterwards Lord) Amherst as commander-in-chief of the British army in America. In 1774, when the difficulties between the colonies and Great Britain had already become very serious, General G. was appointed governor of Massachusetts. In peaceful times, his administration might in all probability have been popular and successful; but he was unequal to the exigencies of that trying period. It may indeed be doubted whether any one, whatever his abilities, could, while restricted to the rigorous policy of the home government, have succeeded in preserving the colony to the English crown. In April 1775, General G. sent an expedition to seize the military stores at Concord, and thus provoked the battle of Lexington, the first explosion of the American revolution. Soon after (May 5) the provincial congress resolved that 'no obedience was in future due to him [Gage], and that he ought to be guarded against as an unnatural and inveterate enemy.' According to Bancroft, 'Gage was neither fit to reconcile nor to subdue.' He was recalled, and sailed for England in the autumn of 1775. He died in 1787.

GAGE (Lat. *vadium* or *vadium*) signifies a pawn or pledge, and is derived, says Cowel, from the French *gager*. Hence, by changing *g* into *w*, we have *wage* and *wager;* as 'wager of law,' 'wager of battle,' wherein a person gave his pledge that he would sustain his affirmation; and, in the latter case, the glove was sent as a material pledge to

redeemed by mortal combat. Hence also in ıgland

Estate in Gage, which was of two kinds—*vivum lium*, and *mortuum vadium*. See MORTGAGE. *vum vadium* was where an estate in lands was ven in security of a debt, on condition that the ate should remain with the lender until he had de good the sum lent out of the profits of the id. So as in this case neither money nor land th or is lost, and therefore it is called *vivum lium* (Co. Litt. 205 a). This mode of giving urity has long gone out of use; yet there is no ubt that it was the original method in observance fore the transaction assumed the form of a mort-ge. It exactly corresponds with the Scotch form a pure Wadset (q. v.).

GAGE, or GAUGE, an apparatus for measuring y special force or dimension; thus we have *sure-gage*, *wind-gage* (see ANEMOMETER), *rain-ge* (q. v.), *wire-gage*, *button-gage*, &c. The simplest m of gage of dimension is the common *wire-ge*, by which the diameter of wire is measured. is simply an oblong plate of steel, with notches different widths cut upon the edge; these are mbered, and the size of the wire is determined trying it in the different notches until the e is found which it exactly fits. The thickness sheet-metal is tried by the same gage. There a great want of uniformity in these gages—the rmingham gage for iron-wire, sheet-iron, and el differing from that used for brass, silver, gold, .; and these again from the Lancashire gages. has been proposed, in order to obtain uniformity, l to enable definite descriptions and orders to given with accuracy and certainty, that instead the arbitrary numbers of varying signification w in use, decimal parts of an inch, tenths, hun-dths, thousandths, or still smaller fractions, if essary, be used, and that these be used for all ameters and thicknesses, such as wires, sheet-tals, buttons, watch-glasses, &c.; but such a scale s not yet come into general use. The gage com-only used for buttons, watch-glasses, and such like ge diameters, is a rule with a groove cut length-se down the middle. Another metal rule, with a ass head, slides in this, and by means of a thumb-e, may be pushed out at pleasure. The object to measured is placed between *a* and *b* (fig. 1), and e width of this space is measured by graduations the middle metal slide.

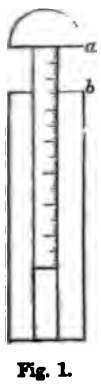


Fig. 1.

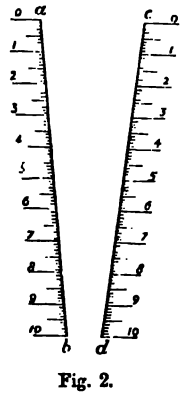

Fig. 2.

A very elegant and delicate gage has recently come to use for measuring watch-glasses, and is applicable many other purposes. On an oblong piece of set-metal, two straight metal ridges are fixed in ch a manner that they shall be inclined at a given angle to each other, as *ab* and *cd* (fig. 2). Now, let us suppose the angle to be such that the distance between *a* and *c* is 2 inches, and that between *b* and *d* is 1 inch, while the lengths *ab* and *cd* are 10 inches. It is evident that for every inch of descent from *a* and *c* towards *b* and *d*, there will be a narrowing equal to $\frac{1}{10}$ of an inch; and for every tenth of an inch of such descent, there will be a narrowing of $\frac{1}{100}$ of an inch, and so on: thus we may, by graduating downwards from *ac* to *bd*, measure tenths by units, hundredths by tenths, and so on to still finer quantities if required. This is applicable to lengths as well as diameters. By means of fine screws with large graduated heads, Messrs Whitworth have measured small pieces of steel to the one-millionth of an inch (see MICROMETER). Pressure-gages, wind-gages, &c. will be treated under the special subjects.—In railways, the gauge means the distance between the rails. See RAILWAY.

GAGERN, HEINRICH WILHELM AUGUST, FREIHERR VON, was born at Baireuth, 20th August 1799, and educated at the military school of Munich. On Napoleon's return from Elba, G. entered the army of Nassau, and served as lieutenant at Waterloo. After the peace, he devoted himself to the study of law at the universities of Heidelberg, Göttingen, Jena, and Geneva. On returning home in 1821, he entered political life under the government of Grand-ducal Hesse, and after passing through several public offices, was elected a member of the Second Chamber in 1832, in which position he vigorously opposed the politics of the governments and of the Federal Diet. In 1835, the government succeeded in obtaining a majority, but G. continued to be re-elected; until, at the close of the following year, seeing the fruitlessness of his opposition to the governmental politics, he declined re-election, and took a lease of his father's estate at Monsheim, with a view to the practical study of agriculture. In 1846, G. again appeared before the public in a work against the government of electoral Hesse, which had been legislating in defiance of the constitution of the electorate. In the following year, he was elected into the Chamber again as representative of Worms, and his return to public life gave such a fresh impulse to liberal politics, that in 1848 the elections returned more opponents of the government than they had done since 1832. The life of G. became now inseparably connected with the memorable German movement of 1848. He took the lead on 27th February, by introducing a motion into the Chamber to promote the representation of the German people in the Frankfort Diet. When the preparatory convention of delegates (*das Vorparlament*) from the German states assembled at Frankfort on 31st March, G. took the most prominent part in its deliberations, and on the meeting of the parliament (28th May) (see GERMANY), he was appointed president, and continued to be re-elected every month till he was called to the perpetual presidency. Displaying more of the qualifications of a practical statesman than were possessed by most of the leading men who joined in this movement, G. struggled on amid all the divisions into which his party separated, and all the difficulties presented by the governments. But unable, on the one hand, to sympathise with the violence of the democratic party, and, on the other, to come to an understanding with the governments, he abandoned the movement altogether on the 20th May 1849. In 1850 he served as major in the Slesvig-Holstein war, and when the campaign was over, retired to the Monsheim estate, which had now come into his possession by his father's death. In 1852 he sold

his estate, and removed with his family to Heidelberg, where he has since resided.

GAGING, or GAUGING. When this term is used without qualification, it refers specially to the gaging of the contents of casks; and in many places, the popular name for the excise officer who measures the contents of casks containing excisable liquors is 'gauger.' Sliding scales, which are graduated according to the mathematical rules for determining the solid contents of regular solids approximating to the form of the casks, are used, but considerable practice and skill are required to apply them with accuracy.

GAILLAC, a town of France, in the department of Tarn, and on the right bank of the river of that name, is situated in a fertile vine-growing district, 32 miles north-east of Toulouse. It is ill built, and has no public building of any importance except the communal college. Distilling, tanning, ship-building, and a brisk trade in wine and brandy are carried on. Pop. (1857) 5503.

GAILLARD, GABRIEL HENRI, a French historian, was born at the village of Ostel, near Soissons, 26th March 1726. He was educated for the bar, but soon abandoned it for literature, and afterwards turned his attention exclusively to history. His first work was entitled *Essai de Rhétorique Française à l'Usage des jeunes Démoiselles*, &c. (1745), and the favourable reception which it met with induced him to publish his *Poétique Française à l'Usage des Dames*. In 1757 appeared his *Histoire de Marie de Bourgogne, Fille de Charles le Téméraire;* which was followed, in 1766, by the *Histoire de François I.*, and in 1782 by the *Histoire de Charlemagne, précédée de Considérations sur la première Race, suivie de Considérations sur la seconde Race, et contenant l'Eloge du Premier President de Lamoignon.* In a diffuse, one-sided, and rhetorical style, he represented the relations of France to England and Spain in his *Histoire de la Rivalité de la France et de l'Angleterre* (1771—1777) (which procured his admission into the French Academy), and *Histoire de la Rivalité de la France et de l'Espagne.* G. was the author of many other works. He wrote *éloges* on Malesherbes (his intimate friend), Descartes, Charles V., Henry IV., Corneille, Molière, &c. He died 13th February 1806.

GAINSBOROUGH, a market-town and seaport of England, in the county of Lincoln, is situated on the right bank of the Trent, about 20 miles above the embouchure of that river in the Humber mouth, and 16 miles north-west of Lincoln. It is a well-built town, consisting mainly of one long street, running parallel with the river, which is here spanned by a fine stone bridge of three elliptical arches. It was constituted a port in 1841. The most interesting of the buildings of G. is that called the Old Hall, a curious structure composed of oak timber framing, and forming three sides of a quadrangle. It is said to have been occupied, or held in property, by the several lords of the manor of G. ever since the Saxons established themselves in this neighbourhood. Among the other public buildings are the parish church—which, with the exception of a fine old tower, dating from the 12th c., was rebuilt in 1736, and the town-hall. There are also a grammar school, established in 1589, and other educational institutions; a literary institute, and several libraries. G. is favourably situated in a commercial point of view, vessels of 200 tons being able to reach its wharfs by the river, while by means of the Keadby, the Chesterfield, and other canals, it maintains communication with the interior of the country. In 1860, 530 vessels of 25,801 tons entered and cleared this port. G. has important manufactures of linseed oil, and carries on malting, rope-making, and ship-building extensively. Pop. (1861) of parl. borough, 6202; of township, 7700.

GAINSBOROUGH, THOMAS, one of the most eminent English landscape-painters, was born at Sudbury, in the county of Suffolk, 1727, and early displayed a decided talent for painting. 'Nature,' it has been said, 'was his teacher, and the woods his academy, where he would pass his mornings alone, making sketches of an old tree, a marsh, brook, a few cattle, a shepherd and his flock, or any other objects that casually came in view.' At 14 years of age, he was sent to London, where he was for some time with Mr Gravelot, the engraver, and afterwards with Hayman. At 19, he married, and set up in Bath as a portrait-painter, in which capacity he was very successful; but his genius first found adequate expression in the delineation of the rich and quiet scenery of his native country, and to this he mainly devoted himself after leaving Bath for London, in 1774. On the institution of the Royal Academy, G. was chosen one of the first members, but never took much interest in its proceedings. He died August 2, 1788, of a cancer in the neck. His last words exhibited more the enthusiasm of the painter than the logic of the theologian: 'We are all going to heaven, and Vandyck is of the party.' G.'s portraits are remarkable as 'striking likenesses,' but are not carefully finished. The best are those of the Royal Family, of Abel the composer, and Quin the actor. His fame, however, rests chiefly on his landscapes; in these, he shews himself a faithful adherent to nature, as he knew it in his own beautiful island. He is, in fact, to be regarded as the first truly original English painter, and, in the opinion of Sir Joshua Reynolds, fit to be the head of an English school. Among his finest productions are, 'The Shepherd's Boy,' 'The Fight between Little Boys and Dogs,' 'The Seashore,' and 'The Woodman in the Storm.' His most celebrated picture is 'The Blue Boy,' in the Devonshire Gallery.

GAIUS, a Roman jurist, most probably of the age of the Antonines, and the chief source of our knowledge of Roman law prior to Justinian. Considering the important place which he holds in ancient legal literature, it is strange that his personal history should be almost entirely unknown, and that almost every circumstance connected with him should be a subject of controversy. The discussion as to whether the name is properly *Gaius* or *Caius* is a mere verbal dispute; but the questions regarding his country, his condition, and even his religion, have been canvassed at considerable length. From his being uniformly called by the single appellation G., it has been inferred that he was either a foreigner or a freedman: from his familiarity with the Greek language, some have argued that he was of Greek origin; from his being cited as 'our' G. by Justinian, who was a native of Illyricum, it is argued by some that G. must have been an Illyrian by birth; while others, arguing from the same fact, and from other equally inconclusive data, have even set him down as a Christian. That the last inference is a false one, cannot admit of a moment's doubt; the others, even if it were possible to settle them definitively, are of no practical importance. As to the precise age of G., thus much is certain, that before the revision of the Roman laws, and the reform of the legal studies by Justinian, the *Institutions* of G., as well as four other of his treatises, were the received text-books of the schools of law. His *Institutions*, moreover, formed the groundwork of the *Institutions* of Justinian. From his being thus preferred to Ulpian or Papinian, it is not to be

inferred that he lived after them, but only that his work was more popular. The latest jurist whom he cites is Salvius Julianus, who lived under Hadrian, and the latest imperial edict is one of Antoninus Pius, whence it may fairly be concluded that he survived Antoninus, and probably wrote under his successor.

The works of G. were largely used in the compilation of the *Digest*, which contains no fewer than 535 extracts from his writings. The principal are, the *Edictum Provinciale*, in thirty-two books; the *Aurea*, in seven; the *Edictum Urbicum; On Trusts; On Mortgages;* and, above all, the *Institutiones*, in four books. The last-named work is that by which G. is chiefly known, and it was probably the earliest complete and systematic textbook of Roman law. Although it was the basis of Justinian's Institutions, both as to its matter and its division, yet it was completely superseded by that work, and after a time was entirely lost, the only knowledge of it which remained being that which was gathered from the detached extracts in the *Digest*, and from the *Breviarium Alaricianum*, or code of the Visigoths, which was known to be derived from it. The recovery of this long lost work, therefore, would in any circumstances be considered a fortunate event; but the *Institutions* of G. draw additional interest from the remarkable manner in which it has been restored to literature. It had long been known that the MSS. in the library of the chapter of Verona were specially curious in the matter of jurisprudence; and in 1816, Niebuhr, while on his way to Rome, discovered, in a palimpsest MS., the later writing of which was a copy of St Jerome's epistles, portions of the work of some ancient jurisconsult, the value of which he at once recognised, and the specimen page of which, as copied by him, was soon afterwards pronounced by Savigny to be a portion of the *Institutions* of Gaius. On the publication of his report, the Berlin Academy of Sciences commissioned two German scholars, Göschen and Hollweg, in 1817, to make a copy of the entire palimpsest, which consists of 127 sheets. It was a work of immense labour. The original writing had been very carefully washed, and in many pages scraped out; the lines of the second writing did not cross the original, as often happens in palimpsests, but ran in the same direction, and frequently over it; while 63 pages of the palimpsest had actually been written three times, G. having been erased to make room for a theological treatise, which in its turn was scraped out to make room for St Jerome! It reflects no small credit on the skill and patience of the copyists that they succeeded in recovering so much as nine-tenths of the entire work, which was published in 1821 by Göschen, and again, after a fresh collation of the MS. by Blume, in 1824; a third and much improved edition, by Lachmann, appeared in 1842. A comparative edition of the *Institutions* of G. and of Justinian, by Klenze and Böcking, had appeared at Berlin in 1829.

The *Institutions* of G. are divided into four books, of which the first is devoted to the law of persons, the second and third to the law of things, and the fourth to the law of actions. The first book was translated into German in 1824 by Von Brockdorff, and the entire work has been translated into French three several times—by Baulet in 1826, by Domenget in 1843, and by Pellat in 1844. In England, it has attracted but little notice, except in a few of the critical journals, and there chiefly as a literary curiosity; nor has any English translation of the work hitherto appeared.

The *Lex Romana Wisigothorum*, or *Breviarium Alaricianum*, is in substance a recast of the *Institutiones* of G., published in 506 by Alaric for the use of the Roman subjects of the west Gothic kingdom. It is chiefly curious as illustrating the analogies and the discrepancies of Roman and barbarian law, and as supplying the germ of many of the medieval institutions by which Roman practice was supplanted. See, in addition to the editions of the *Institutions* enumerated above, Huschke, *Zur Kritik und Interpretation von Gaius Institutionen*, in his *Studien des Römischen Rechts;* also Mackeldey's *Lehrbuch des Römischen Rechts;* and Savigny, *System des heutigen Röm. Rechts.*

GALA WATER, a small river of Scotland, 21 miles in length, rises among the Moorfoot Hills in Edinburghshire, flows in a south-south-east direction through a beautiful and romantic country, and, forming in the lower portion of its course the boundary between Selkirk and Roxburgh shires, unites with the Tweed near Abbotsford.

GALA'CTIC CIRCLE (see GALAXY). This circle is to sidereal what the invariable ecliptic is to planetary astronomy, the ground plane of the sidereal system.

GALACTODENDRON. See COW-TREE.

GALACTO'METER, or LACTOMETER, a very simple instrument for testing the richness of milk; it consists of a glass-tube, graduated to 100 parts. New milk is poured in up to the top of the graduated part, and allowed to stand; and when the cream has completely separated, the value of its quantity is shewn by the number of parts in the 100 which it occupies. Another form of instrument was invented by Döeffel, consisting of a small hydrometer with a scale two inches long divided into 20 degrees, the zero being placed at the point which the instrument sinks in water, and the 20th degree corresponding with the density 1·0383. This instrument is preferred by the continental chemists; and 14° is held to shew milk undiluted with water.

GALACZ, an important town of Moldavia, and the only port of the province, is situated on the left bank of the Danube, about three miles below the confluence of the Sereth with that river. Though it has better houses than most Moldavian towns, it cannot be said to be well built. It has numerous churches, a large bazaar, always well filled with merchandise, and a great number of storehouses for grain and other produce. It was made a free port in 1834, and is the chief entrepôt for the commerce carried on between Germany and Constantinople. Steamers passing G. ply regularly between Vienna and Constantinople, and vessels of 300 tons come close up to the town. The principal articles of export are maize, wheat, rye, tallow, wool, masts and spars, timber, and preserved meat; and the imports are chiefly British manufactures and twist, sugar, raisins, and figs, oil, coal, iron, and tobacco. In 1858, 494 laden vessels cleared at the port of Galacz. The value of the imports and exports for 1852—1855 inclusive was as follows:

Years.	Imports.	Exports.
1852,	£441,7.9	£.7 1.0
1853,	559,440	542,080
1854,	121,440	144,280
1855,	624,880	1,174,260

Several British commercial houses have been established in Galacz. Pop. 40,000.

GALA'GO (*Galago* or *Otolicnus*), a genus of mammalia of the Lemur family, remarkable for the great length of the hind-legs and the great size of the ears, which are membranous, and capable of being folded down as in bats. The head is rounded, the muzzle short, the eyes very large; all the feet have five toes; all the nails are flat, except those of

the first digits of the hind feet, which are armed with sharp claws; the tail is very long, and almost bushy. The species are natives of Africa and Madagascar, varying from the size of a rabbit to that of a rat, more or less nocturnal in their habits, very lively and active, feeding partly on fruits and partly on insects; one of them (*G. Senegalensis*) is known in Senegal as the *gum animal*, from living much in acacias, and feeding, or being supposed to feed, on their gum. 'These pretty animals have all

Galago Monoli (from Routledge's *Natural History*).

the activity of birds, leaping from bough to bough. They watch insects flitting among the leaves, listen to the fluttering of the moth as it darts through the air, lie in wait for it, and spring with the rapidity of an arrow, seldom missing their prize, which is caught by their hands.' When they leap, they always seize with their hands the branch on which they intend to rest. They make nests of grass and leaves for their young in the branches of trees. They are a favourite article of food in Senegal.

GALA'NGALE (*Alpinia*), a genus of plants of the natural order *Zingiberaceæ* or *Scitamineæ*, having perennial stems with terminal inflorescence and succulent fruit. The root-stocks possess stimulating properties similar to those of ginger. The true G. is the produce of *A. galanga*, a native of the Eastern Archipelago, and cultivated there; having a stem six or seven feet high, broad leaves, and a branched panicle of greenish-white flowers. The root-stock, when young, yields a kind of arrow-root, and is used as an article of food; it acquires pungency and aromatic properties as it becomes older. G. is much used in the East for the same purposes as ginger; it is also used to a very considerable extent on the continent of Europe, but very little in Britain. Inferior kinds are obtained from several species of *Alpinia;* and from a plant of an allied genus, *Kaempferia Galanga*, the root-stock of which is commonly sold in the bazaars of Northern India.

GALA'NTHUS. See SNOW-DROP.

GALAPA'GOS ISLANDS (so named from *galápago*, the Spanish word for *tortoise*) are a volcanic group in the Pacific, situated on or near the equator, and in long. between 89° and 92° W. They are thirteen in number, the largest measuring 60 miles by 15, with an elevation of 4000 feet. They can hardly be said to be peopled, being visited chiefly for their turtles, which are of enormous size. The ten principal members of the cluster are Albemarle, Indefatigable, Chatham, Charles, James, Narborough, Hood, Barrington, Bindloes, and Abingdon.

GALASHIE'LS, a flourishing manufacturing town, and burgh of barony, of Scotland, is situated on both banks of the Gala, about one mile from its junction with the Tweed, and is partly in Selkirkshire and partly in Roxburghshire. It is 32 miles south from Edinburgh by road, and 33¼ by railway. The town is of comparatively modern erection, the greater part of it having been built within the last 20 years. The superior of the barony is Hugh Scott of Gala. The government of the town is under the Police Act of 13 and 14 Vict. cap. 23, and for all purposes of the act the burgh is held to be wholly in Selkirkshire. The town is generally well built, particularly the modern houses in the suburbs, and the new factories; but it is unhappily much crowded. The staple trade is the manufacture of woollen goods, known as 'tweeds' and plaidings. A few shawls are still occasionally made. There are 16 woollen factories, all of which, with the exception of two, are driven either by steam or steam and water-power combined. The total number of 'sets of machines' in these is 60, which turn out goods annually to the value of £300,000. Pop. within the burgh in 1861, 6500. G. has a flourishing grain market, held every Tuesday. The mills employ upwards of 2200 hands.

GALATA, a suburb of Constantinople (q. v.).

GALA'TIA was in ancient times the name of a country of Asia Minor, and was so called from a body of Gauls who settled there. In the 3d c., great hordes of Gauls, under Brennus, invaded Greece. Some of them took possession of Byzantium and the Propontis, passed the Hellespont on the invitation of Nicomedes, king of Bithynia, in the year 278 B.C., subdued Troas and the north of Phrygia, and were first checked by Attalus, king of Pergamus, in a great battle about the year 239 B.C., and compelled by him to settle permanently within certain limits. The state of G., which hitherto had had no accurately defined boundaries, was now confined between Paphlagonia, Pontus, Cappadocia, Lycaonia, Phrygia, and Bithynia. It was also called Gallogræcia, and was peopled by numbers of Phrygians, Greeks, and Paphlagonians, as well as Gauls or Celts. The form of government was at first purely aristocratic, but at a later period the twelve tetrarchs who shared the government among them, in conjunction with a senate of 300 members, succeeded in making their dignity hereditary. At length one of them (30 B.C.), supported by Pompey, assumed the title of king. After his death, the kingdom descended to Amyntas, but was shortly after conquered by the Romans, and converted into a Roman province, divided under Theodosius into *Galatia prima*, with the capital Ancyra, and *Galatia secunda*, with the capital Pessinus. The majority of the Gauls of G. retained their old Celtic language as late as the time of Jerome (4th c.), who says that they spoke the same dialect as the people about Treves; and as Jerome had himself lived there, and was a good scholar, he may be regarded as an authority on the subject. G. was twice visited by the Apostle Paul.

GALA'TIANS, EPISTLE TO THE. This epistle was written by the Apostle Paul during his residence at Ephesus, probably about the year 56 A.D., and is generally reckoned the third or fourth of the Pauline epistles in the order of time. The circumstance which called it forth was the diffusion throughout the Galatian churches, of Judaistic practices and notions, chief among which stood the famous rite of circumcision, regarded by Paul as the symbol of all that was exclusive, external, merely

l, and therefore thoroughly antagonistic to iversality of the gospel. Paul had himself ne first to preach Christ in this region, and majority of his converts were Gentiles, ld naturally vex him all the more keenly them lapsing into practices inconsistent heir new faith, and for which they had not he excuse that might have been proffered e Jews, viz., that antiquity had made such a venerable. It would also appear that the ing adversaries of Paul had been circulating us reports concerning himself, hinting that no divinely appointed apostle, but at best e messenger of the church of Jerusalem, e had quarrelled with Peter, the great apostle circumcision, and that he could play 'fast ose' on this very question of circumcision

In his reply to the underhand attacks calumniators, Paul asserts the truth of his passionately declaring that he would pro- a curse on the very angels from heaven, if ould dare to preach another, vindicates his ship, and gives the true version of the story variance with Peter. He then proceeds to the relation of Judaism to Christianity, and with a series of exhortations and admoni- the first of which is the well-known 'Stand erefore in the liberty wherewith Christ hath as free, and be not entangled again with the of bondage' (v. 1). The commentaries on ns are very numerous; among others may ntioned those of Luther, Winer, Rückert, De Meyer, Ellicott, and Alford.

LATI'NA, S. PIETRO IN GALATINA, a town in uth of Italy, in the province of Otranto, is d in a fertile but unhealthy plain, 13 miles of the town of Lecce. Some maintain that very ancient place, but there seems no his- ground for the assertion. G. is a thriving rcial town, and possesses fine public edifices andsome churches. Pop. 8400. Raimondo , Prince of Taranto, and Lord of Galatina, nded the town with ramparts, as a tribute citizens for having ransomed him from the for 12,000 ducats.

LATO'NE, a very ancient town in the south ly, in the province of Otranto, about nine north-east of Gallipoli, is situated in a very nt insalubrious plain. Pop. 5500. In the le between Joanna Queen of Naples and o, G., having declared for the former, was d by Alfonso, and its ramparts destroyed. It en possessed by several illustrious families.

LAXY, THE (Gr. *gala*, *galaktos*, milk), or ilky-Way, is the great luminous band which stretches across the heavens from horizon to , and which is found, when carefully traced, n a zone, completely encircling the whole almost in a great circle. At one part of rse, it opens up into two branches, one faint terrupted, the other bright and continuous, do not reunite till after remaining distinct out 150°. This great zone has occupied the osition in the heavens since the earliest ages. ader will find its course mapped out on any al globe, and a verbal account of it in Sir John el's *Outlines of Astronomy*, by which he may e accuracy of the chart. That course, as by the naked eye, following the line of its t brightness, conforms nearly to that of a ircle, called the Galactic Circle, inclined at an of about 63° to the equinoctial, and cutting ircle in 0 hours 47 minutes, and 12 hours 47 s right ascension. Throughout the space as above stated, it is divided into two branches, this great circle is intermediate to the two, lying nearer that which is the brighter and more continuous. The most casual survey of the Galaxy shews that it is wanting in regularity of outline. Besides the two great branches into which it divides, it has many smaller ones which spring out from it. At one point, it diffuses itself very broadly, and opens out into a fan-like expanse of interlacing branches nearly 20 in breadth. At the same point the branches terminating abruptly, a wide gap presents itself in the zone, on the opposite side of which it recommences its course with a similar assemblage of branches. At other points, its course is described by Sir John Herschel as 'irregular, patchy, and winding;' while at more than one point, in the midst of its brightest parts, broad dark spaces occur. One of these, known from early times among navigators as the 'coal-sack,' is a singular pear-shaped vacancy of about 8° in length, and 5° broad, occurring in the centre of a bright area overlying portions of the constellations of the Cross and Centaur. The 'coal-sack' occupies about half the breadth of this bright space, and presents only one star visible to the naked eye, though it contains many telescopic stars. Its blackness, which attracts the most superficial observer, is thus due to the contrast with the brilliant ground by which it is surrounded.

The Galaxy was examined by Sir William Herschel with his powerful telescope, and found to be composed entirely of stars. How a collection of stars can assume such appearances as are presented in the Galaxy, is explained in the article Stars (q. v.).

GALBA, SERVIUS SULPICIUS, Roman emperor from June 68 A.D. to January 69, was born 24th December 3 B.C., of a respectable family. He was raised to the consulship in 33 A.D.; and in the administration of the province of Aquitania under Tiberius, of Germany under Caligula, of Africa under Claudius, and of Hispania Tarraconensis under Nero, he distinguished himself for bravery, strictness, and justice. His friends had urged him, on the death of Caligula, to take possession of the throne, but he continued faithful to Claudius, and therefore stood high in his favour. In 68, Julius Vindex rose with the Gallic legions against Nero, and called on G. to assume the imperial dignity, and thus rid the earth of its oppressor. G., who had been informed that Nero was contriving his death, came forward against him at first as the legate of the Roman people, and it was only when he heard of Nero's death that he proceeded to Rome to take possession of the throne offered him by the Prætorians. G. was now upwards of 70 years old, and it soon appeared that his character had deteriorated, as, indeed, had already been manifested in his later administrations. Indulgence to greedy favourites, ill-timed severity, above all, avarice, which led him to withhold the usual donatives to the troops, made him unpopular. The legions in Upper Germany called on the Prætorians to choose another emperor; G. thought to soothe them by adopting Piso as his coadjutor and successor; but he thus offended Otho, who, as administrator of Lusitania, had supported G., and looked to be rewarded. The Prætorians, who had received no donative on occasion of Piso's adoption, were easily excited to insurrection by Otho, and the emperor having gone out to quell the rebellion, was cut down by the soldiers as he crossed the forum.

GA'LBANUM, a gum resin used in medicine in the same cases as assafœtida. It is principally employed in chronic catarrh, and has been given (especially by the Germans) in amenorrhœa and chronic rheumatism. It is generally administered

in the form of the *compound galbanum pill*, which contains galbanum, sagapenum, assafœtida, myrrh, and soft soap. It is sometimes applied externally in plasters as a mild stimulant in indolent swellings. It is brought from the Levant, and appears in commerce either in tears or in large masses. It is soft, ductile, whitish, or, when long kept, yellowish in colour; has a peculiar balsamic odour, and an acrid, bitter taste. Although it has been known from the earliest ages, and is mentioned by Moses (Exod. xxx. 34) under the name *chelbenah* (translated galbanum in the English Bible), it is still uncertain from what plant it is derived. *Galbanum officinale*, *Ferula galbanifera*, and *Opoidia galbanifera*, all of the natural order *Umbelliferæ*, have, on various grounds, been supposed to be the source of galbanum; and the confidence with which they have been so represented has perhaps prevented travellers from making that inquiry into the subject which otherwise they might have made. It is highly probable that galbanum is the produce of an umbelliferous plant. *Bubon Galbanum*, a plant of this order, found at the Cape of Good Hope, yields a gum resin very similar to galbanum.

GALE, or SWEET GALE (*Myrica gale*), a small shrub of the same genus with the North American Candleberry (q. v.), and very nearly allied to it—a native of all the northern parts of the world, growing in bogs and in moist gravelly soils, very

Gale (*Myrica gale*):
a, a scale of the catkin, inside; *b*, stamens; *c*, an anther.

abundant in some parts of Britain, but very local. It has small lanceolate slightly serrated leaves, which are sprinkled with resinous dots, and emit a most agreeable fragrance. Its berries are small, and sprinkled with golden resinous dots. The northern nations formerly used this plant instead of hops. The leaves were also employed as a remedy for itch, and have the power of keeping away moths. A decoction of them is efficacious against bugs. By distillation they yield a yellow essential oil. In the Highlands of Scotland, beds are often made of the twigs of gale, which is there called *noidh*.

GALEN, CHRISTOPH BERNHARD VON, Bishop of Münster, and one of the greatest generals of his time, was born at Bispink, in Westphalia, 15th October 1600. After completing his studies in the Jesuit college of Münster, and at the universities of Cologne, Mayence, Louvain, and Bordeaux, he held several political offices, and was at last made Bishop of Münster, 14th November 1650. The vigour of his administration immediately began to appear in restoring church-discipline, in allaying a famine which prevailed at the time, in promoting trade, and ridding the country of foreign troops. He soon, however, fell into disagreements with the inhabitants of Münster, who, on applying to Holland, received 25,000 guilders to assist them against him; but with the support of 1200 cavalry from the emperor, the bishop reduced the town into submission in 1660, and continued to maintain his ascendency by severe measures. In 1664, on being appointed, along with the Markgraf of Baden, director of the military affairs of the Rhenish alliance, he proceeded with most of his own troops to the seat of the war against the Turks. After his return, he entered into alliance with England against the Netherlands, but the war was soon concluded, in consequence of the treaty brought about by Louis XIV. in 1666, according to which the States-general promised the restoration to the bishop of all his lands. A dispute, however, afterwards arose, and in 1672, G. again went to war with the Dutch in alliance with France. After some successes obtained in union with Turenne, he suffered such a heavy loss during the siege of Coevorden, by a storm which placed his camp under water, that he willingly concluded a treaty with the allies in 1674, in which he promised to give up all his conquests in the Netherlands. In the following year, he changed sides, and entered into alliance with the emperor against the French. By taking part, also, with the king of Denmark and the elector of Brandenburg in the war with Sweden, he added the duchy of Bremen and other places to his possessions. In 1678, he obtained considerable pecuniary compensation for being drawn into war with East Friesland; but while the peace negotiations were going on he died, 19th September. The family of G. is one of the oldest in Westphalia, and is at present represented by Count Matthias von Galen, whose brother, Count Ferdinand, has distinguished himself in the Prussian service as an able diplomatist.

GALE'NA, or LEAD-GLANCE, a mineral which is essentially a sulphuret of lead, the proportions being 13·3 sulphur and 86·7 lead; but usually containing a little silver, and sometimes copper, zinc, antimony, or selenium. It is of a lead-gray colour, with a metallic lustre, is found massive, or sometimes granular, or crystallised in cubes or octahedrons. It is very easily broken, and its fragments are cubical. It occurs in veins, beds, and imbedded masses, often accompanying other metallic ores, in primitive and secondary rocks, but most of all in what is known as transition or mountain limestone. It is found very abundantly in some parts of Britain. Almost all the lead of commerce is obtained from it. It sometimes contains so much silver, that the separation of that metal is profitably carried on. The lead is extracted from it by a very simple process. See LEAD.

GALENA, a thriving city of the United States, North America, is situated in the north-west corner of the state of Illinois, on both sides of the Galena river, and three miles from the junction of that stream with the Mississippi. It is 450 miles north of St Louis, and 250 miles north-north-west of Springfield. The city, owing to the irregularity of the ground on which it is built, has a bold and picturesque appearance. In and around the town, high bluffs, rising frequently to a height of more than 200 feet, everywhere occur. The streets rise in terraces, one above another, communicating by flights of steps; and among the public buildings are numerous churches and schools, a United States

apital, and a custom-house. G. owes its l rapid growth to the rich mines of lead rround it. In 1857, 34,183,250 lbs. of ned at 801,324 dollars, were exported ena. Copper is also found, though not in ntity. G. has manufactures of pottery, candles; it has also lead furnaces, iron and machine-shops; breweries, carriage- ories, and numerous mills. Besides lead, horses, cattle, pork, and agricultural In 1819 the first house was built at G.; contained 14,000 inhabitants.

NICAL, GA'LENIST, two words having to the controversies of the period of the letters, when the authority of Galen was sserted against all innovations, and parti- ainst the introduction of chemical, or rather ideas and methods of treatment into The Galenists adhered to the ancient in which drugs were prescribed, either in or in the form of tinctures and extracts, e the chemists professed to extract from essences, or quintessences (*quinta essentia*, ssence, supposed to be particularly pure, ng five processes to extract it), i. e., sub- small bulk, presumed to contain the whole the original drugs in a state of extreme tion, or purified from all gross and per- r superfluous matter. There can be no w-a-days, that upon both sides of this y there was a great deal of blind error dogmatism, which on the side of the as in Paracelsus, took the form of quackery icism; while the Galenists, on the other e the supporters of tradition and all its nces, and too often the envenomed par- old blunders or misconceptions, as opposed orms of truth. But the original idea of o afterwards became identified with the e Galenists, was rather to free the ancient from the irrational dogmas and methods rith which it had been overlaid by the and the monks, than to insist upon mere or upon Galen's authority in particular, ling the blind assent of mankind in oppo- iew truth. Now that chemistry has really new methods of preparing drugs, which many of those that have been used from emorial, it is still customary with some to rations by the latter methods *Galenical*, sted with the crystalline alkaloids, or the pure acids and bases, which contain the most of our most valuable vegetable See GALEN, PARACELSUS, ALCHEMY, and l articles on the materia medica.

NUS, CLAUDIUS, commonly called GALEN, lebrated physician, born at Pergamus, in 0 A.D. In his 17th year, his father, Nicon, hitherto destined him to be a philosopher, ience of a dream, chose for him the pro- medicine. This subject he first studied nus, afterwards at Smyrna, Corinth, and a. He returned to his native city in his , and was at once appointed physician hool of gladiators. In his 34th year, he Rome, where he stayed for about four l gained such a reputation, that he was ut declined, the post of physician to the He returned to his native country in his , and had scarcely resumed his ordinary life, when he received a summons from rors M. Aurelius and L. Verus to attend he north-eastern frontier of Italy, whither gone to make preparations for a war with ern tribes. He joined the camp towards the end of the year 169; but a pestilence breaking out, the emperors and their court set off for Rome, whither G. accompanied or followed them. On the return of M. Aurelius to the seat of war, G. obtained permission to be left at Rome, alleging that such was the will of Æsculapius, as revealed to him in a dream. How long G. stayed at Rome on this second occasion is not known, but we ascertain from his works that he attended M. Aurelius and his two sons, Commodus and Sextus, and that at about the end of the 2d c. he was employed to compound a celebrated medicine called Theriaca for the Emperor Severus. If the statement of one of his Arabic biographers be correct, who expressly says that G. was only twice at Rome, we must infer that the greater part of his middle and more advanced life was spent in that city. The place and date of his death are not known with certainty, but it is believed that he died in Sicily about the year 201.

The works that are still extant under the name of G. consist, according to Choulant, in his *Handbuch der Bücherkunde für die aeltere Medicin*, of 83 treatises acknowledged to be genuine; 19 whose genuineness has been questioned; 45 undoubtedly spurious; 19 fragments; and 15 commentaries on different works of Hippocrates. Besides these, he wrote a great number of works whose titles only are preserved, and altogether it is believed that the number of his distinct treatises cannot have been less than 500.

We may divide his works into (1) those on anatomy and physiology; (2) those on dietetics and hygiène; (3) those on pathology; (4) those on diagnosis and semeiology; (5) those on pharmacy and materia medica; (6) those on therapeutics, including surgery; (7) his commentaries on Hippocrates; and (8) his philosophical and miscellaneous works. We have most of these works in Greek, the language in which they were originally written; some are, however, preserved only in Latin translations, and a few only in Arabic. His most important anatomical and physiological works are —*De Anatomicis Administrationibus*, and *De Usu Partium Corporis Humani*. Of the latter, Dr Greenhill (Smith's *Dictionary of Greek and Roman Biography*) remarks that 'it is no less admirable for the deep religious feeling with which it is written, than for the scientific knowledge and acuteness displayed in it.' For a good general account of G.'s anatomical and physiological knowledge, we may refer to a memoir published by the late Professor Kidd of Oxford in the sixth volume of *The Transactions of the Provincial Medical and Surgical Association*, entitled 'A Cursory Analysis of the Works of Galen, so far as they relate to Anatomy and Physiology,' and Daremberg's *Exposition des Connaissances de Galien sur l'Anatomie, la Physiologie, et la Pathologie du Système Nerveux* (Paris, 1841), may also be consulted with advantage. His anatomical and physiological writings are by far the most valuable of his works. They contain undoubted evidence of his familiarity with practical anatomy; but whether he derived his knowledge from dissections of human bodies or those of the lower animals, is uncertain. The latter is the most probable view —(1) because he frequently recommends the dissection of apes, bears, goats, &c.; and (2) because he mentions, as something extraordinary, that those physicians who attended the Emperor M. Aurelius in his wars against the Germans had an opportunity of dissecting the bodies of the barbarians. Much curious information regarding G.'s views on dietetics and hygiène will be found in Adams's *Commentary on the First Book of Paulus Ægineta*. His pathology was very speculative and imperfect. In his diagnosis and prognosis, he laid great stress on the

pulse, on which subject he may be considered as the first and greatest authority, for all subsequent writers adopted his system without alteration. He likewise placed great confidence in the doctrine of critical days, which he believed to be influenced by the moon. In materia medica, his authority was not so high as that of Dioscorides. Numerous ingredients, many of which were probably inert, enter into most of his prescriptions. He seems to place a more implicit faith in amulets than in medicine, and he is supposed by Cullen to be the author of the anodyne necklace, which was so long famous in England. We cannot attempt to enter into his system of therapeutics. We may, however, observe, that his practice is based on two fundamental principles—(1) that disease is something contrary to nature, and is to be overcome by that which is contrary to the disease itself; and (2) that nature is to be preserved by that which has relation to nature. Hence arise two general indications of treatment—the one taken from the affection contrary to nature, which affection requires to be overcome; the other from the strength and natural constitution of the body, which requres to be preserved.

Before G.'s time, the medical profession was divided into several sects, who were always disputing with one another; as, for example, the Dogmatici, Empirici, Eclectici, Pneumatici, and Episynthetici. After his time, all these sects seem to have merged in his followers. The subsequent Greek and Roman medical writers were mere compilers from his writings; and as soon as his works were translated (in the 9th c.) into Arabic, they were at once adopted throughout the East, to the exclusion of all others. In short, G. reigned paramount throughout the civilised world till within the last 300 years. The records of the London College of Physicians afford a striking illustration of this fact, in so far as England is concerned. In 1559, Dr Geynes 'was cited before the college for impugning the infallibility of Galen. On his acknowledgment of his error and humble recantation, signed with his own hand, he was received into the college.'

The Greek text has been published four times. The first edition was the Aldine, printed in 1525, in 5 folio volumes; the latest and most accessible edition is that of C. G. Kühn, in 20 octavo volumes, the publication of which extended from 1821 to 1833. A good critical edition is still required.

GA'LERITES (*galerus*, a cap), a genus of fossil sea-urchins, peculiar to and abundant in the Chalk measures. The generic name, as well as that popularly given to them in the districts where they abound, viz., 'Sugar-loaves,' is descriptive of the elongated and more or less conical shape of their shell. The body in breadth is nearly circular or polygonal. The under surface is entirely flat, and has the mouth placed in its centre, with the vent near the margin. There are five avenues of pores reaching from the mouth to the summit. These fossils are often found silicified. The species figured is one of the most abundant; it has received its specific name from its resemblance to the white caps worn by the priests of Jupiter.

Galerites Albogalerus.

GALE'RIUS, VALERIUS MAXIMIANUS, a Roman emperor of humble parentage, was born near Sardica, in Dacia, entered the imperial army, and rose from one grade of military rank to another, until Diocletian conferred on him, along with Constantius Chlorus, the title of Cæsar (292 A.D.), and gave him his daughter in marriage. On the abdication of Diocletian (305 A.D.), he and Constantius became *Augusti*, or joint-rulers of the Roman empire. On the death of Constantius at York (306 A.D.), the troops in Britain and Gaul immediately declared their allegiance to his son, Constantine (afterwards Constantine the Great), much to the chagrin of G., who expected the entire sovereignty of Rome to fall into his hands. He died in 311 A.D. G. was a brave soldier and a skilful commander, but appears to possess no other claims to the respect of posterity. He hated the Christians 'with a perfect hatred;' and it is believed that it was he who forced Diocletian to issue his famous edict against them, which caused the *last* of the imperial persecutions. His mother, an ignorant pagan fanatic, is said to have exercised much influence over him; but it is highly probable that his treatment of the adherents to the Christian faith was also determined by a politic opposition to Constantius and his son, who tolerated, and even respected the new opinions and practices.

GALIA'NI, FERDINANDO, an Italian savant, was born in Chieti, a province of the Abruzzi, in 1728, and exhibited at an early period an extraordinary aptitude for learning. Philosophy, history, archæology, and more especially the science of political economy, were his favourite studies; but, nevertheless, he first attracted notice by a clever squib on the death of the public executioner. This consisted of a collection of essays eulogistic of the deceased, in which the style of the president and leading members of the Neapolitan Academy was admirably imitated. It was entitled, *A Collection of Papers in honour of Domenico Jannacone, Public Executioner, revised and issued by the President of the Academy, Gian Antonio Sergio, Advocate*, and excited universal comment in Naples. The young delinquent was condemned to a period of seclusion, prescribed for penitential exercises. His next publication, *Della Moneta*, was more deserving of his pen, and evinced his great learning and powers of reflection. It must be regarded as a valuable contribution to the science of political economy. The leading principle which it seeks to establish is, that coin is a merchandise, and that its value and interest ought to be left free like other goods. By the adoption of the sage monetary doctrines propounded by an economist, who barely numbered 20 years, the financial ruin of Naples is said to have been then averted. In 1751, he visited the chief cities of Italy, and was everywhere honourably received. From Pope Benedict XIV. he received repeated proofs of favour and confidence. Having contracted during his travels intimate friendships with some of the most famous naturalists of his country, he immediately entered with enthusiasm into their pursuits, and on his return to Naples collected a rich assortment of the stones and volcanic matter of Vesuvius, which he subsequently presented to the pope, accompanied by a learned thesis. On one of the stone specimens, he engraved the following suggestive inscription, '*Beatissime pater, fac ut lapides isti panes fiant;*' and received, by way of answer, the rich prebend of Amalfi, for which he had previously qualified himself by entering into holy orders. In 1759, he became secretary to the Neapolitan Embassy at Paris, where his wit, vivacity, and learning made him a universal favourite. In 1767, he visited England, whose social and political institutions he studied deeply. On his return to Paris, he wrote another treatise on political economy, entitled *Dialoghi sul Commercio del Grano* (Dialogues upon the Trade in Corn), in which he argues against both

sme protectionists and the pure free-traders. ecalled to Naples, he was successively d to various posts of trust and importance. at Naples in 1787, leaving behind him rare ns of musical MSS., ancient coins, sculptures, precious stones, cameos, &c.

'CIA, formerly a province in the north- Spain, with an area of 11,195 square miles, opulation of about 1,776,879 souls, has ided, since 1833, into the minor provinces ia, Lugo, Orense, and Pontevedra. The is mountainous, being covered by several the Asturian chain, rising in their highest) the height of about 6000 feet. Capes and Finisterre project into the Atlantic. nerous rivers form *Rias*, or small estuaries mouths, and afford secure havens and The principal river is the Minho, which, feeders, the Sil and the Avia, is navigable proaches the sea. G. is one of the most portions of Europe, and has a mild nourish- ite. Rich meadows and dense forests occur ere, but the soil is more suited to the culti- garden-produce than of corn. The inhabit-) are called Gallegos, are a robust, vigorous, istrious race. They visit various parts of try, and are employed in Madrid as water- porters, &c. Fishing and navigation are the ons most largely followed. Linen manufac- e been recently established. The principal re St Jago di Compostella, and the two fortified seaports Coruña and Ferrol.

For administrative purposes, een divided into three governments viz., , Cracow, and Stanislawow. G. takes its m the old fortress and town of Halicz, on ster. The original Slavonic inhabitants, the , were, towards the end of the 9th c., con- y the Russians of Kiew. The western por- he country had already become dependent d, and afterwards on Hungary. In 1382 stored to Poland, and continued to belong country till the partition of 1773, when G. ne of the crown-lands of Austria. In 1846, with the territory belonging to it, was, by of the three powers (Austria, Russia, and given up to the emperor of Austria, and nnexed to the crown-land of Galicia.

GALICZ. See HALICZ.

GA'LILEE, the name applied to a porch or chapel placed at the entrance to a church, beyond which women were not permitted to pass. In abbeys, for example, the monks came to the galilee to see their female relatives. A portion of the nave was sometimes marked off by a step, or, as at Durham, by a line of blue marble, to mark the boundary to which women were limited. There are fine specimens of galilees at Lincoln, Ely, and Durham.

GALILEE (Heb. *Galil*, a 'circle' or 'circuit') is the name originally applied to a small district belonging to the Jewish tribe of Naphtali (see Josh. xx. 7). Here were situated the 20 towns which Solomon gave to Hiram, king of Tyre, for his assistance in building the temple. Phœnician colonies, in consequence, appear to have established themselves here, or the towns perhaps reverted by some chance to their original Canaanitish occupants, for at a later period we find Isaiah (ix. 1) speaking of the district as 'Galilee of the nations.' These 'nations,' or Gentiles, appear to have greatly increased in numbers, and to have finally spread themselves over all the surrounding country, until, in the time of our Lord, the name 'Galilee' embraced the whole northern portion of Palestine from the Mediterranean to the Jordan. As early as the time of the Maccabees (book I. chap. v. verses 20—23), the number of Jews in G. was very small; Strabo, a contemporary of Christ, states that in his day it was mainly inhabited by Syrians, Phœnicians, and Arabs, to whom Josephus adds Greeks. The principal towns at the dawn of Christianity were Tiberias, Tarichæa, and Sepphoris; those that figure in the gospels are Cana, Capernaum, Nazareth, and Nain. The Jewish inhabitants of G. spoke a broader and coarser dialect than their southern brethren of Judæa, and were held in low estimation by the latter, partly on account of their more liberal sentiments in regard to religion. It has been thought likely that this liberality, the existence of which is indisputable, was owing to their intercourse with their different heathen neighbours. Every one of the disciples was a Galilean either by birth or residence, and consequently may not have been a *Jew* at all in the strict sense of the term; i. e., in being able to boast of having 'Abraham for his father.' The first three gospels are chiefly taken up with records of the Saviour's ministrations in this province. After the destruction of Jerusalem, the despised G., as if retributively, became the refuge of the proud doctors of Jewish law, and the city of Tiberias the seat of Rabbinical learning. The ruins of many fine synagogues are still extant in the old towns and villages of this region. At present, G. belongs to the pashalic of Damascus, in the Turkish province of Syria or Soristan, and, as of yore, is remarkable for its beauty and fertility. It still has a considerable number of Jewish inhabitants.

GALILEI, GALILEO, the creator of experimental science, was born at Pisa on the 15th of February 1564. He belonged to a Florentine family more ancient than opulent. G., by desire of his father, exclusively directed his early studies to medicine, and the prevailing Aristotelian philosophy, the dogmas of which he soon ventured to disbelieve and despise. At the age of eighteen he made one of his most important discoveries. Happening on one occasion to observe, in the cathedral of Pisa, the oscillation of a lamp casually set in motion, G. was struck with the apparent measured regularity of its vibrations; and having tested the correctness of this observation by

comparing the beat of his own pulse with the action of the pendulum, he concluded that by means of this equality of oscillation a simple pendulum (q. v.) might become an invaluable agent in the exact measurement of time. This discovery he subsequently utilised by the successful application of the pendulum in constructing a clock for astronomical purposes. G.'s irrepressible bias towards mechanical constructions and experimental science received a new impulse from his intercourse with a friend of his father's, Ostilio Riccio, professor of mathematics, who, in compliance with the youth's entreaties, initiated him into the principles of mathematics. Such was G.'s absorption and delight in his new studies, that his father at length sanctioned his abandonment of the art of medicine, in order that he might concentrate his powers on his chosen sciences. The first fruit of his geometrical investigations was the invention of a hydrostatic balance, by which the specific gravity of solid bodies might be ascertained with the nicest accuracy. In 1589, the fame of G.'s extraordinary learning having reached the Grand Duke of Tuscany, this enlightened prince appointed him professor of mathematics in the university of Pisa, where he covertly inculcated many of those great innovations in physical science which have since added such lustre to his memory. About this period he turned his attention to the then very imperfectly comprehended laws of bodies in motion; and in opposition to all received systems, he propounded the novel theorem, that all falling bodies, great or small, descend with equal velocity. This soon led him to the discovery of 'the *three* laws of motion,' and the law regulating the motion of falling bodies, which is expressed by the formula $S = \frac{1}{2} ft^2$. This theory of falling bodies was proved correct by several experiments which were made from the summit of the leaning tower of Pisa, greatly to the chagrin of the Aristotelians, whose enmity to G. now grew more decided. In consequence, he deemed it prudent to relinquish his chair at Pisa, and retired to Padua, where he accepted the offer of the Venetian senate to lecture on mathematics in the university for the space of six years. It is also said, however, that G. lost his chair at Pisa, from having ridiculed the mechanical pretensions of John de Medici, son of Cosmo I. G.'s engagement at Padua was eventually prolonged to the term of 18 years; but so urgent was his desire to return to his birthplace, that he sought a restoration to his former post at Pisa, and was gratified by an assent being eagerly accorded by Cosmo de' Medici, with exemption from any but a voluntary exercise of the duties of the professorship. During his sojourn at Padua, his course of lectures enjoyed extraordinary popularity; crowds of pupils flocked to hear him from all parts of Europe; and he was the first to adapt the Italian idiom to philosophical instruction. Among the various and noble discoveries with which he enriched science, may be noticed a species of thermometer, a proportional compass or sector, and more important than all, the construction of the refracting telescope for astronomical investigation. In 1609, he offered his first complete telescope to the Doge of Venice, Leonardi Deodati, by whom it was tested from the tower of St Mark with equal surprise and delight. In the same year he constructed a microscope; and then this indefatigable interpreter of the mysteries of nature commenced his astronomical researches by means of his own telescope. He speedily concluded that the moon, instead of being a self-luminous and perfectly smooth sphere, owed her illumination to reflection, and presented an unequal surface, deeply furrowed by valleys and mountains of great extent. The Milky Way he pronounced a track of countless separate stars; and these discoveries were crowned by a still more important series of observations, which led to the discovery of the four satellites of Jupiter on the night of the 7th of January 1610 (though it was not till the 13th of the same month that he came to the conclusion that they were satellites, and not fixed stars), which he named the Medicean stars, in honour of his constant protectors in that family. He also was the first to note movable spots on the disc of the sun, from which he inferred the rotation of that orb. Encircled by the lustre of these sublime discoveries, he departed from Padua, and returned to Tuscany in 1610, where renewed quarrels with the Aristotelians disquieted and embittered his existence. In 1611, he visited Rome, and was received with great distinction, being enrolled a member of the Lincei Academy; but four years later, on repeating the visit, his reception was widely different, as by that time in his work on the solar spots he had openly advocated the Copernican system, and was in consequence denounced as a propounder of heretical views. He repaired again to Rome, to demand an experimental inquiry into the soundness of his views; but the grand duke apprehending inquisitorial dangers for his favourite, summoned him back to Tuscany; at the same time the pope, through the famous Cardinal Bellarmine (a sincere friend of G.'s), commanded him to abstain from all future advocacy of his heretical doctrines. Some time after, he wrote his most famous work in the form of a dialogue between three fictitious interlocutors, the one in favour of the Copernican system, the second an advocate of the Ptolemaic, and the third a rabid supporter of the Aristotelian school. Of course, the whole weight of the *proof* falls into the Copernican scale; and nothing can exceed the classic beauty of this composition, or the compactness of the chain of its argument. In 1630, G. contrived to obtain the papal imprimatur, which was subsequently revoked; but having got a similar authorisation at Florence, he published, in 1632, this exponent of his opinions under the title of *Un Dialogo intorno i due Massimi Sistemi del Mondo*. Hardly had the work been issued, when it was given over to the jurisdiction of the Inquisition. Pope Urban, previously Cardinal Barberini, and, until now, a friend and eulogist of G., was led to believe that G. had satirised him in this work under the title of *Simplicio*, as one who is careless about scientific truth, and who timidly adheres to the saws of antiquity. He resolved to punish the audacious philosopher. In spite of his 70 years and heavy infirmities, G. was summoned before the Inquisition to answer for his heresies. After a wearisome trial and incarceration, his judges condemned G. to abjure by oath on his knees the sublime truths of his scientific creed. This he was weak enough to do. His latest biographer, M. Philarète Chasles, however, denies that G. was put to the torture, and pronounces the letter of G. to Reinecci, from which Tiraboschi quotes to prove it, a forgery. His famous whisper, *E pur si muove* ('But nevertheless it does move'), is also in danger of being regarded as a fiction. G. was sentenced to an indefinite term of imprisonment in the Inquisition, which was soon commuted by Pope Urban, at the request of Ferdinand the Grand, Duke of Tuscany, into permission to reside at Siena, and finally at Florence, should the prisoner's health require the change. In his retreat at Arcetri, he continued with unflagging ardour his learned researches, even when hearing grew enfeebled and sight was extinguished. He died on the 8th of January 1642, at the age of 78, and was interred

rders in the cathedral of Santa Croce, ajestic monument symbolises his great ta. His disposition was truly genial; with keenness the social wit and banter sen friends, and the generous pleasures quet; and the readiness with which he accepted atonement, modified a some- ible disposition. The great deficiencies acter were a want of tact to keep out of and a want of moral courage to defend en involved in them. His biting satirical than his physical discoveries, was the is misfortunes. The dignitaries of the o persecuted G., warned him beforehand adliest way to be 'more prudent.' Their persecuting opinion, or rather, in G.'s *strated fact*, is of course utterly inex- ut that is no reason why we should run r extreme, and declare G. to be a martyr. nan had ever less claim to the title. It ht to add, that the congregation of the by which G. was condemned, is not y Roman Catholics to speak with the thority of the Catholic Church, nor are s regarded as infallible even by the most ltramontanes. G. was of small stature, robust and healthy frame; his counte- attractive, and his conversation cheerful.

art, and cultivated especially music y. Ariosto he knew almost by heart, ciated keenly the beauties of this great Tasso, on the other hand, he unduly l, and inflicted much pain on the sen- it of the poet by his severe criticism *onsiderazioni al Tasso*. His own style s, flowing, and elegant. His collected ve been published in 13 volumes, 8vo 11), and at various other places. His upil, Viviani, has written a life of G.; see water in the *Library of Useful Know-* David Brewster in Lardner's *Cabinet z;* and M. Philarète Chasles's *Galileo a Vie, son Procès, et ses Contemporains, Documents Originaux* (Paris, 1862). We y recapitulate G.'s most important contributions to physical science under the following heads: 1. The relation between space and time in the case of falling bodies, also the 'three laws of motion;' 2. The path of projectiles is a parabola; 3. The isochronism of the pendulum; 4. That air has weight, also partial discovery that suction is owing to the pressure of the atmosphere; 5. The re-invention of Aristotle's theory respecting sound; 6. The invention of the telescope; 7. The discovery of the satellites of Jupiter, phases of Venus, and spots on the sun. For the nature of these discoveries, see PENDULUM, FALLING BODIES, PROJECTILES, &c.

(*Cyperus longus*): a, a single flower; d, end of spikelet in

GALINGALE, a name often applied to the tubers of *Cyperus longus*, and sometimes to the whole plant. See CYPERUS.

GALIUM. See BEDSTRAW.

GALL. A synonym for bile, the secretion of the Liver (q. v.).

GALL, FRANZ JOSEPH, the founder of phrenology, was born at Tiefenbrunn, near Pforzheim, on the borders of Baden and Würtemberg, 9th March 1758. He studied medicine at Vienna, and settling there, became known as a practical physician, and by the publication of his *Philosophisch-Medicinische Untersuchungen über Natur und Kunst im gesunden und kranken Zustande des Menschen* (Vienna, 1791). But he acquired a much more extended reputation by his lectures on the structure and functions of the brain, which he began to deliver in 1796. See PHRENOLOGY. His views were so subversive of received doctrines on the subject of mind, that a spirit of opposition was excited, and the lectures were prohibited in 1802 by the Austrian government. Along with his pupil Dr Spurzheim (q. v.), who became his associate in 1804, G. quitted Vienna in 1805, and during his travels through Germany, Holland, Sweden, and Switzerland, expounded his views in many of the universities and principal cities, where he found many adherents as well as opponents. In 1807, he settled as a physician in Paris, and there began lecturing and writing for the propagation of his opinions. As a foreigner teaching science to the French, he was discountenanced by Napoleon. On 14th March 1808, he and Spurzheim presented to the Institute of France a Memoir of their discoveries, on which a committee of the members of that body (including Pinel, Portal, and Cuvier) drew up an unfavourable *Report*. Of this there is a translation in the *Edinburgh Medical and Surgical Journal* for January 1809. G. and Spurzheim thereupon published their *Memoir*, with a reply to the *Report*, in a volume entitled *Recherches sur le Système Nerveux en général, et sur celui du Cerveau en particulier; suivi d'Observations sur le Rapport*, &c. (Paris, 1809, 4to). This was followed by their larger work, *Anatomie et Physiologie du Système Nerveux*, &c. (Paris, 1810—1819, 4 vols. 4to), with an Atlas of 100 plates; but the two phrenologists having parted in 1813, the name of G. alone is prefixed to vols. 3 and 4; and it alone is borne by a reprint of the physiological portion of the work, entitled *Sur les Fonctions du Cerveau, et sur celles de chacune de ses Parties* (Paris, 1825, 6 vols. 8vo). Of the contents of that edition, there is a summary in the *Phrenological Journal*, x. 459. A German translation of it, entitled *Vollständige Geisteskunde*, &c., appeared at Nuremberg in 1833; and an indifferent English version by Dr Winslow Lewis, junior, at Boston, United States, in 1835 (6 vols. 12mo). A translation of the chapters *On the Functions of the Cerebellum* is included in a volume with that title, published by G. Combe (Edin. 1838, 8vo). In answer to accusations of materialism and fatalism brought against his system, G. had early published a part of the work under the title of *Des Dispositions innées de l'Ame et de l'Esprit*, &c. (Paris, 1812). He continued to practise medicine and pursue his researches at Montrouge, near Paris, till his death, 22d August 1828. A catalogue of his collection of skulls, &c., is printed in the *Phrenological Journal*, vols. vi. and vii. As a thinker, he was original and independent; as an observer, industrious and persevering; as a writer and lecturer, forcible and clear. Even those who reject his system as insufficiently borne out by facts, allow that he has conferred signal service on science by his discoveries in the anatomy and physiology of the brain, and that by stirring to the bottom many questions regarding mind, and the organic

conditions by which its phenomena are affected, he has contributed to deepen the foundations of psychology, and to render it applicable to human affairs. It is long since the apprehension of danger to religion and morality from his doctrines died away among the intelligent and well informed. In Great Britain, phrenology became known less through G.'s writings than through those of Spurzheim, who came over to England in 1814. So early, however, as 1803 it had been criticised in the *Edinburgh Review*, ii 147. See further, *Transactions of the Phrenological Society*, p. 1 (Edin. 1824); *Phrenological Journal*, vols. 5, 8, 9, 11, 15, 16, 17, and 19; a *Historical Notice of the Discovery of the Anatomy of the Brain*, appended to G. Combe's *Phrenology Applied to Painting and Sculpture*, p. 151 (Lond. 1855); Professor Laycock on *Mind and Brain*, ii. 164, 168 (Edin. 1860).

GALL, St, one of the most important manufacturing towns of Switzerland, capital of the canton of the same name, is pleasantly situated on the left bank of the Steinach, at an elevation of 2081 feet above sea-level, and is distant 40 miles from Zürich in a straight line east-north-east. It is a well-built town, surrounded by old walls; but the ditch has been filled up and converted into garden-grounds. Among the principal buildings are the Abbey Church, which was completely modernised in the course of last century; the monastery, portions of which are now occupied by public government offices, and by the convent library, containing 1506 MSS., and among them several of the classics, that were at one time thought to have been lost. See GALL, ST, ABBEY OF. The greatest building is the schoolhouse, which contains a natural history museum and the town library. The manufactures of St G. consist chiefly of cotton goods, particularly of *Swiss muslins*. It has also linen manufactures, carries on bleaching and embroidery extensively, and is the great mart for the produce of Appenzell and Thurgau. Pop. 12,000.

GALL, ST (Ger. *St Gallen*), ABBEY OF, a celebrated Swiss Benedictine monastery, which gives its name to the canton in which it is situated. It was founded early in the 7th c. by St Gall, or Gallus, an Irish monk, a disciple of Columbanus, and one of that distinguished band, who in that age, from the various monasteries of Ireland and the kindred establishment of Iona, carried the elements of learning and civilisation over a large portion of the continent of Europe. Gallus had accompanied Columbanus to Anegray and Luxeuil, and ultimately himself, in company with a few followers, repaired to Switzerland, where, in a hermitage on the banks of the Steinach, he acquired such fame for sanctity by his teaching and example, that on his death, there arose, in honour of his memory, what, in progress of time, became one of the most celebrated of the many magnificent establishments of the Benedictine order. The succession of abbots from the days of Gallus is carefully chronicled, and the share which each of them had in the erection and enlargement of the monastic buildings. It will be enough to say that, through the piety and munificence of the faithful, the abbey of St G. gradually became one of the master-pieces of medieval architecture; and that the genius and skill which were lavished on its construction, and on the decoration of its halls and cloisters, had a large share in developing the Christian art of the period. The monks of St G., too, may be reckoned among the best friends and preservers of ancient literature. They were indefatigable in the collection and transcription of MSS.—biblical, patristic, sacred and profane history, classical, liturgical, and legendary. Some of the MSS. which are still shewn in the library are monuments of the skill and industry of the copyists; and several of the classics, especially Quintilian, Silius Italicus, and Ammianus Marcellinus, have been preserved solely through the MSS. of St Gall. For a time, the abbey was subject to the Bishop of Constance, and an animated dispute was for a long time maintained between that prelate and the monks as to the right of electing the abbot. It ended, however, in the recognition of the right of free election; and ultimately, from the growth of the monastic possessions, and the important position which the abbot held, the monastic domain, which comprised a great part of Northern Switzerland, became a distinct jurisdiction, within which the abbot, like many of his brethren in the great Benedictine monasteries, exercised all the rights of a suzerain. For several centuries, the abbey of St G. held one of the highest places in the order. Its schools enjoyed wide reputation. Its members held a distinguished place among the scholars of medieval Germany; and many of them, as, for example, Notker, are known to have cultivated not only the ordinary learning of the schools, but also physic, mathematics, and astronomy. The school of St G., too, was one of the most eminent for the cultivation of music, and its MSS., preserved in its library, have been extensively made use of by the restorers of ancient ecclesiastical music. A town of considerable importance grew up around the monastery, and was called by the same name; and as the wealth and influence which attached to the dignity of the abbot began to make it an object of ambition to the rich and powerful families, we find the succession of abbots, in the 13th and 14th centuries, sadly degenerated from their pious and learned predecessors in the office. A stringent reform was enforced about the time of the council of Constance; but the burghers of St G. had grown dissatisfied under this rule; and on the outbreak of the Reformation in 1525, they threw off their subjection, and embraced the new doctrines. At the close, however, of the religious war in 1532, the Catholic religion was re-established, and the abbot reinstated, though with diminished authority, in his ancient dignity. At the French Revolution, the abbey of St G. was secularised (1798), and its revenues were soon afterwards sequestrated (1805). By a later ecclesiastical arrangement, the abbacy of St G. was raised to the dignity of a bishopric, which, in 1823, was united to that of Chur. They were afterwards, however, separated; and in 1847, St Gallen was erected into a bishopric, with a distinct jurisdiction.

GALL, ST, CANTON OF, a Swiss canton, bounded on the N. by Thurgau and the Lake of Constance, E. by the Vorarlberg, S. by the Grisons and Glarus, and W. by Zürich and Schwytz. The country is for the most part mountainous; the general slope of the surface being towards the north and north-west. Several of the summits attain a height of 6000 or 7000 feet, one (the Gallanda) a height of 8800, and one (Schirbe) that of 9000. The Rhine touches the canton of St G. near Pfeffers, and for about 50 miles forms its eastern boundary. The chief rivers that intersect the canton are the Seez, the Tamina, and the Thur. Portions of the Lakes of Constance, Zürich, and Wallenstadt, lie within its boundaries. The chief produce of the canton consists of fruit, especially apples and cherries, wine, *kirschwasser*, corn, maize, and potatoes. The amount of corn produced is but trifling, and a considerable part of the land is devoted to pasture. Iron is found in considerable abundance, and of good quality, at Gunzenberg; and coal, as also peat, is raised within the canton.

anufactures are of linen, muslin, cotton, lace, dery, and glass; and wax-bleaching and g are also extensively carried on. The linen- s of very old standing. Its seat is the town Gall, which was celebrated for its linens as s the 13th c., but it has in later times been entirely replaced by the manufacture of

erection of St G. into a distinct canton is atively of recent date. It was formed upon ularisation of the domain of the abbot by ion of the abbey territory with several dis- previously subject to the older cantons—viz., einthal, Sargans, Werdenberg, Sax, Gaster, h, together with the town of Rapperschwyl; ; the new canton of St G. actually encloses ll sides the canton of Appenzell, which forms, ere, an island within the new district. The ge is a Swabian dialect of German. The of St G. sends eight members to the National l. Its government is one of the most demo- n Switzerland. It consists of a Great Council, mbers of which are chosen for two years by tes of all citizens above 21 years; and who s from among themselves for four years cutive, called the Lesser Council, consisting en members. The local prefects and other officers are elected annually in their several s. The area of the canton is 772 square Pop. (1860) 181,091, of whom 111,087 were cs, and the rest chiefly Calvinists. Chief St Gall (q. v.).

LA OX, or SANGA, a remarkable species ety of ox inhabiting Abyssinia. The chief rity is the extraordinary size of the horns, rise from the forehead with an outward, and n inward curve, producing a very perfect of a lyre, and finally curve a little outwards

la Ox (copied from Vasey's work on *The Ox*).

tip, to which they taper gradually. In a en presented by Mr Salt to the Museum of llege of Surgeons in London, the length of orn measured round the outer side is three a and a half inches, the circumference of each base is one foot three inches, the distance n the tips three feet four inches. A space of three or four inches between the horns is d by a tuft of hair. Bruce represents the us growth of the horns as a kind of dis- monstrosity, accompanied with emaciation animal. Salt controverts this account, but figures the animal so as rather to confirm it. The G. O., however, differs from the common ox in having a hump on the shoulders, in the abrupt descent of the back towards the tail, in the greater length of the legs, and in the narrower space between the horns.

GALLAND, ANTOINE, a French orientalist and numismatist, was born in 1646 at Rollot near Montdidier, in Picardy. In 1670 he accompanied the French ambassador, Nointel, to Constantinople, when he visited Jerusalem and other places. He returned to France in 1675, but subsequently made two voyages to the East. Colbert and Louvois interested themselves on his behalf, and procured him the means of devoting himself to study. In 1701, he was made a member of the Académie des Inscriptions, and in 1709, professor of Arabic in the Collége de France. He died 17th February 1715. The greatest part of G.'s writings relate to Numismatics and the East, but the thing which has secured him the most imperishable reputation, is his translation of the *Arabian Nights* in 12 vols. (*Mille et Une Nuits, Contes Arabes*, Paris, 1704-1708). This was the first translation of these grotesque and gorgeous stories ever made into any language of Christendom, and for a good while G. got the credit of being himself the author as well as the translator. Among his other writings, we may mention *Paroles remarquables, bons Mots, et Maximes des Orientaux* (Paris, 1694), and *Les Contes et Fables Indiennes de Bidpaï et de Lokman* (2 vols., Paris, 1724).

GALLAS ('invaders'), a race inhabiting the south and east of Abyssinia. The general name by which the tribes designate themselves is *Oroma* (*orma*, men). Although generally belonging to the negro race, they are not purely negroes, but form with the Fulahs, Mandingoes, and Nubas, as it were, the transition to the Semitic variety, and seem to belong to that great family inhabiting the east of Africa, from the frontiers of the Cape land to Abyssinia, and usually denominated the Kafirs. They are a vigorous, well-formed people, of a dark-brown colour, with hair frizzled, but not quite woolly, round faces, and small sharp eyes, and are distinguished not less by their energy and warlike spirit, than by their mental capacities. They first appear in history in the 16th c., as a barbarous people, extending their conquests from the interior of Africa, laying waste, by constant incursions, the countries of Eastern Africa, to the mountains of Abyssinia, gradually subduing or expelling the original inhabitants (hence their name), occupying great part of Abyssinia, and advancing as far as the Red Sea and the Gulf of Aden. It is only of late years that their power in Abyssinia, and their incursions into that country, have been partially checked, chiefly by the vigorous government of the king of Shoa, who has subdued some of the G. tribes, and induced them to profess such Christianity as exists in Abyssinia. They still, however, occupy many districts of Abyssinia, and extend their power to an indefinite extent over the countries situated south and south-west of it. Politically, the G. do not form a single nation, but are divided into numerous tribes, forming separate kingdoms and states, which are frequently at war with each other. Most of the G. follow pastoral avocations. Some, however, through intercourse with the semi-christian, semi-civilised Abyssinians, have become tillers of the soil. The wandering G. are mainly engaged in hunting and the slave-trade. The larger number of the G. are still heathens, though Mohammedanism has lately made great progress among them. Their religion bears a resemblance to that of the Kafirs.—Compare

Jomard, *Notices sur les Gallas* (Paris, 1839); Beke, *On the Origin of the Gallas* (London, 1848).

GALLATIN, ALBERT, an eminent financier and diplomatist, was born 29th January 1761, at Geneva, and educated at the university of that city. In 1780 he emigrated to the United States; and was for a short time teacher of French in Harvard College at Cambridge, Massachusetts. In 1786 he settled in the western part of Pennsylvania, and was a representative from that state in the Federal Congress from 1795 to 1801. He soon became one of the ablest debaters in that body, and was for several years the recognised leader of the Republican party. He took an active part in almost every question before Congress, and was especially distinguished for his ready and profound knowledge of political economy and finance. The first formation of the 'Committee of Ways and Means' was due to his suggestion. In 1801, President Jefferson appointed G. secretary of the Treasury, which office he filled with eminent ability during a period of twelve years. He had an important share in the negotiations for peace with England in 1814, and signed, with Adams, Clay, and the other commissioners, the treaty concluded at Ghent on the 14th of December of that year. From 1816 to 1823, G. was minister resident of the United States at Paris. In 1826, he was sent to England as ambassador extraordinary, for the purpose of settling the disputed boundary between the United States and the British possessions, and other important questions. On his return from Europe in 1827, he retired from public employment, and became a resident of New York city. In 1843, he was elected president of the New York Historical Society, which position he held till his death. He was one of the founders, and the first president of the American Ethnological Society. He was the author of a number of valuable publications on the currency and other subjects. He made the languages and characteristics of the native tribes of North America a subject of profound study, and published several papers on this department of ethnology. G. died 12th of August 1849, in his 89th year.

GALL-BLADDER. See LIVER.

GALLE'GO, one of the principal affluents of the Ebro, rises at the southern base of the Pyrenees in the province of Huesca, flows south, and after a course of about 90 miles, joins the Ebro a mile below Zaragoza.

GA'LLEON (augmentative of *Galley*), a name formerly applied to ships-of-war of three or four gun-decks, but subsequently transferred to the large merchant-vessels which every year brought to Spain the gold, silver, and other wealth contributed by its Mexican and South American colonies. They were armed, but being heavy unmanageable vessels, and of immense value, were eagerly sought after as prizes whenever a war broke out.

GA'LLERY, in a *military* sense, is a covered passage, cut through the earth or masonry in a fortification, either as a means of communication, or as a position whence a musketry-fire can be maintained through loopholes. For the latter purpose, galleries are formed occasionally in the counterscarps of dry ditches, where their defenders exercise a flanking fire upon the ditch. With regard to listening galleries, see MINES, MILITARY.

In a *naval* signification, a gallery is a sort of balcony projecting from the stern and stern-quarters of large ships. As an adjunct to the principal cabins, galleries form an agreeable resort during fine weather. Under the article DAVIT, the gallery of a man-of-war is shewn.

GALLIARD (from the French *gaillard*, and that again from *gai*, sprightly) is the name of a lively dance, the same, according to Brossard, as the *Romanesca*, a favourite dance with the Italians. The air is mostly in $\frac{6}{4}$ or $\frac{3}{4}$ time, but sometimes also in $\frac{3}{2}$ or $\frac{4}{4}$ time. The tempo is also quick and lively, with a flowing melody. A writer in *Notes and Queries* (vol. vii. pages 216, 217) says that he knows at least a hundred different galliard tunes, which are distinguished by different names, probably to indicate with whom they were favourites, such as *The King of Denmark's Galliard*; *The Earl of Essex's Galliard*; &c.

GALLIC ACID ($C_{14}H_6O_{10},2HO$) occurs in the form of colourless silky needles which lose their water of crystallisation at 212°; they dissolve slightly in cold water, but require only three parts of boiling water for their solution, and they are freely soluble in alcohol. Solutions of gallic acid have an acid reaction and a sour astringent taste; with the persalts of iron they yield a deep blue colour, and no apparent reaction occurs when they are mixed with a solution of gelatine. The gallates of the alkalies, especially if an excess of the base be present, speedily absorb oxygen, and become brown when exposed to the air; and hence they may be usefully employed in Eudiometry. Gallic acid possesses the property of reducing the salts of gold and silver, and it is on this account that it has been employed in photography.

Gallic acid exists ready formed in small quantity in gall-nuts, in valonia (the acorn-cup of *Quercus ægilops*), in divi-divi (the pod of *Cæsalpina coriaria*), in sumach, and other vegetables. It is formed in association with glycose from Gallotannic Acid (q. v.), when the latter is boiled with dilute sulphuric or hydrochloric acid; it is likewise produced by boiling a solution of gallotannic acid with caustic alkalies, or (more slowly) by simply exposing a solution of gall-nuts to the air, the process of oxygenation being apparently favoured by the presence of a ferment contained in the gall-nut.

To obtain gallic acid, we mix powdered gall-nuts with water, and expose them freely and for a long time to the air at a temperature of 70° or 80°. The tannin or gallotannic acid becomes gradually converted into gallic acid. We pour away the supernatant brown fluid, and take up the gallic acid from the residue with boiling water, decolorise with animal charcoal, and crystallise.

When gallic acid is exposed to a temperature of from 410° to 420°, it is converted into carbonic acid and *Pyrogallic Acid* (q. v.) ($C_{12}H_6O_6$), which is sublimed, 31 or 32 parts of the latter acid being yielded by 100 of gallic acid. The reaction is represented by the formula —

Gallic Acid. Carbonic Acid. Pyrogallic Acid.

$$\overbrace{C_{14}H_6O_{10}} = 2CO_2 + \overbrace{C_{12}H_6O_6}$$

If gallic acid is mixed with five times its weight of oil of vitriol, a crimson solution is formed, which, if gradually dropped into water, deposits a red substance, partly in granules and partly in crystals. The crystals are *Rufigallic acid* ($C_{14}H_4O_8,2HO$).

Gallic acid is used in medicine as an astringent. The late Dr Todd regarded it as the best styptic that we possess in all cases of internal hæmorrhage, whether hæmoptysis, hæmatemesis, or hæmaturia. The symptoms of Bright's disease of the kidney have also been much alleviated by its use. It may be given in doses of from three to ten grains three or four times a day. As a topical agent in arresting hæmorrhage from external wounds, it is greatly inferior to tannin.

GALLICAN CHURCH, the Church of France, less, however, considered under the relation of

geographical boundaries than in its constitution and principles of church government. The Christian faith was widely diffused in France, even during the lifetime of the apostles; and it especially flourished among the descendants of the Greek colonies of the south, and in the numerous towns and cities upon the Rhone and its confluent rivers. In the persecutions to which the early professors of Christianity were subjected, the Christians of these churches had their full share; and one of the most touching monuments of early Christian literature, is the letter of the Christians of Lyon and Vienne to their brethren in Asia, on the martyrs of these churches, which Eusebius has preserved in his *Ecclesiastical History* (book v. c. 1). Although sharing in the general literary inferiority to their eastern brethren which characterises Western ecclesiastics during the early period, the church of Gaul numbers several eminent names in the literature of the 3d, 4th, and 5th centuries. The works of Irenæus, Bishop of Lyon, are among the most important for the history of doctrine of all the early patristic remains; and in the following century, Sulpicius Severus, Hilary of Poitiers, Hilary of Arles, Vincent of Lerins, Prosper, Victor, Eucherius, Salvian, and other writers, combine to form a body of literature of which the later modern representatives of the French Church are not unreasonably proud. The hierarchical organisation, also, of the church of Gaul was, at a very early period, among the most complete and regular throughout the churches of western Christendom; and in the council held at Arles in 314, we even recognise the titles of many bishops of sees which are still represented in the catalogue of the French episcopacy.

But the history of the G. C., so far as regards the development of those peculiar principles which have acquired a distinctive name and status in Roman Catholic theology, begins at a much later period. We shall see elsewhere the origin and progress of the temporal power of the papacy. See PAPACY. It will be enough, in this place, to observe, that, from circumstances which are differently viewed by the opposite schools of theology, the Roman pontiffs began, from the very date of the establishment of the Western Empire, to exercise a large and widely extended influence over the civil as well as ecclesiastical affairs of the several European kingdoms. On the other hand, owing to the intimate connection between the church and state in most of these kingdoms, and especially to the feudal relations between the crown and the church dignitaries, most of whom held the temporalities of their benefices under the crown by the ordinary feudatory tenure, the crown also asserted a correlative claim to certain privileges in respect of ecclesiastical affairs. The satisfactory adjustment of these conflicting claims was the great problem of medieval polity; and the alternations of the struggle between them form the staple of medieval history. More than one of the French sovereigns engaged in a conflict with the Roman see as to the respective authority of the two powers; these conflicts naturally called out a division of opinion among the members of the church of France, one party supporting the papal claims, and the other maintaining the adverse prerogatives of the French crown, and the privileges of the national church of France. The latter party, professing to represent the rights of the G. C., have given a name to the principles which they profess; and the appellation of Gallicanism has come to designate, in general, that system in Roman Catholic theology which, while it recognises the primacy of the Roman pontiff, by divine right, over the universal church, yet asserts the independence of national churches in many details of self-government and of local discipline, and limits the exercise of the papal prerogatives by canons and decrees of general councils and by the laws of the universal church. It must be added that, while the Gallican theory to this extent claims an exemption from dependence upon the authority of the Roman pontiff, it acquiesces, on the other hand, to an almost proportionate degree, in the assumption of ecclesiastical authority on the part of the state. Gallicanism, in truth, in many of its details, falls into the grossest form of Erastianism.

We can recognise the working of these principles in the opposition which the so-called Isidorian Decretals (see ISIDORIAN DECRETALS, HINCMAR OF RHEIMS) encountered in France; and although the body of the clergy stood aloof, they were carried to their most extreme extent by Philippe the Handsome in his contest with Boniface VIII. The conflicting claims of the rival popes in the Western Schism (see WESTERN SCHISM) tended still more to weaken the papal authority; and the expedient which was then adopted for the extinction of the schism—viz., that of convening a general council to pronounce upon the respective claims of the pretenders to the papacy, gave prominence and significancy to what has since been regarded as one of the leading dogmas of Gallicanism—the superiority in point of authority of a general council to the pope. The details, too, of the disciplinary enactments of the councils of Constance and Basel, which were drawn up in this spirit, were mainly directed towards the limitation of the papal authority in the exercise of church patronage within the limits of the national church; and these enactments were in the main embodied into the French law by the celebrated Pragmatic Sanction of 1438. See PRAGMATIC SANCTION.

The Pragmatic Sanction was superseded in 1512 by the concordat of Leo X. with Francis I. The large share in the dispensation of church patronage which the French crown enjoyed under that concordat had the effect of still further nationalising the French Church, and increasing the jealousy of the crown as to the papal interference. The great jurists, Pithou and Duping, in asserting the liberties of the church, equally enforced the privileges of the crown. In the development of the absolutism of the monarchy, which reached its height under Louis XIV., the ecclesiastical prerogative of the crown was enlarged as much as its political authority; and a contest which arose between this monarch and Innocent XI., on the right of the crown to the so-called *Droit de Regale* (see REGALIA), led to the well-known declaration of the French clergy in 1682, which has since been regarded as the charter of Gallicanism. This formulary emanated from an assembly of the French clergy, held by royal authority in 1682, at which the celebrated Bossuet was present. It consists of four articles. The first declares that 'the jurisdiction of St Peter and his successors in the Roman see as vicars of Christ on earth, although divinely bestowed, is confined to things spiritual and appertaining to salvation, and does not extend to civil or temporal affairs.' The article therefore declares 'that princes are not subject in temporal things to any ecclesiastical authority;' that they cannot be deposed 'either directly or indirectly by the power of the keys, and that their subjects cannot be dispensed from their subjection or released from their allegiance.' The second article renews the declaration of the council of Constance with regard to the superiority of a general council over the pope, and declares that that article is not to be restricted in its application to a period of schism such as existed at the time of the council. The third asserts that the authority of the pope is 'to be restricted by the

the universal church,' and that 'the rules, and institutions of the Gallican kingdom h remain in full force.' This is the article serts the celebrated 'Gallican Liberties.' th article, while it concedes to the pope f part in questions of faith,' and professes decrees extend to each and every church,' ess maintains 'that his judgment is not ble, unless it shall have been confirmed by ut of the entire church.' The chief rules, and institutions of the G. C. referred to ird article are, that the G. C. does not ll the decrees of councils and of popes in f discipline, and that those only are in ch are so received; that the G. C. holds e to receive or reject the rules of the hancery; that the Roman pontiff cannot impost from the French clergy without n consent; that he cannot bestow of his on on a foreigner any benefice within the hurch; that neither he nor his legates can ch causes in 'the first instance,' and that ases of appeal he is bound to assign native hear the appeal, even when the appellant e a metropolitan or primate; that the ishops shall not be required to attend any ouncil unless with the permission of the The last of these 'customs,' as also those ake the receiving or not receiving the anons of discipline optional in France, h practically throw the decision into the the civil power, have been with much reason denominated the 'Slaveries' rather 'Liberties' of the Gallican Church.

Declaration' was strenuously enforced by V. It was imposed upon the universities ublic ecclesiastical bodies, and its accept- made a condition of appointment to offices urch; but it was in the same proportion il to the popes. It was condemned by r VIII. in 1690, by Clement XI. in 1706, n by Pius VI. in 1794; but both the e of the articles by the French clergy, and emnation of them by the Roman pontiffs, stood to be with certain reservations as to ular doctrines. Within the present cen- especially since the late collision between and ecclesiastical authority, the opinions rench clergy have undergone a decided The Gallican doctrines are now much less y held, and in a less extreme form. The trines were also adopted in other national , and especially in the ecclesiastical princi- f Germany (see FEBRONIANISM), and in the empire under Joseph II. Here, also, they en into discredit with the church party.

. C. underwent very extensive modifications lose of the 18th and the beginning of the entury, not merely by the enactment of as called the 'civil constitution of the and which introduced into the constitution urch a large infusion of the presbyterian, a the democratic element, but by the con- Pius VII. with Bonaparte as First Consul, educed the number of sees, brought the tical divisions of the country into harmony new political distribution into departments, ed the number of festivals, and confirmed ression of the ancient religious establish- nd the confiscation of the church property ou France. Under the present emperor, rch of France has recovered somewhat of external prestige. Compare De Maistre's se Gallicane; Dupin, *Les Libertés de l'Eglise* (Paris, 1824); and Fraysinous, *Les Vrais de l'Eglise Gallicane*

GALLIE'NUS, PUBLIUS LICINIUS, a Roman emperor from the year 259 A.D.—when his father Valerian, who had made him co-regent with himself, was taken prisoner by the Persians—to 268 A.D. His authority was limited almost entirely to Italy, for throughout the provinces the legions for the most part revolted, and raised their commanders to the dignity of Cæsars. Hence the period is known in history as the Time of the Thirty Tyrants. In the East, the honour of the Roman arms was maintained by Aurelian, Probus, and others, who found a useful ally in Odenathus, ruler of Palmyra, and his wife Zenobia (q. v.), to whom G. intrusted the care of the war against the Persians. In the West, however, dangers thickened about him. Aureolus was proclaimed emperor by the legions of Illyricum, and having marched into Italy, seized Milan, and proceeded towards Rome. The war between the two was carried on for some time with undecided success, but G., while besieging his adversary in Mediolanum (Milan), was murdered by some of his officers, 268 A.D. He was succeeded by Claudius II.

GALLINA'CEOUS BIRDS (Lat. *gallus*, a cock), or RASORES (Lat. scrapers), an order of birds, more generally valuable to man than any other order, containing at once the most important species domesticated as poultry, and those most sought after as game. The common Domestic Fowl may be regarded as the type of the order. Like it, the gallinaceous birds in general have a small head; a rather short bill, with the upper mandible a little arched; nostrils placed on the sides of the bill, and usually in a soft membranous space at its base; the figure bulky; the wings short, and not governed by powerful muscles, nor adapted for long or rapid flight; the feet with three toes before, and one behind—which is articulated higher than the others, and is sometimes wanting—adapted for walking on the ground and for scraping, which is much resorted to, in order to procure food and for other purposes; the digestive organs complex, the *crop* large, the *gizzard* very muscular, the *intestine* long, with two very large *cæca*. The head, at least of the males, is very generally furnished with appendages, as a crest, comb, wattles, &c. The feet of the males are also often furnished with *spurs*, and at least during the breeding season the males are very quarrelsome. The males of many species are birds of splendid plumage; that of the females is sober, but females of very advanced age often assume a plumage similar to that of the males. Some of the gallinaceous birds are polygamous, some pair at the breeding season; the nest of all of them is artless, and the males take no part in incubation, nor in the rearing of the young. The young are comparatively feathered when hatched, and are immediately able to run about and pick up food for themselves, but are for some time most affectionately tended and protected by their mother, and by her the proper food is sought for them and pointed out to them, or broken into sufficiently small pieces, and laid before them. The gallinaceous birds have unmelodious voices. Except the curassows, they make their nests on the ground. Some of them are found in almost all parts of the world. Besides those already named, guans, pheasants, grouse, partridges, quails, ptarmigans, peacocks, turkeys, guinea-fowls, tragopans, and tinamous, may be mentioned as examples of this order. Pigeons are generally ranked in it by ornithologists, but rather doubtfully, as they differ not a little from the true gallinaceous birds. See COLUMBIDÆ. Interesting analogies have been pointed out between this order of birds and the order of Ruminants among Mammals, in the complexity of the digestive organs, bulkiness of the frame, low intelligence, easy domestication, usefulness to man, and proneness

to variation from the influence of external circumstances, giving rise to different breeds.

GA'LLINULE (*Gallinula*), a genus of birds of the family *Rallidæ*, closely allied to the Coots (q. v.), and having the upper mandible similarly extending on the forehead in a naked soft plate, but the toes furnished with an undivided narrow marginal membrane. This membrane, however, and the great length of the toes, enable the gallinules to swim well, and all of them are aquatic. The species are pretty numerous, some of them confined to tropical regions. One only is found in Britain, the COMMON G. (*G. chloropus*), also known as the WATER-HEN, or MOOR-HEN. It is a very widely diffused species, being found in most parts of the world. The G. is about 13 inches in length, the tail very short; the general colour of the plumage deep olive brown on the upper parts, blackish gray beneath, the ridge of the wing and the under tail-coverts white. The bill is red at the base, and yellowish green at the tip; the legs and toes green. In situations favourable for them, such as artificial ponds, gallinules may often be seen in considerable numbers together, swimming with a peculiar nodding motion of the head. They seek their food both on the surface of the water and by diving, partly also among the grass of meadows and river-banks. A frequent jerking of the tail is very characteristic of them. When alarmed, they sometimes seek safety by flight, but more frequently by hiding among rushes or reeds. They make their nests near the water which they frequent, and usually on the ground among stumps, roots, and reeds; the nest contains from seven to ten eggs. The flesh of the G. is well flavoured.

GA'LLIOT, a Dutch vessel carrying a main and a mizzen mast, and a large gaff-mainsail. Galliots—

Dutch Galliot (from the *Boy's Own Book of Boats*).

strong-built, flat-bottomed ships—of 400 to 500 tons burden, were formerly used also as bomb-vessels.

GALLI'POLI (the *Callipolis* of the Greeks), an important commercial town of Italy, in the Neapolitan province of Terra di Otranto, is beautifully situated on the eastern shore of the Gulf of Taranto, on a steep insulated rock in the sea, connected with the mainland by a fine arched bridge of stone. It has a good harbour, although somewhat difficult of access, owing to the rocks surrounding its entrance, and in time of war is an important position, being strongly protected by fortifications and a castle, as well as by the peculiarity of its site. G. is remarkable for its oil-tanks, excavated in the solid limestone, in which the famous oil of Puglia is deposited for exportation. Pop. 10,653. It is the see of a bishop. In 1834, the revenue from the oil-trade amounted to 8,187,355 francs. Other interesting features of the place are the ancient fountain, a fine monument of antiquity, and adorned with antique figures in bas-relief; the castle, erected by Charles of Anjou, commanding the port and bridge, and possessing considerable defensive strength; and the cathedral, erected in 1629 by Francesco Bischettini, and containing some fine paintings of Coppola.

It is said that Christianity was introduced here as early as 44 A. D. In 450, the town was sacked by the Vandals; in 1284, it was destroyed and almost depopulated by Charles of Anjou; and during subsequent centuries, suffered severely from the Venetians, French, Spaniards, and Turks. See *Viaggi in Sicilia ed in Gallipoli*, by Baron Riedesel.

GALLIPOLI, PENINSULA OF (the ancient Thracian Chersonesus), a portion of the province of Rumili, in European Turkey, is situated between 40° 3′ and 40° 38′ N., and separates the strait of Dardanelles on the east from the Gulf of Saros on the west. It extends in a south-west direction, is about 55 miles in length, and varies from 4 to 13 miles in breadth. The principal town on the peninsula is Gallipoli (q. v.).

GALLIPOLI, an important town and seaport of Turkey in Europe, in the province of Rumili, is situated on the peninsula of the same name, at the north-eastern extremity of the strait of the Dardanelles, and is 90 miles south of Adrianople, and about 130 miles west-south-west of Constantinople. It was once fortified, but its only defence now is 'a sorry square castle with an old tower.' G. is poorly and irregularly built, its houses miserable, and its streets dirty, but its bazaars are extensive and well stocked. It is the most important town on the Hellespont, has two ports, and numerous fountains and mosques; and its inhabitants, comprising merchants of all nations, carry on a flourishing trade in corn, wine, oil, &c. Pop. 30,000.

G. is the see of a Greek bishop. In the town and neighbourhood are seen many remains of ancient sculpture and architecture, the most noteworthy of which are the magazine and cellars built by Justinian. The town was taken by the Turks in 1357, and formed the earliest Turkish possession in Europe.

GA'LLIPOT, the name given to a pot painted and glazed, commonly used for medicine. The origin of the name is uncertain, some deriving it from the Dutch *gleye*, clay, or *glei*, glaze, and others from the Spanish *gala*. There seems to be some doubt whether the word 'galley' does not apply to the shape. Glazed coloured tiles, however, were called 'galletyles.' The earliest mention of gallipots is in Sir T. Howard's Household Book of the year 1465, edited by the Roxburghe Club, *Archæol. Jour.* 1861, p. 138.

GA'LLIVATS, large row-boats, formerly, and still to some degree, used in eastern waters. They rarely exceed seventy tons, carry two masts with high triangular sails, and are generally armed with a few small swivel guns, fastened on the bulwarks. The Malay pirates employ these swift but somewhat fragile vessels.

GALLOMA'NIA. See ANGLOMANIA.

GALLON, the standard measure for liquids and dry goods throughout the United Kingdom. It has existed as a measure from the earliest times, and, in consequence, has undergone many changes. In the time of Henry III., it was enacted that the gallon should be 8 lbs. of 12 ounces each, an ounce being

ght of 640 dry grains of wheat from the
f the ear.
50, there were three distinct gallon measures
, the gallon measure in common use, which
d about 231 cubic inches: 2, the customary
l at the Guildhall, which, though not a
andard, was frequently referred to as such,
the law-officers of the crown; and though
y estimated at 231 cubic inches, in reality
d only 224: 3, there was also the legal
l measure, preserved at the Treasury, which
d 282 cubic inches.
es these three, there was another gallon
frequently employed for measuring corn,
ie Winchester gallon. This measure, though
in William III.'s reign to contain 269 cubic
was soon afterwards changed to 272¼ cubic
at which value it remained for a long

06, the gallon of 231 cubic inches was made
dard wine gallon.
measures were gradually changed in value,
ropriated to the measurement of particular
es, till, in 1825, just before the passing of
t for Ascertaining and Establishing Uni-
of Weights and Measures,' they stood thus:

or corn measure,	the gallon	= 268·6	cubic inches.		
ie measure,	"	"	= 230·85	"	"
and beer measure,	"	"	= 282	"	"

ıary 1826, when the above-mentioned act
ato operation, all these measures were
d, and it was enacted that the standard
of capacity for all liquids and for dry
ot measured by heaping, shall be a gallon
ng 10 lbs. av. of distilled water, weighed
the barometer being at 30 inches, and the
ıeter at 62°).
gives 277·274 cubic inches for the imperial
nd by subdivision or multiplication of this
l, the other measures can easily be found.
IGHTS AND MEASURES.

LOO'N, a narrow fabric composed of silk
ed, or of both. It is usually employed for
garments, curtains, &c. The small band
ınd gentlemen's hats is an example.

LOTA'NNIC ACID ($C_{54}H_{22}O_{34}$) is the
portant of the various forms of tannin or
cid. It usually occurs as a spongy, light,
ıs, colourless, or faintly yellow mass, which
reduced to a fine powder, which possesses
ly astringent, but not a bitter taste. It
soluble in water, the solution reddening
ıper, and dissolving the carbonates with
ence. With the persalts of iron, gallotannic
s a blackish blue precipitate of gallotannate
ınd even when the iron solution is extremely
violet tint is evolved. This gallotannate
s the basis of ordinary writing ink (q. v.);
reaction that we have described is so
, that gallotannic acid is employed in the
ry as a test for the detection of the persalts
Gallotannic acid likewise precipitates tartar
ıearly all the vegetable alkaloids (morphia,
:c.), the albuminates, and gelatine. If a piece
hide, freed from hair, be immersed in a

acid combine, and leather is formed; and if
be of sufficient size, all the gallotannic acid
ed from the solution.
annic acid fuses when exposed to heat, and
ıperature of about 120° it is decomposed,
ds pyrogallic acid ($C_{12}H_6O_6$) and meta-
id ($C_{12}H_4O_4$), while water and carbonic
expelled. When a watery solution of
ıic acid is excluded from the air, it remains
unchanged; but if the air is allowed free access
to it, a fungous or mouldy growth is developed,
oxygen is absorbed, carbonic acid is given off, and
the gallotannic acid becomes decomposed into Gallic
Acid (q. v.) and sugar. The same decomposition
is more rapidly induced by the action of dilute
sulphuric acid, the reaction being exhibited in the
following formula:

Gallotannic Acid. Water. Gallic Acid. Sugar.

$$\overbrace{C_{54}H_{22}O_{34}} + \overbrace{8HO} = \overbrace{3(C_{14}H_6O_{10})} + \overbrace{C_{12}H_{12}O_{12}}$$

On boiling gallotannic acid in a concentrated solution of potash, gallic acid is also formed.

The composition of the salts of this acid is but imperfectly known, but the acid is generally considered as tribasic. None of the salts crystallise, and when in solution or in a moist state, they rapidly absorb oxygen, and become decomposed.

Gallotannic acid occurs in large quantity in the gall-nut, which contains, according to Pelouze, as much as 40 per cent. of this acid, and 3·5 per cent. of gallic acid (Guibourt has found that some nuts contain as much as 65 per cent. of gallotannic acid); it is likewise found in all parts of the gall or dyer's oak (*Quercus infectoria*), in sumach (*Rhus coriaria*), and in green tea.

The best method of obtaining it is from powdered gall-nuts, by extraction with commercial ether (which contains about 10 per cent. of water), in the percolation or displacement apparatus.

Gallotannic acid is employed in medicine, in chemistry, and in the arts. Its uses in medicine are due to its powerful astringent action. It is employed topically as a styptic in wounds, bleeding gums, piles, &c., and internally as an astringent in hæmorrhage from the lungs, stomach, bowels, &c.; as we know that it becomes converted into gallic acid in its passage through the system, it is probably the latter acid which acts on remote parts when gallotannic acid is administered. Internally, it may be given in doses of from three to ten grains, three or four times a day, in pills or in solution. It may be used as an astringent gargle or lotion, in the form of a watery solution containing three or more grains to the ounce. The *compound ointment of galls*, which is the best topical remedy for piles without hæmorrhage, owes its efficacy to the gallotannic acid contained in the powdered galls.

In chemistry, it is used in solution as a test for gelatine, persalts of iron, &c.; and in the arts, it serves various useful processes, especially in relation to the preparation of leather, and the manufacture of white wines.

GA'LLOWAY, the name of an ancient province in the south of Scotland, still employed to designate the counties of Kirkcudbright and Wigton. The extent and early history of G. are alike obscure. By some historians, it has been asserted to have comprehended, in addition to Kirkcudbright and Wigton, Nithsdale, Annandale, Teviotdale, Carrick, Kyle, Cunningham, and Renfrewshire; but the evidence for such assertion is not satisfactory. Gallwegia is mentioned in 1124, in a charter granted by David I. of Scotland to the monks of Selkirk, and at that time its dimensions appear to have been no larger than those the modern application of the name implies. Of the eight tributary princes who are said to have waited upon Edgar king of England at Chester, in 973, one was 'Jacobus rex Galwalliæ.' The name, however, must have come into use after the time of Bede the historian (died 735), for in speaking of the province, which then formed part of the Bernician or Northumbrian kingdom, he makes no mention of it. Its origin is doubtful, but has obvious reference to the Gaelic

people by whom it was possessed. The original inhabitants of the country appear to have been of Celtic origin; they are believed to have formed two distinct tribes, the Selgovæ and Novantes—the former holding the country east of the Dee, along with a portion of Dumfriesshire, while the latter held the portion lying to the west. After the departure of the Romans, in the first half of the 5th c., G. was overrun by the Anglo-Saxons of Northumbria, by whom, however, the native Celtic inhabitants do not appear to have been ever thoroughly subdued. About the 12th c., G. is spoken of by English writers as 'the land of the Picts,' and its inhabitants as 'the Picts.' In Scottish charters, the inhabitants were called simply 'Gallovidienses,' or men of Galloway. G. was now ruled by its own princes and its own laws, the kings of Scotland, however, exercising a nominal sovereignty over it. It was not until the reign of Alexander II. that the power of these great chieftains was completely broken by the crown. The last of them, Alan of Galloway, constable of Scotland, died in 1233, when his great possessions were divided among his three daughters. For the extent, population, natural productions, &c., of G., see KIRKCUDBRIGHTSHIRE and WIGTONSHIRE.

GALLOWAY, MULL OF, a rocky headland, the southern extremity of the peninsula called the Rinns of Galloway, in Wigtonshire, is the most southern point of Scotland. It is 1½ mile long, and ½ of a mile broad. On this headland, in lat. 54° 38′ N., and long. 4° 52′ W., is a light-house, 325 feet above the level of the sea, the light of which is seen at the distance of 21 nautical miles.

GALLOWS, PIT and G. See FOSSA ET FURCA; also, EXECUTION, HANGING.

GALLOWS-BITS, the name applied on board ship to two strong frames of oak, on which the spare topmasts and yards are lashed.

GALLS, or GALL-NUTS, are of various shapes, but the oak-galls chiefly used in commerce are nearly globular, with slightly pointed excrescences sparingly placed on their surface. They are remarkable for containing a peculiar acid called *gallic*, which is only an altered condition of tannic acid, and their value is entirely due to the great accumulation of this principle in the diseased condition of the vegetable tissue which constitutes the gall. This gallic acid (q. v.) is easily separated in the form of beautiful white acicular crystals, which, after a little exposure, become pale yellow. It is in extensive demand as a fixing agent for photographic pictures. Until this demand was created, only three or four kinds of galls were known in commerce, and these were almost wholly employed for dyeing purposes, a small quantity of the common Turkish galls being also used medicinally; now, several others are imported in considerable quantities. The following are the chief:

1. The Turkish galls, of two kinds, *blue* and *white;* these are by far the most common in use. They are chiefly imported from Constantinople and Smyrna, from which places the average imports of the last five years have amounted to 300 tons—an enormous quantity, when we consider how they are produced, and the industry necessary to collect so vast a quantity. They are each about the size of a round nutmeg, and the blue, which are the best, are entire, being gathered before the escape of the insect. The so-called white galls are of a yellowish-brown colour, and each is perforated with a small round hole, about the sixteenth of an inch in diameter, whence the insect has escaped. These galls are produced by a species of Cynips (*C. quercus-galli*) on the dyer's oak (*Quercus infectoria*), a native of Asia Minor, from the Bosphorus to Syria, and from the Grecian Archipelago to the frontiers of Persia. Of this kind of gall, several varieties are known in commerce, as the Aleppo galls; the Syrian or Mosul galls, which are the best known; the Tripoli Taraplus or Tarablous galls, obtained from Constantinople; and the Smyrna galls.

2. The small Aleppo or coriander gall, which is generally about the size of a large pea. They are always perforated or empty galls, and are of a brownish-yellow colour, round, and with small blunt spines. The quantity used in this country is not very large.

3. The large Bassorah, Bussorah, or Mecca galls, which are the largest galls known in commerce; they are as large as an Orleans plum, smooth, except a ring of curious slightly raised excrescences sometimes found round the middle, dividing the gall into two hemispheres. They are reddish brown, and are said, when on the trees (*Quercus infectoria*), to be coloured as brightly as apples. These are the apples of Sodom, or the Dead Sea apples, bright to the eye, but filled with a gritty astringent matter, which is likened to ashes; it is formed on the *Quercus infectoria* by *Cynips insana*. These are not extensively imported.

4. The acorn gall, Knoppern, Knobben, Hungarian, or German gall. This is found chiefly in Hungary, and is much used by the German dyers; it is also occasionally used in this country. It is a curious irregular-shaped brown gall, deeply furrowed, and covered with angular excrescences. It is produced on the common oak (*Quercus pedunculata*) by *Cynips Quercûs calycis*.

5. The small East Indian galls called Mahee, and Sumrut-ool-toorfa, are obtained from the Indian Tamarisk (*Tamarix Indica*). They are very small, about the size and colour of tares, and are so rough and irregular in form, that they look rather like little lumps of dried garden-soil.

6. The Chinese galls, or Woo-pei-taze. These very curious vegetable excrescences were regarded only as curiosities ten years since, but they now form regular articles of commerce. They are of a very irregular shape, branching out sometimes like fingers. Their length seldom exceeds two inches: they are rarely more than a quarter of an inch in diameter at the base, where they spring from the tree, but they spread out as much sometimes as an inch and a half to two inches. When broken, they are found to consist of a thin shell, not thicker than a walnut-shell, of a dark-yellowish or reddish-brown colour internally, and semi-transparent; but externally they are covered with very fine down, and consequently look like the young horns of a stag when just budding. They are produced on the *Rhus semi-alata* (see SUMACH), by an insect not yet known to science. Since the Japanese ports have been opened to British commerce, considerable imports of these curious galls have been received from that country. They are rather more branched, the branches or lobes being smaller than in the Chinese variety, but in all other respects they are identical.

A very great many galls are known in most parts of the world, and in our own country the oaks yield numerous species, but those above enumerated are the galls of commerce: few others have ever been found to pay the expense of collecting. Galls are extensively used in dyeing, chiefly for the production of black colours, with logwood and the salts of iron, either for dyeing in the piece, or printing patterns; in each case, the material is first submitted to the action of a solution of the galls, and afterwards to another of the dye-wood and iron salt. They are also an important constituent in writing-ink (see

ne), and are used in tanning the finer kinds of fancy leathers.

GALL-STONE. See CALCULUS, BILIARY.

GALOCHES. See GOLOSHES.
